N. 1508 d. 1

CONTENTS.

VOL. XXVI., NEW SERIES. VOL. LXXVII., OLD SERIES
JULY TO DECEMBER, 1878.

A

Abdomen, tumour in, 495
Aberdeen, university of, 240, 261, 526
Abdominal section in intestinal obstruction, 433
Abortions, 325
Abortion, criminal, 418
Abscess, cerebral, hemiplegia from 349
Abscess of lower lip, 151
Abscess, pulsating popliteal, 331
Abuse of dispensary relief, 303
Academy of Medicine, Paris, 353
Acute peritonitis, 208
Acute rheumatism, 27
Adelaide hospitals, the new, 462
Adulteration act, the, 524
Adulteration act, flaw in the, 47
Adulteration of drugs, 140
Adulterated milk, 510
Adulterators triumphant, 419
Afghanistan, doctors and war, 357
Alarming death-rate of Dublin, 460
Alcohol, 385, 422, 505
Alcohol in some clinical aspects, 370
Alcohol in the Arctic regions, 34
Alcohol, mortality referable to, 448, 455
Alcoholism, chronic, 443
Algerian remedy for hydrophobia, 358
Alice, death of the Princess, 502
Althaus, Dr., infantile paralysis (Review), 114
Ambulance department, volunteer, 382
Ambulances, fever, 341
American doctors, 50
Ammonium, chloride of in the treatment of hepatic disease, 47
Anæsthesia by rapid respiration, 116
Anatomical preparations for museum and class purposes, 92
Anderson's college, 529
Aneurism in the army (Review), 463
Aneurism, popliteal, 496
Ankle, amputation of, 84
Anonymous journalism, 440
Ants, the toilet habits of, 133
Anthropological specimens, 24
Anti-pyretic and heroic treatment of fevers, 375
Antidote to carbolic acid, 192
Anti-vivisectors and their tactics, 394, 464, 576
Anus, strumous disease of, 408
Aphasia and ataxia of syphilitic origin (Review), 194
Apothecaries' measures, legalisation of, 210
Apothecaries' society v. Shepperley, 396
Apothecaries' society of London, 225
Appendix cæci, perforation of, 497
Arctic region, alcohol in the, 34
Army medical department, 136, 186 207, 213, 253, 312, 354, 400, 409
Army medical service, 111
Arsenic in food, poisoning by, 150
Artificial feeding of infants, 69
Artisans' dwellings acts, abuses under the, 93
Assistant wanted by a dispensary medical officer, 364
Assistant, a dangerous, 30
Athy union, 532
Atmospheric organisms, 258
Australia, phthisis in, 279
Avoidance of pain, 161

B

Bartlett, Mr. H. C., chemistry of dirt, 308; poisonous and non-poisonous wall-papers, 369
Belladonna as a cardiac and respiratory stimulant, 169
Belladonna, 420
Benevolent societies, district medical, 63
Birmingham medical institute, 343
Blackburn and East Lancashire infirmay, a new rule at the, 289
Bladder, supra-pubic incision into the, 351
Blind, asylums for the, 461
Blood, condition of CO_2 in the, 46
Boddy, Mr. E. M., hydropathy, 37, 58, 81, 103
Boldo, uses of, 91
Botany, study of medical, 151
Boy smoking, 503
Bradley, Mr. S. M., intra-cranial abscess, 97; genu valgum, 428
Bread pudding, fatal poisoning by eating, 333
Breast amputation, 408
Breasts, management of the, 321
Breasts, enormous hypertrophy of, 445
Breast, removal of, 84
British Association, 461
British association in Dublin, 115
British medical association at Bath, 123, 125
British pharmaceutical conference, 134, 152
Bristol, typhoid epidemic at, 130
Broadbent, Dr., double empyema, 472
Browne, Mr. L., the throat and its diseases (Review), 155; forms for taking throat and aural cases, 526
Brompton hospital, 457

ON PRESSURE WITHIN THE EYE, AND THE PHENOMENA CONNECTED WITH IT.

Analysis of a Communication addressed to the "Gazetta del Cliniche," of Turin, by Dr. Louis Girola.

Translated by ARCHIBALD H. JACOB, M.D. Dub., F.R.C.S.,
Formerly Ophthalmic Surgeon to the City of Dublin Hospital, and to the Dublin Eye and Ear Infirmary.

Having noted the differences of resistance of the various integuments of the eye, M. Girola examines the different degrees of pressure of the humours. The strongest pressure is exercised by the vitreous humour, which has a density of 12·5 millim., while the aqueous humour has a density only of from 2 to 3 millim. Between these two liquids there is a division which prevents communication; it is formed by part of the crystalline lens. This lens is, in reality, a movable partition, extending beyond the "Zonule of Zinn;" the ciliary processes which are in relation with its anterior surface constitutes a species of circle, which surrounds it on all sides. It, with the iris, is in a condition of unstable equilibrium between the pressure exercised by the aqueous and that exercised by the vitreous humour. If the more powerful pressure be exercised by the vitreous humour, the crystalline lens and the iris are pressed forward, and the extent of the interior lessens. This occurs in glaucoma, in cases of paracentesis, of perfo ration of the cornea, and may it not also be produced by "procidence de l'iris?"

If, on the contrary, the humours accumulate in the anterior chamber the crystalline draws back, as in serous iritis, on account of the loss of equilibrium between the pressure of the two humours. This movement forward or backward of the crystalline has been laid down by Girola. If, by means of Pravaz's syringe, water or any other liquid be injected into the eye of a subject, the iris and the crystalline lens will be pressed forward, and in cases where the aqueous humour was present to a small extent only, as when evaporation has unfortunately taken place, the iris may be pressed forward to such an extent as almost to touch the cornea. If, on the contrary, water be injected into the aqueous humour, the iris will be pressed back to a distance of several millimetres. The result is that the iris takes the form of a funnel, of which the narrow end points forward or backward, according to the direction in which the action takes place. In cases of extreme tension Girola has even remarked rupture of "zonule de Zinn," accompanied by luxation of the crystalline lens. The aqueous humour would, in addition, exercise a mechanical action on the iris itself. Girola has, on this subject, appealed to the report of Dr. Reymond ("Revue sur l'Atrophine"). The iris being dilated by means of this substance, if ocular paracentesis be practised the pupil will suddenly contract, and will only dilate on the reproduction of the aqueous humour.

From these facts the author is led to believe—and in this he agrees with the celebrated specialist Mosso—that the movement of the iris would depend, in part, at least, on the vascular state of this membrane; that the contraction of its vessels would be constantly accompanied by mydriasis, and their dilatation accompanied by myosis; that, in ocular paracentesis, the myosis would arise from the diminution of intra-ocular pressure; the peri-vascular pressure decreasing, the tortuous vessels of the iris dilate and stretch out, while the opening of the pupil contracts.

Having thus examined the alterations in form which intra-ocular pressure produces on the different envelopes of the eye, the changes of position occasioned by it, and the part which it plays in general in diseases of the organ, Dr. Girola proceeds to examine the relations between this pressure and the intra-ocular circulation. In order that the circulation be regular it is necessary that certain relations should exist between the intra-ocular pressure and the intra-vascular pressure, and the latter will necessarily be superior to the former in proportion to the amount of blood introduced. Thus, then, the stronger the arterial pressure in comparison with the intra-ocular pressure, the greater will be the influx of blood into the eyeball. This is, in fact, what follows after many operations, such as paracentesis, iridectomy,

and cataract. Cases have even been observed where it has produced true hæmorrhage in the interior of the organ, especially when the vascular walls had been changed by disease.

Per contra, the greater the intra-ocular pressure in proportion to the arterial pressure, the more difficult it will be for the blood to pass into the vessels. This may occasion atrophy, as in many cases of choroiditis, and of posterior staphyloma.

These changes, or variations of internal pressure, have been observed, even in the normal condition. According to Girola, in "systole" the blood would flow into the eyeball, with augmentation of pressure; in inspiration it diminishes. Other phenomena, too, might be produced; thus, in a normal condition there would be no pulsation in the arteries, but it would be observed in the veins.

When there is increase of pressure, occasioned either by some disease of the organ, or by artificial pressure, it has been observed—firstly, that the venous and arterial circulations become laboured; secondly, that excess of pressure flattens the veins, interrupting the course of the blood by temporary congestion, or even leads to the suspension of circulation in the arteries, thus seriously interfering with the circulation of blood in the eyeball.

Girola gives it as his opinion, that on account of the richness of the vascular system of the eye, venous congestion of the eye must be rather frequent; the augmentation of pressure on the one hand, sufficing in itself to compress the veins, the congestion of the veins on the other hand, producing increase of pressure; for the veins swelling, occupy greater space. The author calls attention on this subject, to the fact that anything liable to interfere with the free circulation of the blood, interferes also with that of the eyeball. He condemns the use of tight neckties, and condemns also sedentary employment; he approves of the new system of treatment which has been adopted for diseases of the eye; he recommends especially gymnastics, exercise, and an active life; he condemns the use of setons, the abuse of dietary, and venesection. According to the opinion of the author, both disorders of the circulation, and variations of intra-ocular pressure, exercise the most powerful influence on the phenomena of nutrition; that is to say, on secretion and absorption; he admits, however, that there are still many obscure points in the study of these phenomena.

Before following the writer any further in his demonstrations and examinations of the relation existing between intra-ocular pressure and the mechanism of accommodation, it will be perhaps useful to explain what opthhalmists understand by the word accommodation.

They designate thus the active working of the faculty of vision: the eye in its normal condition can perceive objects at a minimum distance of 4, 6, or 8 inches (near point), and at an indefinite distance (far point). It follows, therefore, that when the object is at the farthest point of distinct vision, the eye is in a state of repose (static refraction), but when it is approaching, the eye is in a state of activity (dynamic refraction). This is due to a peculiar mechanism, to the action of one muscle in particular,—the ciliary muscle, which is formed of three species of fibres, longitudinal, plexiform, and circular. These fibres contracting, and their fixed points being near the canal of Schlemm, make tense the choroid. On account of this tension, the vitreous humour is compressed, and its pressure augmented, while on the other hand, on account of the contraction of the circular fibres of the ciliary muscle, the crystalline is compressed in like manner, the ciliary muscles acting as compressing pads. In this manner, the convexity of the anterior surface of the crystalline increases, and the radius of the curvature of this surface is reduced to 6 millim., while, when in a condition of static refraction, it has a radius of 10 millim.

As to the convexity of the posterior surface, it is but slightly augmented; the radius of its curvature 6 millim., is reduced at most to a radius of 5·5 millim.

To the preceding considerations we must further add that the iris recedes and contracts, compressing besides by means of its margin the periphery of the crystalline lens, in such a manner that the centre of this lens is pressed forward. The anterior surface of the crystalline also approaches the cornea, in fact, while, in static refraction, the internal area of the eye between the anterior surface of the cornea and the surface of the crystalline equals 3·6 millim., in dynamic refraction it equals 3·2 millim.

The range of accommodation $\frac{1}{A}$ may be represented by the formula $\frac{1}{A}=\frac{1}{P}-\frac{1}{R}$, P being equal to the nearest point, R to the farthest point.

This mechanism of accommodation, with the changes occasioned by it, augments the pressure of the vitreous humour, and even that of the aqueous, which is still further compressed by the crystalline approaching the cornea; from this it clearly results that in cases of visual accommodation the intra-ocular pressure will be considerably augmented. According to Girola, not only would the intra-ocular pressure be augmented, but it would also be exercised in its greatest intensity in the direction of the axis of vision. If we consider the fact, that, during the process of accommodation, the ciliary muscle forms a kind of girdle extending from the periphery of the cornea to the equator of the eye, and that at this point it opposes, by means of its contractability, a force contrary to the dilative force of the liquids, it will be observed that the action of these latter will be exercised more energetically in the direction of the antero-posterior diameter, and particularly at the posterior pole. A result analogous to this may be obtained by taking a bladder filled with water, and pressing it with a ribbon at its anterior equilatorial part; it will then become evident that the pressure attains its highest degree of force in the antero-posterior direction. From the increase of tension in the eyeball, above all in the antero-posterior direction, the author draws the conclusion that the augmentation of pressure occasioned by the efforts made for accommodation would play a principal part among the cases of myopia. This opinion appears to us to be admissible only within certain limits. In the meantime, according to Girola, in most cases of myopia the existence of staphyloma, of posterior hernia of the sclerotic, may be proved by means of ophthalmoscopic examination; the effect of these is to augment the antero-posterior axis in such a manner that the normal dimension of $\frac{22}{24}$ millim. is increased to a dimension of $\frac{25}{24}$ millim.

The reflection of objects is then no longer produced upon the retina, but in front of it, the retina being struck only by confused images, on account of the posterior circles due to the diffusion of light. In proportion as the membranes give way under the influence of the intra-ocular pressure, they become thin, and their atrophy causes still further distension, the distension increasing in proportion to the diminution of the power of resistance. This prominence occurs, according to Donders, at the posterior pole of the eye, which takes then an elliptical form in which the culminating point of the ellipse of the sclerotic is found to correspond with the summit of the cornea. The origin and development of posterior staphyloma must be attributed to three principal causes:—To the internal congestion of the eye; to excessive efforts of accommodation; and to the great convergence of the lines of vision, conditions which, in the system favoured by Girola, would all result in increase of intra-ocular pressure. The efforts necessitated by accommodation causing, according to him, augmentation of pressure in the antero-posterior direction, this circumstance would explain why staphyloma is most frequently produced at the posterior pole.

Proceeding then, relative to posterior staphyloma, to the relation of the intra-ocular pressure to the extrinsic muscles of the eye, the learned Italian remarks that the almost spherical form of the eye, and its position in a spherical cavity, render its movements both easy and rapid, without sensibly modifying the intra-ocul

pressure; but, he adds, all this undergoes a radical change, if the form of the eye becomes in any way altered, if it becomes elongated, which is precisely what occurs in cases of posterior staphyloma. Then the eye, revolving in a cavity, changed in form, will encounter a very strong resistance in its movements.

This will give rise to pressures which different circumstances will contribute still further to increase, such as the greater distance between the motor centre and the posterior surface of the eye; the elongation of the antero-posterior axis which increases the distance between the motor centre and the antero-posterior surface of the cornea in such a manner that the lever of the muscular power is augmented by it, and the distance between the motor centre and the points of insertion of the muscles, is increased by it; by this deviation the arc of rotation, which results from a certain shortening of the muscles, will be thenceforward in an inverse ratio. The movements of the lines of vision at the exterior, will be limited, and they must be supplemented by movements of the head.

More serious inconveniences are experienced when the patient wishes to read or to examine small objects. The eye revolves within its orbit, and its equatorial part rests upon the external rectus and is compressed by it. Its form then becomes more elongated in the antero-posterior direction, on account of the lateral flattening occasioned by the internal and external muscles.

These pressures, exercised by the muscles during the movements of convergence, augment the intra-ocular tension especially in the antero-posterior direction. The convergence is rendered still more difficult by the extreme smallness of the angle between the axis of vision, and the line of vision which passes very near the cornea. This direction of the line of vision increases the effort of the external recti when it is required that the eye should converge towards a certain point; in consequence of this, the tension of the external recti becomes greater, and the intra-ocular pressure is also augmented. It is through observation of these facts that the practice of myotomy of the external recti has been introduced in cases of myopia; this, however, is merely a palliative, as Girola rightly remarks, for, by the section of these muscles, their insertion is merely moved backwards, and the pressure exercised by them in movements of convergence is lessened only.

As to the internal recti, the excessive jerky efforts, which are required to induce convergence in cases of myopia, fatigue them to such a degree as to render them unequal to the due performance of their functions, while the intra-ocular pressure is augmented, and the tendency to staphyloma increased.

To diminish the convergence of the axes of vision in myopia, is merely to diminish the distension of the eye-ball, caused by the augmentation of intra-ocular pressure. This is a point of great importance. This convergence is diminished by removing the object perceived to a distance of 10, 12, or 14 inches.

On this account, Girola recommends the short-sighted when reading and writing, to place the book, paper, &c., at a certain distance from the eye, and to have recourse also to the use of concave prismatic glasses, and to refrain from inclining the head, as this position is conducive of congestion of the eye. The author examines in the last part of his work, the connection between intra-ocular pressure and the nervous system.

Following in this the opinion of Donders, he is inclined to admit that in addition to the special nerves of vision and of motion, a third category of ocular nerves may be described; namely, nerves presiding over the secretion of the humours.

As to the augmentation of ocular tension, it appears to him to be the cause of the separation which sometimes occurs between the sheaths of the optic nerve; and also to have the effect when the choroid and sclerotic are in a state of atrophy of diminishing the visual power of the retina by inducing further detachment between the tissue of rods and that of cones. When, on the contrary, the sclerotic preserves its firmness, the retina suffers still more from the effects of the increase of pressure, and luminous subjective phenomena are produced, such as photopsia, chomatopsia, and, if the pressure persist and be augmented, the retina finally loses in a great measure its sensibility.

From the foregoing statements we may conclude that the greater or less power of resistance of the membranes enveloping the eye is a point of the utmost importance, both during the normal action of the organ and in relation to morbid accidents.

During youth, the sclerotic being supple is capable after distension of regaining its original form; but as years pass by, the envelopes lose both their elasticity and their power of dilation. The sclerotic becomes more dense, the choroid, the annulus of Zinn, and the hyaloid membrane become less supple, the crystalline less transparent, and finally this latter contracts. It is to this circumstance that the prevalence in old age of glaucomatous affections may be attributed. If during youth the ocular tissues did not possess greater elasticity, the intra-ocular pressure would produce by means of its variations, and its augmentations, still more serious derangements, and glaucoma would be much more frequent.

Finally, the eye by reason of the changes in form and volume which it undergoes, becomes capable of containing a greater amount of liquid; this increase, however, can only take place within certain limits. Thus, as in the case of the cavity of the pleura, and of others, the accumulated liquids produce, as in the cavity of the eye, displacements and divers pressures; nevertheless, the eye, lying in a cavity with strongly resisting walls, is less capable than these of enduring augmentation of liquids, especially if this augmentation be rapid.

ON SYPHILIS AS IT AFFECTS THE BRAIN AND NERVOUS SYSTEM.

By THOMAS STRETCH-DOWSE, M.D., F.R.C.P. Edin.,

Late Physician-Superintendent to the Central London Sick Asylum, Highgate; Physician to the North London Hospital for Consumption and Diseases of the Chest.

(*Continued from page 523, last volume.*)

TREATMENT.

Of all diseases of the brain and nervous system, I may say that there are not any which yield more readily and rapidly to appropriate treatment, than do those which are due to and have syphilis for their origin.

But in order to make a correct assertion as to the curability or otherwise of our patient, we have first to ascertain not only the precise nature of the syphilitic lesion, and its location, but also the stage of its invasion of the brain and nervous structures. And because we are sure that a paralysis is due to syphilis to say that it will yield to specific measures, is stating that which is not borne out by practice in a very large proportion of cases, but this will, of course, depend upon the means adopted, according to the situation and degree of the disease.

A brain once organically diseased means a mind impaired for ever—its normal state is altered, and it never regains its original condition. This may be easily exemplified, and becomes manifest in an infinite variety of ways, which scarcely come under the cognisance of an ordinary observer. So that in making a correct diagnosis as well as prognosis, we see how extremely important it is carefully to consider all objective signs as well as subjective phenomena.

And here I may say that the physical and metaphysical, the volitional and automatic, are so intimately related, that it is absolutely necessary in making a true diagnosis for us to adopt such means as will prove in what way, and to what extent, this relationship is interfered with.

It must be apparent, even to the novice, that if skill, as far as treatment is concerned, is to materially benefit

our patients, it is in that stage of the disease where the least amount of arterial change has taken place in the structure of a part so complex as that of the brain. Proof is given of this observation on page 146 (Syphilitic Hyperplasia of the Pia mater); had that man continued without treatment for another month, there is no question but that he would have become a hopeless lunatic.

As far as prognosis in cerebral disease is concerned, unless you have great experience, be very careful how you form your opinion—for the most unlooked-for complications may suddenly, and do not uncommonly arise, and totally upset all previous calculations.

The most skilful, and the most successful, physician, is certainly he who fully appreciates when, where, and how, to apply the remedies at his command.

Having made himself sure, as far as possible, that his patient is suffering from syphilitic disease of the brain and nervous system, and having made himself acquainted with the nature of the lesion as to its diffuseness, its stage and localisation; also the age and constitutional condition of the patient, he will, if he is wise, before turning his attention to specific remedies, bring very carefully under notice every faculty and function of the patient's body. I need scarcely refer to the special faculties, for the clinicist who leaves these unnoted must be dreaming.

There is a state of syphilisation, and this refers no less to the brain than it does to the other organs, where mercury especially, and iodide of potassium are as hurtful to the individual as opium would be in the coma of uræmia. I refer now to the syphilitic lardaceous changes. These are not unfrequently found co-existent with gummatous cerebral changes, great depression of the sympathetic and vaso motor centres. The urine will be highly phosphatic, probably passed in large quantities of low specific gravity, containing an excess of urea, slightly alkaline and albuminous, yet the deposit gives no evidence of organic renal disease. There will be functional hepatic derangement, cardiac depression, probably swelling of the lower extremities, hypostatic congestion of the air passages of the lungs, and of the brain itself.

I preface the administration of the bichloride of mercury in these cases by giving, for three or four weeks, the tincture of the perchloride of iron three times a day, and half a drachm of the comp. powder of scammony in the morning, twice a week. Thoroughly nutritious diet in small quantities ought to be repeatedly given, every two or three hours. This is almost the only case where I would advise stimulants to be used, and then cautiously. Brandy will be tolerated in small doses to the extent of four ozs. in the twenty-four hours with the greatest possible advantage.

If the albuminoid changes are of a syphilitic character, we shall soon find a marked improvement. There will be tonicity of the vascular and lymphatic systems—congestions will be relieved—the secretion of urine will be diminished, the albumen will disappear, and a healthy tone will be established. Then iodide of potassium may be given with its usual success. But in these cases, my practice is to give the bichloride of mercury with bark for a few weeks, and subsequently the iodide of potassium.

This treatment of elimination and building up where we have associated blood changes, as in albumenoid syphilis, where the patients present the symptoms and signs just described, will prove of the utmost value.

In reference to the advantage to be gained by the administration of alcohol in syphilitic softening of either brain or cord, I would quote the case of one of my hospital patients, a young fellow of 30 years of age, who suffered from softening and degeneration of the spinal cord. There was a clear history of syphilis, and it was supposed from his own account that the disease commenced as a syphilitic meningo-myelitis. Albumenoid visceral and cutaneous changes were evident.

When I first saw him he was utterly helpless, somnolent, and confused in intellect. I prescribed for him strychnine and bark, and 8 ozs. of brandy in the 24 hours. In a few weeks he had improved most markedly. At the end of three months the intellect became clear, he had perfect use of the upper limbs, and increased power in the lower. I then ordered him iodide of potassium with ammonio, citrate of iron and strychnine, and reduced the brandy to 6 ozs. in the 24 hours. He continued to improve, but in a few weeks after this he passed from my care—the stimulants were suddenly discontinued, and he died in three days.

This case made a very strong impression on my mind, because it proved that in the low and advanced forms of degenerative changes of the spinal cord and brain, associated with the blood changes of syphilis, alcohol under certain circumstances must still remain the backbone of our treatment. When softening of nerve substance has set in, if nutrition and vascular tonicity is not supported in every possible way, death results from nerve and vascular depression, cardiac syncope, and collapse.

I maintain that it is utterly useless to endeavour to be empirical in the treatment of diseased states. Yet there are many of the syphilographic school, who would have us believe that in syphilis, no matter so long as it is syphilis, mercury or iodide of potassium is at once demanded. I must say that my own practice does not bear out this conclusion; but if there is one thing in therapeutics, of which I am more certain than any other—it is that mercury is the antidote to syphilis, but the term syphilis as bearing upon diseased states, has a much wider significance than it had some few years since. There are physicians who are rash enough to replace syphilisation by mercuralisation, and who check the tendency to ptyalism and salivation by astringent washes. I cannot agree with the mode of procedure; still, a slight soreness of the gums is no indication that the patient's system is intolerant of mercury, and that it ought not to be given. I do not withdraw mercury at once under these circumstances, although I may alter the preparation. It will be found that patients will take that inestimable, but now almost discarded pill of Plummer's, when other forms of mercury cannot be borne, or the combination of grey powder with quinine will answer well when the iodide of mercury is not tolerated.

I have never found any special advantages from injections, inunctions, or mercurial baths. (My remarks apply to syphilis as it affects the brain and nervous system).

In several cases where gummatous inflammation of the membranes of the brain has been known to exist, I have with my hospital patients adopted a mercurial course by inunction, when they have been surrounded by the most favourable hygienic conditions, and all means have been adopted, which are generally considered beneficial to this course yet I cannot say that I have noticed any special advantages to arise from it. To this, however, I must offer one exception—namely, in the hereditary syphilis of children, where I have found mercurial inunction and iodide of potassium baths to answer most admirably.

After considerable experience, and much attention given to this subject, I am inclined to give the preference to the old-fashioned blue-pill, either alone or in combination with quinine or opium; or a suppository of grey powder, and the butter of the cocoa-nut passed well into the rectum night and morning. These preparations rarely do harm, are nearly always tolerated, and seldom produce serious constitutional disturbance.

If there is a tendency to ptyalism, the mouth from the first must be kept clean, and washed out well five or six times a day with a solution of chlorate of potash and tannin, or what answers better in some cases, is tannin with biborate of soda. If the submaxillary glands become tender, or there is a feeling of stiffness about the jaws, or increased salivation—then mercury must be at once discontinued for a time. If absolutely necessary that it should be gone on with, quinine, generous diet, and fresh air, will often put the patient into a condition to tolerate

mercury, when under other circumstances rapid ptyalism ensues.

We appear at the present time to have arrived at a period in the history of the treatment of syphilis when it has been conveniently settled that mercury plays its part in the primary stage of this disease, and iodide of potassium in the later stages; but those who have had extended experience must be aware how fallacious this line of argument is. Of course, no one ever thinks of giving iodide of potassium to cure a syphilitic roseola, and, according to the foregoing school, no one would think of giving mercury to cure rupia, but this doctrine is utterly erroneous. I maintain that there are certain manifestations of disease in association with mal-assimilation, which we are pleased to call syphilitic, where iodide of potassium and a mercurial course, as before mentioned, are fraught with mischievous consequences, and I refer now more particularly to the iodide of potassium—the therapeutic magician which is to conquer syphilis in any of its stages.

Well, I must admit—and I regret having to do so—that this charmed drug has not possessed in my hands that illimitable potency which many have ascribed to it. I have used it in small and in excessive doses, over a wide area, and for varying periods of time, and have noted its effect in both functional and organic disease, with considerable care, and it has been only in the minority of cases where I have traced good results to its immediate specific action.

We know that some patients are more intolerant of this drug than others are of mercury, but the same constitutional state of rebellion is not usually associated. Those who cannot take iodide of potassium can take mercury with impunity, and *vice versâ*.

In order that iodide of potassium may be well tolerated, and productive of benefit, the tongue must be clean, the appetite good, and the nutritive and assimilative processes in fair working order. If this is not the case means must be taken to render them so by functional remedial agents. I have often used the iodide of potassium bath with benefit where I have known the drug was required, and could not be taken by the mouth. The bath was prepared by dissolving half-an-ounce of the bicarbonate of soda in three gallons of hot water, into which the patient was placed, the skin having been previously thoroughly cleansed with a hot bath of soap and water. After the patients had been in the bath of soda for two minutes, a two-drachm solution of the iodide of potassium was added, and in this they remained for about ten minutes; when they came out the body was gradually cooled down, and a cold douche administered. I have never seen iodism produced by this mode. In other cases I have adopted an analogous but different course. The patients have had their skins thoroughly cleansed with soap and water, and a pill of five grains of the extract of jaborandi is given. They are then wrapped in a blanket, which had been wrung out of a hot solution of soda and iodide of potassium (a blanket bath is thus administered) in which they are kept for periods varying from thirty minutes to one, two, three, four, or even six hours.

In painful neurotic affections of the peripheral nerves chloral may be added with great advantage to the solution of the iodide of potassium.

I cannot here particularise as to those cases requiring any special set form of specific treatment, but certain enough it is that by practice one gets to know that the mode of application of a remedy is often of relative importance with the remedy itself. I think we may, perhaps, the more readily look upon this as a biological law of great magnitude, but which is somewhat beyond our ken, and compare it with that well-known chemical law of Isomerism, where we find an identity of elements and of atomic proportion, with a difference in the amount combined in the compound molecule, and of its essential properties.

Beyond the mere specific treatment of syphilitic disease of the brain and nervous system, we must not lose sight of secondary conditions which are common, however, to diseases of the nervous system in general, and the hæmorrhages, thromboses, and softening which result, do in a more or less degree, require the same preventive measures and remedial agencies. We know that a syphilitic growth of the dura mater, and more particularly of the pia mater, and of the brain substance, is always associated with vascular hyperæmia. I am not now referring to the stage of thrombosis which is that next allied to incipient softening, and which does not require a depletive course, as we shall see, but I rather refer to a congestive stage, both of the brain and cord; and if we pay attention to the signs and symptoms previously laid down under the head of diagnosis, our task will not be so difficult as it may at first sight appear.

In the stage of congestion it is important that local bleeding, either by the application of leeches, or the cupping glass, should never be forgotten, provided of course that the symptoms of increased heat and cerebral blood pressure are considerably increased beyond the normal.

The stereotyped phrase, "shave the head and apply ice," should be remembered, but I prefer an evaporating, rather strong spirit lotion to ice for physiological reasons. Local blood-letting over the seat of lesion, the complete removal of the hair, and evaporating lotions constantly applied, is the best and immediate treatment for congestions. Should the lesion be at the base, then cupping at the back of the neck, or the application of leeches to the mastoid part of the temporal bone, should be resorted to. The head and shoulders should be raised, but avoid putting the body into a constrained posture. There must, as far as possible, be perfect rest of mind and body. Quiet, and the absence of strong light and sound, should be enjoined, no matter whether there is apparent intolerance or not. The lower extremities should be kept warm, and mustard pediluvia used once in the twenty-four hours. All stimulants must be avoided, but do not fail to feed your patient often. Solid meat diet, with bread and milk, may be given, for here, be it remembered, we have not the functional pneumogastric depression to contend with, which we have in hæmorrhages, thrombosis, and general cerebral hyperæmia, and stimulating the gastric vessels by an assimilable food, acts as a derivate to a local cerebral congestion rather than otherwise.

Pay particular attention to correcting an arrest of function, hepatic, renal or alvine, upon recognised principles and do not be led away by the fallacious doctrine that a clean tongue indicates a cerebral lesion, whilst a furred tongue is due to chylo-poietic derangements. Promote sleep by the use of chloral in one full dose, and equalise the action of the heart by the use of tinct. of digitalis, and of the vaso motor system of nerves by ergot, aconite, and bromide of potassium.

If epileptiform seizures arise, with a tendency to excitement or delirium, then a full dose of calomel should be given, or croton oil, to act upon the bowels. The bladder must be well looked after, and the iodide of potassium must be given every four or six hours in full doses. But in those cases where the disease has advanced a stage or two beyond this, where we have thromboses, small hæmorrhages, and softening, with fits of somnolency, and objective signs of paralysis, we find a different constitutional state, and a train of morbid phenomena varying very much from that which has just been under our consideration, and I cannot see in what way the local abstraction of blood would be advantageous. At all events, this is not my mode of procedure, and I should look upon the continuous application of the ice bag as pretty certain death to the patient. We shall have cerebral depression with all its signs and symptoms to combat. The action of the pneumogastric nerve will be arrested; there may be vomiting, irregular action of the heart and of the lungs, and more or less cyanosis from this cause. There may also be attendant convulsive seizures. The skin may be dry, and of normal temperature, or on the other hand, it may be cold, clammy, and

moist; the lower extremities will be cold. The course of treatment here is obvious enough, and to a certain extent will be the reverse of that applicable to the condition we have been considering. Where peripheral nervous and vascular excitation is indicated, mustard plaster may be applied to the nape of the neck, the epigastrium, or the calves of the leg. The stomach can digest nothing, so leave it alone. Stimulants must be given cautiously, and the limit of their administration must be regulated entirely by the patient's state. The organic system of nerves must be kept in action until the wave of cerebral depression has been tided over. When this occurs, and reaction has commenced, perhaps a little more activity on the part of the medical attendant may be necessary, but do not interfere too hastily; guide, and be guided by, Nature's processes if possible.

In several cases of this kind I have averted the tendency to death by the application of the continuous current to the calves of the legs when the patient could not swallow. Cerebral depression has been by this means relieved, the legs have been moved voluntarily, nourishment has been swallowed, and the patient's life saved. The following case is an example of the benefit to be derived from this treatment.

CASE XX.—*Syphilitic Softening of Right Anterior and Posterior Central Convolutions, the adjacent Convolutions being more or less involved.—Left Hemiplegia, Cerebral Excitation, and arrest of Death by the Galvanic Current.*

Mary A——, was admitted into hospital under my care on the 3rd of February, 1876. She contracted syphilis at the age of 27, and has suffered severely from its effects, but beyond this no clear history was obtainable. She stated that two years before I saw her she had severe pain in the head, and a series of epileptic injuries, and she gradually lost some use of the left side.

Shortly after her admission, on Feb. 16th, at 11 a.m., she was seized rather suddenly in the middle of the day with clonic convulsions of the left half of the body including the face; the eyes drawn to the *left*, with *right* opisthotonos, no marked loss of consciousness, complete loss of voluntary power and sensation of the *left* side. Both motion and sensation of the *right* side were impaired (sympathetic impairment). 3.30 p.m., was quite unconscious, the convulsions of the *left* side more marked and persistent. At 6 p.m., in the same state; she could not be roused, neither could reflex movements be induced; the eyelids were well raised and the pupils dilated. Resp. 14, shallow and sighing; pulse 166. No muscular rigidity or clonic contraction of limbs.

17th.—Quite unconscious, clonic spasms of left side, hiccough. There is neither sensibility or voluntary power of movement in any part of the body; there is hyper-reflex excitability of the right cerebral motor area. For instance, when the left side of the face is tickled, clonic convulsive movements are excited, not of the left half of the face alone, but of the entire half of the body; the pupils are now minutely contracted. Pulse 170, Resp. 30. An hour after this I found her in a dying state, coma was profound, and breathing stertorous. After putting the various points of clinical evidence together, I came to the conclusion that she was dying from cerebral depression (rather than compression) due to cortical hæmorrhages, and I resolved to stimulate the brain through the peripheral nerves by the galvanic current, as I had previously done with some success in other cases. The following shows the reaction. Stohrer's continuous current was used.

Facial muscles respond equally well on both sides to 10 cells:—

Upper extremities. { to 20 cells in 20 sec. / to 28 cells in 25 sec.

Lower extremities. { to 20 cells instantly. / to 30 cells instantly.

Immediately after the galvanisation she was aroused to seeming consciousness, performed *quasi* voluntary movements, and swallowed nourishment.

It is of great, one might well say of vital, interest to recall to our mind the fact that before the galvanisation her cerebro-spinal system was inanimate. Now we find the following to be the condition:—

Before the Galvanisation.	*After the Galvanisation.*
Pupils contracted.	Pupils widely dilated.
Profound coma.	Volitional consciousness.
Stertorous breathing.	Breathing not stertorous.
Pulse 170, small and fluttering.	Pulse 120, fairly good volume.
No reflex action.	Reflex action of *right* foot only.
Sensation completely in abeyance to pricking and pinching.	Sensation completely in abeyance to pricking and pinching.

Brandy and milk was administered. The urine was drawn off to 37 oz., and one drop of croton oil was given.

6.40 p.m.—Is conscious; knows everyone, and swallows freely, but has no voluntary power of the extremities, save of the right arm. The brain, however, is not sufficiently active to receive impressions, to generate ideas, and to produce co-ordinate movements—for instance, when asked to close her eyes or protrude the tongue, there is no response.

18th.—Has passed a quiet night, and taken nourishment—the special senses of sight and hearing are now in good working order. There is voluntary and co-ordinate movement with the *right* limbs, and partially so of the left. There is now, relatively, greater loss of motor power than of sensation on the *left* side.

19th.—Quite conscious and reasonable. 1st. Nerve normal. 2nd. Says her sight is better than before the attack—both discs hazy, veins look large. 3rd and 4th. Normal. 5th. Anæsthesia of *left* half of face. 7th. Palsy of *right* facial muscles. 8th. No taste on the left half of the tongue. Respiration and pulse normal.

Temperature not taken. After this she got about, as she had done previous to the attack—a left hemiplegia only remaining.

About five months after this, on July 29th, she was seized with clonic convulsions of the *left* half of the body. Coma and stertorous breathing supervened, and she died. Galvanisation was not, on this occasion, resorted to.

The *post-mortem* examination was made with care, and the following notes have been extracted:—There was hypostatic congestion at the base of the right lung only. The heart and valves were healthy. The aorta was not atheromatus. The liver was hardened and patches of cicatricial thickening were found over the surface of the right lobe. The secreting structure of the kidneys was healthy, but the calyces were enormously dilated, the bladder hypertrophied.

Upon removing the dura mater, which had not adhered to the skull, it was found to be connected with the arachnoid and pia mater, and the substance of the central convolutions of the parietal lobe of the right hemisphere. It was much thickened, of a yellowish colour, and in connection with it the brain substance was softened, and also of a yellow colour.

Upon slicing off the hemispheres, the substance of the central ovale was seen to be remarkably pale, and nothing more was noted until the central ganglia were exposed. Then it was found that the right optic thalamus and corpus striatum had undergone atrophy; the former much more so than the latter. Yet upon section, there was no appearance to the naked eye of old standing or recent hæmorrhages, but a slight softening existed. The right crus was similarly affected. The *left* side of the brain was healthy. The arteries were uniformly thickened, not atheromatous. They were not examined microscopically. The pathology of this case is interesting enough, but it is only from a therapeutic point of view that I have here brought it forward. In looking it over from the beginning to the end, one is convinced, so far as one can be, that had not galvanism been applied, this woman must

have died from cerebral depression and cardiac and pulmonary asthenia.

For my own part, judging from past experience, I am greatly inclined to advocate the employment of the galvanic current in any case where we have a comatose condition with impending death, provided we are not sure of the existence of extensive hæmorrhage; and I have little doubt there are many persons who die comatose simply from cerebral depression inhibiting the automatic, cardiac, and pulmonary plexuses, and so inducing a condition of asthenia incompatible with vitality.

We have now to consider a few other points in connection with treatment.

We have seen that iodide of potassium and mercury are almost, but not entirely, essential to break down and promote the resolution of syphilitic inflammatory products. There are, however, some further conditions which we must not lose sight of. Hygienic measures in reference to mind and body are of the utmost importance, and anything which weakens the general tone must be at once altered. The mind must be relieved from all anxiety at any cost—over study and close application to business is sure to be followed by serious consequences if persisted in. All tendency to fatigue must be shunned. The passion for sexual intercourse must not be indulged. Regular hours for eating, drinking, sleeping, &c., are as necessary, as a plain, wholesome, and generous diet. The various functions ought not to be neglected. The morning cold baths and the Turkish bath should be used, but with extreme caution.

The circulation should not be interfered with by any undue excitement or depression, and the least headache should be regarded with suspicion, and receive immediate attention. Smoking should be strictly prohibited, unless under very exceptional circumstances.

With regard to the administration of alcohol, it would be impossible to lay down any absolute rule, because we must be guided by our patient's constitutional condition. There are some states of progressive softening of the brain and spinal cord similar to the one which I have noted where alcohol is indispensable to maintain digestive functional power and body heat, but in the more common class of nervous disease which may be called functional, and which is due most probably to vaso motor disturbance, every form of alcohol ought to be given up.

There are, however, even here some few exceptions, and where such exist if stimulant must be resorted to I know of no more wholesome wine than that of St. Raphael; it is rich in tannin and astringent principles, and contains a fair and constant percentage of alcohol. From four to six ounces may be taken with food during the day without exercising anything more than a tonic influence upon the nervous system.

It is of great advantage to keep the feet warm, cork soles and thick boots should always be worn. The bowels should be kept open with a dose of Friedrichshall or Hunyadi János water in the morning. Gentle horse and carriage exercise will be serviceable to engender sufficient bouyancy of the animal spirits to promote normal functional activity. Change of air and scene may be necessary, but if it can be avoided let the patient be kept from Continental hotel life.

In the neuralgias of the fifth nerve apply hot solution of the hydrate of chloral (see paper by author "On the Outward Application of Chloral for the Relief of Pain," *Med. Examiner.*)

The hypodermic injection of morphia is especially valuable for the dull wearying aching pains and muscular cramps of the extremities associated with advancing sclerosis. Friction is of value in muscular atony, and the galvanic current may be used.

The value also of strychnine under such circumstances must not be forgotten, but the chief point of all others in treatment is to make oneself as sure as possible of the exact conditions which are present. If this is not done treatment will be worse than useless, it will be hurtful.

(To be continued.)

Clinical Records.

ST. MARY'S HOSPITAL.

Acute Tonsillitis treated with Belladonna.

Under the care of Dr. HANDFIELD JONES.

(For the notes of these cases we are indebted to Mr. Rayley Owen.)

L. G., æt. 29, a servant, was admitted August 24th, 1870, with great swelling and inflammation of right tonsil and palate, and a very weak pulse of 108. She had been ill five days, and had been treated with emetics and gargles. An incision was made in the tonsil, and tr. belladon. ℥. xv., + quin. disulph. gr. j., in a tablespoonful of water was ordered every three hours. She progressed most favourably till the 29th, when the belladonna was left off, a mixture of quinine and iron being substituted. Two days after, however, she was much worse, and the tonsil became very much inflamed, she was immediately ordered twenty drops of tr. belladonna every three hours. On Sept. 3rd, she was much better again, and able to swallow. Temp. 101·8, pulse 120. No toxic effects of belladonna. On Sept. 5th, the temperature was normal, the pulse 93, and all inflammation had disappeared from the throat. Quinine was again ordered in place of the belladonna, and on the 7th the temperature had risen again to 100·4, the pulse was 136. The throat, however, was not again affected, and she was discharged convalescent in a very few days.

The next case is that of C. E., æt. 17, admitted December 1st, 1871. She had been out of sorts for a month, and three days before admission her throat became sore. Her temperature was found to be 101, pulse 104. Both tonsils were seen to be much swollen, almost touching one another, causing great difficulty in swallowing. A mercurial purge and twenty drops of tr. belladonna in a tablespoonful of water to be taken every two hours were ordered. After four doses she became delirious, her face flushed, and she had much headache. The belladonna was immediately left off. On the next day (2nd) she was quite rational, and much better, her throat being not nearly so red or swollen. Temp. 99·4, pulse 81. She was ordered five drops of the tr. every four hours. On the 3rd her throat was much improved, but rather dry, tonsils not nearly so large. Temp. 99·6, pulse 84. On the 6th she was put on a tonic, and on 14th she was discharged cured.

In the next case the good effects of the belladonna are even more strongly marked. It is that of M. P., æt. 30, admitted July 16th, 1877. She had been ill three days with severe quinsy, her tonsils and uvula were much swollen and inflamed, so much so that she could not open her mouth sufficiently for a good examination. Temp. 101·6, pulse 104. She was put on tr. belladon. ℥ x., + mag. sulph. gr. x., + aquæ ℥ss. every hour. On the next day she was much better, temp. 99·4, pulse 90. The medicine was now ordered every two hours. On 19th, temp. was 98·4, pulse 70, mucous membrane slightly red. On 21st she was quite well, and was ordered a tonic, and was discharged cured in two or three days time.

The fourth and last case is that of E. S., æt. 14, in service, admitted August 23rd, 1877. Has always been subject to sore throat, with inability to swallow, and much headache. On admission tonsils were both inflamed and swollen, touching one another. Temp. 100·6, pulse 104, speech thick and indistinct. Tr. belladon. ℥ x., + mag. sulph. gr. x., + aquæ ℥ss. was ordered to be taken every hour. In the evening the temp. had risen to 102·6, pulse was 100, and she was very nervous and excited. On the next day, however, the temp. had fallen to 99·8, the pulse to 80, and she was much better, tonsils less, speech distinct. She showed no ill effects from the belladonna, but it was ordered to be given every two hours.

25th.—Temp. was 99·7, pulse 68. Swallows much better. Rep. mixt. 4tis horis.

26th.—Temp. normal, quite free from pain, no difficulty in swallowing. Pulse 70.

27th.—Quite convalescent, and a tonic was substituted.

Remarks.—In the above cases it will be seen that the belladonna decreased the quickness of the pulse, although "the first effect of belladonna is supposed to increase its quickness, fulness, and force to the extent even of fifty to sixty beats in the minute" (Ringer). Dr. Harley, however, is of the opposite opinion, and his theory seems borne out in these cases. Dr. Nunneley also says that in the frog belladonna does not increase the frequency of the heart's action. In the first case the action of belladonna was well marked, for immediately it was left off for the first time all the bad symptoms returned. When it was omitted finally the pulse immediately rose from 93 to 136. The temperature in all these cases seems to have been influenced by belladonna, although it is not generally supposed that the drug has any action on the heat of the body.

THE PERILS OF MINING.

A PARLIAMENTARY discussion on the appalling frequency of disasters in mines, and grievous perils to life and limb of those who labour for our profit and comfort, revealed for the thousandth time, that by far the greater number of these so-called accidents in mines are preventible, if only those who are largely interested in them could be induced or compelled to take proper precautions. It is an idle waste of time to talk of appealing to science to help mine owners to devise tests by means of which the presence of dangerous gases shall be made visible to the eye of the miner as smoke or steam is visible. The honourable member who made the suggestion, knows well that the inventions and suggestions of scientific men are shamefully ignored. Mr. Macdonald was quite justified in his statement that mine owners should really be held responsible to the country for the greater part of the iniquitous loss of life annually occurring, since they have failed to adopt precautions, provided for in the Mines Act of 1852, and which undoubtedly would, if efficiently carried out, meet most of the necessities of the case. No one would suggest for a moment that mine owners are indifferent to the loss of human life; but coroner's inquests plainly show that of the 10 or 12 hundred lives yearly sacrificed in mines, the greater part are so lost through the lack of a proper system of inspection; the want of special rules for the management of mines, and the adoption of scientific means freely placed at the disposal of owners. With a proper amount of inspection, danger from the use of naked lights could scarcely take place. No doubt a gross amount of ignorance exists amongst miners, and this is a frequent cause of wanton recklessness; but probably this same ignorance makes them fearless of dangers which surround them, and which, if they were more fully alive to, would probably have the effect of keeping them altogether out of mines. The miner simply knows when he goes to his work in the morning, that if it is wet and cloudy, he will incur more danger than usual, and he enters the mine with a heavy heart, probably finds the accumulated gas too much for him, and when he lights his lamp, it is soon put out by a great accumulation of gas in the mine. For more information, he looks to the "viewer" or manager. The repugnance of most of the men to the use of scientific appliances is tolerably well known, it is even greater on the part of owners. "If," said a miner, to whom we were explaining a scientific invention, "masters had to buy men as they do horses, your fire damp indicator would soon be brought into use in every mine in the kingdom." This is too true. It is well known that the zones of greatest danger in mines are between 500 and 12,000 feet in depth; those above or even below this are much less dangerous than those within it. Nevertheless, blasting is just as recklessly and indescriminately permitted at all depths, without thought or care for the consequences. In some of the Cornish mines, the air is often so poisonously loaded with carbonic acid gas, that the miners' lights flicker for a while, and then suddenly go out. Miners at work in such workings, are only able to remain for ten or fifteen minutes at a time, or until they fall exhausted, and are obliged to be assisted out by their companions. The "viewer" depends upon his own rough and ready way of ascertaining when there is a dangerous quantity of "fire damp" in the mine or working, and will not try any new method. Some fourteen or fifteen years ago, a chemist and a man of science, Mr. G. F. Ansell, invented an extremely valuable and useful instrument, by means of which the nature and quantity of the gas in mines can be measured to the greatest nicety. An invaluable indicator was placed in the hands of mine owners, which, had it been adopted, would have been the means of saving thousands of useful lives. The action of the instrument is simplicity itself; for having been constructed on the beautiful law of diffusion, when placed in an atmosphere containing fire-damp, the hand of the "Indicator," which in appearance is like an aneroid barometer, travels over the face of the dial because of the diffusion of the light carburetted hydrogen into the chamber, causing an increased volume, and thus indicating the amount per cent. of explosive gas present. The inventor, indeed, furnished three kinds of instruments, one consisting of what he terms a diffusometer, an electric alarum, and a small galvanic battery, the whole being made sufficiently portable for the miner to carry with him into the "headings;" upon a sudden irruption of gas, the alarum-bell rings, and continues to do as so long as there is danger. The second form of instrument is for indicating gradual accumulations of gas, and by the addition of an electric telegraph wire it will indicate at the mouth of the pit, or in the manager's office, where the gas in any particular part of the mine is explosive. The third arrangement is for indicating and measuring the presence and quantity of fire-damp; it is so extremely portable, being about the size of an ordinary workman's watch, that it can be carried about in the waistcoat pocket. The instrument is graduated as in the ordinary aneroid barometer. The indications are unvarying, 100 per cent of fire-damp being indicated by 1.680 inches of the barometrical scale, and 10 per cent. by 0.130 inches. It quite as readily determines the amount of carbonic acid or choke-damp, the hand of course moving in an opposite direction to that of fire-damp.

This extremely ingenious invention has not yet found favour in the eyes of mine-owners, and is not adopted possibly from the repugnance owners and managers feel to scientific appliances, and probably nothing will induce them to listen to men of science until by Act of Parliament they are compelled to compensate the widows and provide for the orphans of those whose lives are sacrificed in their service.

Special Correspondence.

[FROM OUR SPECIAL CORRESPONDENT].

Paris, Rue de Luxembourg,
June 28th, 1878.

RESUMING my history of the development of the French military surgeon, whom I left under the title of *medicin stagiaire*, I shall briefly dwell on the instruction and training at *l'Ecole d'Application de Medicine et de Pharmacie Militaires.*

The *personnel* of this school embraces an inspector *au service du Santé*, and fourteen professors. The object is, to initiate the students in the special branches of their art in reference to service in the field, army regulations, laws, decrees. The teaching extends over a wide range of subjects, familiar to all Netley cadets, as clinical medicine and surgery, military hygiene and legal medicine, army epidemics and diseases, regional anatomy, operations, the use of surgical appliances, chemistry applied to hygiene, &c., &c.

The instruction is made as practical as possible, and progress is tested by periodical examinations, when if satisfactory, the cadet emerges from the school with the title of *aide-major* of the second class, the lowest grade in the service.

The medical hierarchy is distinct. It does not bear any relation to the grades of the combatant officers; in other words, there is no such thing as relative rank, which has proved such a source of discord in the English Medical Service. The French army in the time of peace is supplied with medical officers in the following number :—

Seven medicins inspectors; 40 medicins principaux, first class; 40 medicins principaux, second class; 130 medicins majors, first class; 260 medicins majors, second class; 400 medicins aide-majors, first class; 400 medicins aide-majors, second class.

When the normal cadre is insufficient, auxiliary medical officers are appointed by the Minister of War, from the Civil List. The State thus recognises the necessity of providing for the wants of its soldiers, and civil practitioners form a useful and necessary adjunct to the army medical department. To be, however, successful, they should only supplement and not supplant the existing military service, and by being made directly responsible, through the chiefs of the war department, the auxiliary surgeons are held under control, and perfect discipline is thus secured. In large towns well managed hospitals may be engaged, officered by surgeons of talent and experience. There can be no doubt the patients gain by this arrangement. The discipline of the French service is strict, the medical officer being under the authority of the military officers, as the general of the district, commandant, colonel, lieut.-colonel, or the officer temporarily in command, whilst medical duties at hospitals are strictly enforced; there is supervision to secure regularity of visits, dressing of wounds, and good order. The hospital system of the French army has from time to time undergone frequent changes. Sully established the first ambulant hospital at the Siege of Amiens in 1597, under Henry IV. Pigneroll, the first stationary hospital, under Louis XIII., 1630. In 1788, the general military hospitals were suppressed, and not re-established until 1792, since which date the regimental infirmary occupied an altogether secondary place.

A complete change has been inaugurated in the hospital system of the French army by a recent law of the French Assembly, dated July 7th, 1877. Each *corps d'armée* in the provinces will retain in the chief towns a military hospital, with an establishment destined for the special instruction of the *personnel*, and the preparation and maintenance of the necessary material of the hospital service of a corps d'armée, in case of its being mobilised. Except in their head-quarter corps hospitals, the permanent military hospitals of Paris and Lyons, and the hot baths, the sick of the army are treated in the special wards in the civil hospitals in charge of military surgeons, when the effective of a garrison numbers 1,000 men, should the military *personnel* permit.

In case of insufficiency in this respect, the military wards are in charge of civil surgeons. In the French army the medical officers are divided into two sections, the one attached to regiments, the other to stationary hospitals. The latter only are affected by this decree. The pay of the French surgeon is small, so that, pecuniarily, the English surgeon has the advantage, whilst at the same time his position is more defined, his duties are lighter, and discipline is not so severe. You must regard this as a prelude to a description of the appliances and surgical instruments to which I shall devote my next letter.

L'Affaire Danval has been an engrossing topic of conversation in professional circles, and Dr. Bergeron's conduct has been severely criticised by the French press. What is the duty of an expert? It has been defined by our jurisprudists, but unfortunately some witnesses are incapable of resisting the temptation of combining the advocate with their pure duties; hence such verdicts as the one pronounced on Danval. Chantrelle was hung, Danval sentenced to penal servitude. In both cases the medical evidence was unsatisfactory. I have no doubt this subject will be well-ventilated at the International Congress on Legal Medicine, which is announced for August 10th, 11th, and 12th, at the Palais de Justice. I trust England will send some worthy representatives.

I would refer your readers interested in social questions to a very interesting paper by M. D'Haussonville in the June number of the *Revue de Deux Mondes*, on the vagabond and mendicant youth of Paris. The Paris *gamin* is notorious. As we are told, the child is father to the man, we must not wonder at some of the excesses of a Parisian mob, when we learn that there are 20,000 boys between the age of six and fourteen who do not attend school or receive instruction of any kind, and whose lives are devoted to vagabondage, mendicancy, &c., &c. What number of these may be illegitimate it is difficult to say. M. D'Haussonville informs us that the number of illegitimate births in 1877 were 14,612, so there is one illegitimate to every 2·78 legitimate, a decrease on former years; there is plenty of work for the *crèches* and for philanthropists.

At a recent meeting of the French Academy, M. Cornu, Professor at the Polytechnic School, was elected a member in the section of physics, in the room of the late M. Becquerel. The other candidates were MM. Mascart, Le Roux, and Quet. I must defer until my next letter other interesting matter, as I have some pleasure engagements on hand, and go from labour to refreshment.

P.S.—I may as well state for the benefit of any of my *confrères* who purpose visiting the world's fair, and have no experience of the different routes, that the most enjoyable one in summer time is that via Newhaven and Dieppe, by the London Brighton and South Coast Railway. Having been to and fro about a score times, I have no hesitation in giving this advice. It is the most enjoyable, firstly, because it costs a little more than half the South Eastern and Chatham and Dover routes from London; secondly, the company has recently put on some fast commodious steamers, which are nearly double the size of "the tubs" of the short sea route; and thirdly, because the country traversed through Normandy is very charming, so unlike the dreary desert-like journey from Calais to Paris.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 3, 1878.

THE MEDICAL REFORM BILL.

THE Duke of Richmond's Bill and the less pretentious measures which are before the House of Commons, and intended to deal with medical reform, engross, as may be easily conceived, the almost undivided attention of the profession. We may, with advantage, recall the purport of these bills to the mind of our readers by a brief *resumé*:—

a. The Government Bill introduced by the Duke of Richmond in the House of Lords, passed through that House, and now standing for a second reading in the House of Commons. Amended at its last stage in the Lords, upon the motion of the Marquis of Ripon, so as to

provide that no diploma or degree shall be essential for registration.

b. Mr. Arthur Mills and Mr. Childers' Bill. The Bill of the British Medical Association, providing for registration upon diplomas granted after Conjoint examination. Its principal object is the direct representation of the profession by election of six members to the General Medical Council.

c. Dr. Lush's Bill—that of the Alliance Medical Defence Association—to give increased powers for the prosecution of counter-prescribers, and other quacks.

d. Mr. Errington's Bill, suggested by Sir Dominic Corrigan, to compel all persons who would hold a public appointment of any sort to pass a central State examination.

Each of these measures has been postponed from day to day to await the consideration of the whole question upon the second reading of the Government Bill, which will probably be taken within the next fortnight.

That Bill is met by three distinct propositions: Firstly, Mr. Meldon and Mr. Sergeant Simon have given notice to move its rejection, but this proposal may probably be intended to secure for the question a full discussion, inasmuch as no Bill so opposed can be debated after midnight, and it is usual to take this method of securing it attention during the early part of the evening. Secondly, It will be moved by Mr. Errington and Dr. Lush that the whole subject shall be referred to a Select Committee, with a view to legislation next year. This course is doubtless suggested by the hon. gentlemen in order to obtain for their own measures a full discussion, but it is also warmly favoured by the Scotch bodies, and by the British Medical Association, but for totally different reasons. The Scotch bodies approve of it as the only means which presents itself of putting off medical reform of any sort, and because they hope that a Select Committee will put off the much-dreaded Conjoint Examination, at least, for a few years. The British Medical Association approves of the proposal because it wants a more radical reform, and thinks that a Select Committee will be the best means of attacking the corporations and the General Medical Council, and will afford the best hope of obtaining direct representation. Thirdly, the English Conjoint bodies and the Irish College of Surgeons are anxiously desirous to pass the Bill in such amended form that the continued efficiency of the licensing bodies would be ensured.

By Lord Ripon's amendment the Bill provided that the certificate of a Conjoint Board should be registrable as a full qualification to practice without any degree or diploma whatever. This suggestion was intended to meet the views of the lady doctors, who—not being admitted to the corporations—naturally objected to pay for a corporate diploma.

It has been agreed by the English and Irish bodies to meet the difficulty thus arising by the addition of the following rider to the clause :—

"Provided that if the scheme of any joint board requires that any persons passing the examinations of the board shall become affiliated to any medical corporation or corporations concerned in the scheme, it shall be the duty of such corporation or corporations to affiliate, as the scheme requires, each such person on his application, and a person so required to be affiliated shall not be registered as a licentiate under the above enactment till he shall have been affiliated by the corporation or corporations."

This rider is in the hands of the Government, and, should it be adopted, it will be in the power of the conjoint bodies of any division of the kingdom to agree together to make a diploma necessary for registration—but if they do so they must be prepared to admit all comers—male or female—who have passed the conjoint examination to *all* the privileges attaching to their diploma.

Lastly, Mr. Mitchell Henry has given notice that he will move—

"That no measure of medical reform can be satisfactory which does not provide for the application of all licensed practitioners to one or other of the existing medical corporations either in England, Ireland, or Scotland, and further, that provision should also be made for the direct representation of the profession in the Medical Council."

It will thus be seen that there is a very great contest of opinion on the question, and in the crisis the General Medical Council has met to consider it. A proposition adverse to conjoint examination and to the Bill was submitted by Sir Dominic Corrigan, and, as might be expected, vigorously supported by the Scotch representatives, who devoted themselves to a eulogy of the existing system which, by their account, neither needed nor was capable of improvement. The motion was, we are glad to say, rejected by a majority of 16 to 7, and the principle of the Bill thereby endorsed. Upon the two chief aspects of the subject there is, amongst the profession and the public, an overwhelming concurrence of opinion. Everyone, save those who profit by the diploma trade, feels that reform is urgently needed, and that conjoint examination is the only method of reform which is practicable under existing circumstances. Everyone, save a very few ultra radicals, is of opinion that the licensing corporations are deserving of being protected and preserved, and that Lord Ripon's clause must be abrogated or modified, so as to ensure that licensed practitioners shall also be diploma holders.

These two principles may be considered as finally agreed to; but it still remains to be decided how they may best be carried into effect, and it strikes us that a simple return to the wording of the Bill as it stood before Lord Ripon's amendment, is the most feasible means of settling the question. The rider proposed by the London College of Surgeons is, at best, a somewhat lame expedient, and we cannot see that the pretensions of a few lady doctors are of so great importance as to justify the Government in spoiling the Bill to please them, especially as the sentiment of their sex is sufficiently cared for in other parts of the Bill.

We have spoken as if there were but two points of the measure open to dispute, but we do not forget that there are many other respects in which it needs amendment. The registration of foreign and colonial degrees is, as provided for by the Bill, open to grave consideration, and the midwives' and dentists' clauses are, of themselves, enough to engender violent opposition. These latter sections have, indeed, nothing to recommend them, for they are, unnecessary, useless, and dangerous. They are not appropriate appendages to a Medical Reform Bill at all, and only serve to encumber the consideration of more important matters, and the first act of the Government should be to clear the

ground by striking out the whole of these clauses from the Bill.

Everyone who desires to see the Bill become law must deplore the fatal error committed by the Duke of Richmond in accepting Lord Ripon's amendment, and all medical reformers would rejoice if the measure were restored to such a condition as to admit of their giving it their warm support. At the present moment the subject is so embarrassed by conflicting suggestions and opposed interests that it is impossible to foretell the prospects of legislation being completed this year.

THE MEDICAL COUNCIL AND THE MEDICAL BILLS.

CONSIDERING the gravity of the situation it was to be hoped that the present extraordinary session of the Medical Council would lead to some important decisions on the subject, and would show that it was not so much divided in opinion as it was at its last meeting. Unfortunately, the Medical Council does not set about the business before it in such a methodical and practical manner as circumstances demand, and much time is wasted, as was the case on Saturday, in discussing trivial formalities, or irrelevant subjects. This is to be regretted; perhaps one plausible plea at the disposal of those who are for altering the constitution of the Medical Council, might be that the presence of half-a-dozen delegates from the great body of general practitioners would be the means of infusing a little more despatch in its discussions and transactions, as general practitioners are usually better men of business than those who move in the higher and serener sphere of consulting practice.

There may now be said to be two great rocks on which the Government Bill is likely to be shipwrecked. One is that unfortunate amendment by which the certificate of a Conjoint Board was made the sole requirement for registration. The second is the opposition of those who will not be satisfied with any Bill that does not provide for the reconstitution of the Medical Council. With regard to Lord Ripon's injudicious amendment, we were the first to protest against the profession listening to anything of the kind. Most of our contemporaries are of the same opinion, and on Monday it was decided by a large majority of the Medical Council "that it cannot approve the alterations in reference to registration, which, in the House of Lords, Lord Ripon introduced into the third and fourth clauses of the Bill, as the Bill passed through Committee on re-commitment, viz.:—"That a person can be registered upon obtaining a qualifying certificate without obtaining a diploma from a medical authority, and that the only registration title is to be Licentiate in Medicine, Surgery, and Midwifery." We have on a previous occasion pointed out how utterly inadmissible such an amendment must be. The President of the Medical Council, whose very excellent address was a prominent feature of the first meeting of the Council, on this point justly remarked that such a step as that contemplated would be followed by disastrous results. It would entail the loss of funds by which the colleges, together with their museums, libraries, and lectureships, have been heretofore maintained. "Many," he observed, "assert that in this country, where self-government has been a chief condition of growth, the consequence of so entire a change might be most injurious to the general character of British medicine . . . . . It has been said that our self-governed institutions have been the just pride, as they have been the cradle of our national funds." And as regards practical medicine and surgery in Great Britain, "it is certain that prior to 1858 the high place they held in the world was due to individual effort, and not to State aid—to self-government, and not to legal enactment; and even in 1858 the State gave force, powers, duties, responsibilities, rules, rights. It gave no funds, no edifices, no endowments."

After all, this amendment of the Marquis of Ripon is a difficulty that might be easily surmounted, as some compromise might be adopted by which the interests of the female doctors, and those of the corporations, might be equally consulted. In our last issue we noticed one way in which it was professed to get over this difficulty. Whether that arrangement will be carried out is doubtful. At all events, it is to be hoped that the Government will not pass this amendment in face of the great opposition it has met with from the Medical Council, the medical corporations, and a large section of the profession.

A more formidable obstacle to the passing of the Government Bill is the outcry in favour of an immediate alteration in the constitution of the Medical Council itself. This peremptory demand is unreasonable and untimely, and we are sorry to see that it is supported by an influential contemporary, which thinks it is clear that no Bill is likely to pass unless it provides for the change above-mentioned. We have from the first insisted upon the imprudence of impeding the progress of the Government Bill because it does not propose the immediate reconstitution of the Council. This course is impolitic for two good reasons. In the first place, it may prevent the passing of a Bill which, when the difficulty with regard to Lord Ripon's amendment is got over, would be a great gain to the cause of medical reform and medical education, and of which both the profession and the public would unanimously approve. Secondly, the time for incorporating in the Government Bill any scheme of direct representation has gone by. Such a scheme is not practicable at this present crisis of medical reform, and those who insist upon it only obstruct any legislation on the subject without the least chance of gaining the object they have in view. It has been said that it is hopeless to expect that the Medical Council will take any steps towards reforming itself, or that it will even give any advice to the Government in favour of any such reform. We give the Council more credit for its disinterestedness and its desire to do all in its power to comply with the wishes of the profession and the public. The question has not been ignored by the Medical Council, and both the President's adddress and the little discussion which has as yet taken place on the subject shows that the majority of the Council are in favour of a more direct representation as soon as the desired reconstruction becomes practicable. The President said in his address, "I hope the Government may first succeed in passing a Bill, and when this is done, for my own part I shall be glad if they will yield to the long expressed wishes of many members of the profession, and settle as soon as possible what is the

best constitution for the Medical Council of the future." It has been argued that the immediate reconstitution of the Council is necessary, because the Council is about to undertake far more onerous and responsible duties than what they have hitherto performed. But the exact nature and scope of these duties have not yet been defined, and we certainly agree with the President of the Council when he says that the best time for considering whether and by what means a Council can be produced which is better adapted to the wants of the future, will be when the Council knows what work it has to do. "The more the subject is looked into the more it will appear that the work, old and new, to be done must be first fixed, and then we may ask by what agency it can best be done."

We have all along supported the Government Bill, and provide Lord Ripon's Amendment be withdrawn or very much modified, we shall continue to support it. As Sir W. Gull, who cannot be said to be influenced by that *bête noir* "vested interests," justly remarked the attempt to defer the progress of the Bill was simply disgraceful.

DIAGNOSIS AND TREATMENT OF PLEURITIC EFFUSIONS IN CHILDHOOD.

Dr. Thomas Barlow and Mr. Robert Wm. Parker have just published some observations made by them at the Children's Hospital, Great Ormond Street, and at the East London Children's Hospital, on the diagnosis and treatment of pleuritic effusions in childhood. There is, say the authors, very little more difficulty in *discriminating* lobar pneumonia from pleurisy in children than in adults. It is when we have to do with bronchial catarrh and collapse, with broncho-pneumonia, or with the various forms of tuberculosis of the lungs, that difficulty constantly arises. They have repeatedly observed an amount of dulness due solely to collapse of lung quite equal to that produced by a localised pleuritic effusion. Although, too, broncho-pneumonia and tuberculosis are bilateral, the authors have seen three cases of bilateral empyema and three of bilateral serous effusion. With regard to the measurement of the chest, they have again and again verified Dr. Gee's observation (made with the cyrtometer) that "considerable increase in the sectional area of the chest may occur, and the length of the periphery remain the same, by the passage of the elliptical form into the circular." Rare forms of localised empyema were also met with confined to the root of the lung, or situated between the anterior edge of the lung and the pericardium, or limited to the middle third of the thorax, or localised in two different and widely-separated parts of the same side. One case of diaphragmatic empyema closely simulated hepatic abscess. With respect to the latter fact, we may observe that even at its commencement diaphragmatic pleurisy of the right side may be mistaken for hepatic or abdominal mischief, inasmuch as children often refer their pain to the wrong situation, and the affection may be ushered in by vomiting and purging. There is often, too, a good deal tenderness about the upper region of the abdomen, and bilious vomiting is often a marked feature in cases of diaphragmatic pleurisy of the right side. Moreover, the authors say nothing about the frequency with which the first symptoms of an attack of acute pleurisy point more to the head than to the chest. Their observations are certainly confined to the stage of effusion, but their experience with regard to the above fact would nevertheless have been interesting to the reader.

Passing on to another point, the delusive character of friction *râle* did not escape the attention of our authors. "In one case," they remark, "we heard a typical friction *râle* over a spot from which immediately afterwards three ounces of pus were drawn."

The difficulties of diagnosis between *serous* and *purulent* effusion are generally acknowledged. Contrary to what is usually stated, in cases of serous pleurisy there is sometimes very marked hectic, whilst with emhyema there is often a very moderate degree. The observations of the authors on this subject are very original, and worthy of attention. "It has appeared to us," they say, "that the aspect of the patient—a peculiar anæmia, with an earthy complexion—and, above all, clubbing of the finger-ends, have been the most characteristic features suggesting empyema rather than serous effusion. We have never seen a case of serous effusion accompanied by clubbing, and we have seen very few cases of empyema where it has not been present to some degree, even when the illness has been only of a few weeks' duration. So frequent is the association that, we believe, if a child be seen with general pallor and clubbing of the fingers, one ought to think of empyema rather than of the other causes of clubbing, viz., chronic bone-disease, bronchiectasis, and congenital heart-disease."

With regard to the natural course of pleuritic effusion in childhood when unmodified by surgical treatment, the authors remark that retraction of the side is not to be taken as a positive proof that absorption has taken place—that no limit of time can be enunciated as to when a serous effusion will become purulent—that the effusion may continue serous for upwards of two months—that purulent effusion is extremely frequent in children—that the shortest period at which they were able to establish the presence of pus, was 14 days—that in the great majority of cases empyema in children is not secondary to tuberculosis—that of the various modes of spontaneous evacuation of the pus, rupture through the lung appears the least unfavourable—that with regard to evacuation by external opening their experience does not supply them with a single really good result, and that the issue of a large number of these cases when left to themselves is most disastrous.

On the subject of treatment we are furnished with advice that appears to be remarkably judicious. With regard to serous effusions, the value of the exploratory puncture is urged not only as a diagnostic but as a therapeutic measure, inasmuch as cases were seen in which it was impossible to resist the conviction that the removal of a very small quantity of fluid has been rapidly followed by absorption. If the effusions be considerable paracentesis should be performed at once, not only to relieve dyspnœa, but to give the lung a chance of re-expansion before adhesions bind it down. There is very little confidence to be placed in medicines; but the external application of iodine, combined with the internal administration of iodide of potassium, has in some cases proved beneficial. As to *purulent* effusions, if the exploratory puncture

reveal the presence of pus, we are recommended to withdraw as much as possible with the hypodermic syringe. The possibility of multiple collections of pus should be borne in mind ; and if the quantity of pus be incommensurate with the extent of the dulness subsequent punctures should be made, as experience shows the safety as well as the utility of the measure. If the hypodermic syringe does not remove all the pus present, it is better to introduce the aspirator trocar (especially that of Dr. Potain, made by Matthieu, of Paris) and to withdraw as much of it as possible. In most cases, aspiration was performed under anæsthetics, in order to facilitate a thorough exploration, to avoid shock and collapse, and to avoid the troublesome cough that usually occurs after paracentesis thoracis. Chloroform preceded by small doses of brandy was the chosen anæsthetic. The angle of the scapula was the chosen place for puncture when the effusion is general. A single aspiration is generally sufficient, but successful results have been obtained after repetition of the aspiration up to six times. If the pus should become fetid, or rapidly re-accumulate in large quantity, permanent drainage is recommended ; and in all cases this should be by a double opening. If possible, the first opening should be made in front of the thorax, and the second below and internal to the angle of the scapula. A long probe, threaded with a piece of drainage-tube, may be passed downwards and backwards from the first opening, and the second incision made over the point of the probe when it is felt through the integuments. The drainage-tube should then be drawn through and secured by tying the two ends together.

Such are the most prominent points dwelt upon in the interesting pamphlet of Dr. Barlow and his coadjutor Mr. Parker. We have drawn particular attention to it as it represents, in respect of a very common and serious affection, the most recent practice and experience of a physician and a surgeon attached to the two largest children's hospitals in London.

Notes on Current Topics.

The Dublin Sanitary Authority.

We have been constantly obliged to protest against the gross neglect of the sanitary affairs of the city of Dublin by the Public Health Committee of the Corporation. Our readers may desire to understand how it come to pass that in a body supposed to be representative of the citizens, so bad a state of things should exist. If so, let them read the following very brief extract from a pamphlet on Dublin Municipal Reform, by Mr. John MacEvoy :—

"The municipal service became, to a considerable extent, a preserve for corporators, their relatives, and political servitors. In the evidence before the Parliamentary Commission at Question 1,737, some examples were given of Dublin municipal appointments. At that time there were four municipal offices filled by persons promoted to them direct from seats in the Town Council—the collector-general, the assistant of the town clerk, one of the city coroners, and a water-bailiff. Seven officers were relatives of corporators—the city marshal, the secretary of the Water Works Committee, a city assessor, the mace bearer, a water-bailiff, an inspector of weights and measures, and a store-keeper. Three officers were ex-secretaries of liberal and 'national associations'—the town clerk, one of the law agents, and one of the coroners. That many of the minor appointments have been given as remuneration for services rendered in electoral contests there is good reason to believe. We happen to know that a newly-created weigh clerk and weigh master were extremely useful to one of the aldermen at a closely-contested election a few years ago. And, although the corporation may be said to be now on its trial in its recent appointments, it follows the old rule. It recently had the election to the important office of street surveyor. As candidates for the office there were, among others, the town surveyor of Derry, whose conduct as such is favourably reported upon by the Local Inquiry Commission. On this gentleman informing the corporation of Derry that he wished to compete for the Dublin street surveyorship, the mayor asked him was it that he considered his salary of £300 too small ? if so, he was prepared to recommend to the council to retain him by advancing him to £400. The surveyor replied that it was not ; he wished for a larger field. An officer of the Liverpool Scavenging Department, with first-class testimonials, was another candidate, but he too had no 'interest.' Neither had fit candidates, it appeared, for another office. A licensed vintner, Mr. Duffy, was described (in a late newspaper report) 'as a lately appointed inspector of scavengers.' He lost his life, being at the time of the explosion, *attending to his primary duties to his customers in his public-house next* door to the foundry."

Rate-supported Hospitals.

Amongst social reformers an idea has prevailed for some time past that hospitals should not be dependent for support upon the voluntary donations of the benevolent, as it generally happens that the wealthy who are not benevolently disposed, escape the self-imposed burdens of those more liberally inclined. The *Midland Counties Herald* had an article in its last week's issue on this subject, from which we give the following extract :—

"There are many reasons why this question of rate-supported hospitals is likely sooner or later to be agitated. First of all, is the existence of such institutions a necessity ? If so, why should their support be left to the few liberal, philanthropic persons, while the many who are mean and mercenary escape ? It is something painful to see in subscription lists the same names over and over again, and others, that should be there, conspicuous by their absence. There are those in all communities who are so dead to all sense of citizenship that they will never give anything away voluntarily, which means they never give anything away at all. But such as these should not be allowed to escape their proper burdens, and the only way to trap these shy birds into doing good is by the gentle persuasion of an authorised and compulsory rate."

The idea of rate-supported hospitals has never been very popular, though it has often cropped up ; the contention being that it would circumscribe, if not altogether abolish, the almsgiving of those benevolent persons whose life and substance are so often devoted to works of charity, and who, as is the case when voluntary schools are handed

over to the School Board, withdraw their support altogether from rate-supported institutions. On the other hand, it would put an extinguisher upon those myriads of mushroom hospitals which are daily started in all large towns for the sole and especial benefit of the enterprising medico ycleped its founder.

Royal College of Surgeons of England.

THE following are the names of the eligible Fellows who are candidates for seats in the Council of the College at the ensuing election on Thursday, the 4th of July next, at 2 o'clock p.m. :—William James Erasmus Wilson, Henry Lee, Barnard Wight Holt, retiring from the Council in rotation ; John Gay, Joseph Lister, Thomas Bryant, Henry Thompson, S. John Wood, Henry Power, and Edward Lund. Mr. Adams does not come forward as a candidate lest he should reduce the chance of Mr. Gay's success. Mr. Gay has already proved himself a most energetic and useful member of the Council, and at the last election, on retiring by rotation, he lost his seat by only a few votes. He would certainly have been re-elected had not some few fellows, whose sympathies were divided between Mr. Gay and Mr. Adams, anticipated the success of the latter, and given their votes to him.

The Small-pox Epidemic in Dublin.

THE disease is, we are glad to say, abating. The deaths in the week ending June 22, were 5 less than in the preceding week, and the fresh cases admitted to hospital 26 less. 247 cases remain under treatment. The fine weather has reduced the number of deaths from respiratory diseases, and the effect has been to bring down the total death-rate to 22·5 per 1,000, which, though greater than that of London—Edinburgh, is greatly below the usual ratio for Dublin. The Public Health Committee of the Town Council, pursues with self-contained happiness, "the even tenor of its way." Death-rates may go up or come down, while they remain gloriously indifferent. If the mortality were 52 per 1,000, instead of 22, the rise would not excite them to action any more than the fall now exhilarates them.

Health of the Borough of Macclesfield.

FROM the last Annual Report of the Medical Officer of Health, it appears that good sanitary work has been done in the Borough of Macclesfield. The system of house-to-house visitation has been well carried out. Upwards of 2,300 houses have been properly inspected, the result of each inspection being entered in a book, which, when completed, will form a "Sanitary Directory," or index, of the sanitary state of each house in the borough. In carrying out this survey particular attention was given in each case to defective closet accommodation, defective drainage, noxious trades, defective ventilation, and overcrowding. Nothing is said about water supply and inspection of cisterns, but we assume these points were not lost sight of, though not mentioned in the report. The dirty state of the cisterns is in some houses very disgusting, and quite sufficient to account for the impurity of the water. From the increased attention paid to the sanitary condition of this borough, we are not surprised to hear that the death-rate is lower than it has been for many years, that there have been less zymotic disease, and a great diminution in the mortality of infants, so that the whole of the mortality bears favourable comparison with that of England and Wales. With regard to infant mortality, it will be remembered that Macclesfield has long held a very unfavourable position in the death-rates, so much so that it was reported that there was actually a large amount of clandestine child-murder in that district. The Committee appointed by the Town Council to inquire into the matter, failed to find sufficient evidence to support such a criminal charge, but it was admitted that the "infant death-rate in Macclesfield is considerably in excess of the average throughout England." The inquiry, however, and the preventive means subsequently adopted, did a great deal of good, and it is pleasant, says Dr. Bland, "to turn from the consideration of the excessive infant mortality which has prevailed in previous years to the statistics for the year 1877, which is characterised by a remarkably low mortality." In 1876 the death rate of infants under twelve months of age was 21 per cent., while in 1877 it fell as low as 11 per cent., the rate for all England being 13 per cent., which, the Registrar-General remarks, is lower than in any year since 1837.

Inert or Adulterated Drugs.

WE hear that Dr. Campbell Brown, the county analyst, has recently read a report at the Lancashire Annual Session in which he states that two samples of drugs that had been submitted to him in the course of the year—one of them made up from the prescription of a medical man—"were entirely wanting in the principal constituents."

This statement, which we take from the *Globe*, is a very serious one, and reminds us of a contingency to which we are all more or less subject. There can be no doubt that there is in the market a large quantity of inferior drugs, and that the object which the physician has in view is often defeated through the inferior quality of the drug or drugs used in preparing his prescriptions. And here, perhaps, the well-educated practitioner who dispenses his own medicines has the advantage over the physician, inasmuch as he can test the value of his medicines before dispensing them. As for the physician, he has no guarantee that the drugs with which his prescription is made up, are of the best quality. After the prescription is out of his hands he has nothing more to do with it. There are, indeed, very few members of the Pharmaceutical Society who dispense any but genuine drugs ; but independently of any fraudulent adulteration, accidents will happen sometimes in spite of every precaution taken to prevent them. Besides, the fault often lies between the wholesale dealer in drugs and the retail buyer, the former having no scruples against offering for sale, and the latter against purchasing, medicines of so inferior a quality that they ought not to enter the market at all.

Veratrum Viride in Puerperal Convulsions.

THESE convulsions are so dangerous and so difficult to manage that any vaunted remedy for it should not be too hastily discarded, provided its known physiological action justifies a fair trial of it. It appears from

the *American Practitioner* that this drug has been successfully employed by Dr. S. S. Boyd and Dr. Fearn in the treatmant of puerperal convulsions. Twenty drops of the fluid extract of the veratrum viride were given every fifteen minutes until 120 drops were taken. Vomiting and retardation of the pulse were the most prominent effects of its administration. Dr. Boyd's explanation of its *modus operandi* in these cases is also very plausible. He thinks that the effects of the drug are due to its depressing influence on the heart, and medulla spinalis, and oblongata. He believes that the eclampsia is not due to brain lesion, but to reflex action originating in the uterus, from which an impression is carried to nerve centres in the medulla spinalis and oblongata, and is thence radiated to the whole muscular system.

Water Supply for London.

THERE is every reason to believe that before long the metropolis will be provided with a good supply of water for drinking purposes. It has long been felt that not only should the water supplied to the inhabitants of London be as pure as possible, but that for putting out fires there should be always at hand an abundant supply of water under sufficient pressure to enable it to be thrown to the tops of the highest houses without the aid of engines. The engineer consulted by the Metropolitan Board of Works thought that an ample supply of pure spring water could be obtained from the water-bearing strata around London, and they proposed by wells and borings to draw from these strata about 16,000,000 gallons a day. It was proposed to pump this water to reservoirs situated at considerable heights, and to distribute it through the metropolis by a set of mains entirely separate from those through which the present water is supplied. With the view of carrying out those schemes the Board has, after full consideration, prepared two Bills, which will be laid before Parliament next session, one to enable it to purchase the undertakings of all the metropolitan water companies; and the other, to authorise it to provide a new and separate supply of pure water for potable and culinary purposes, as well as for the extinction of fires.

The Coaching Club.

A FEW days ago the second meet of the Four-in-Hand Club was held at the Magazine in Hyde Park. From this and other demonstrations of the kind that have taken place, there is evidently an inclination on the part of a certain section of the community to revive not only a pleasurable, but a very healthful, mode of travelling. As we remarked last year on the same subject, people who consult their health would do well in taking their annual holiday to patronise the stage coach more frequently than they do. The time spent in railway travelling contributes nothing to the health or pleasure of the travellers, whereas, a long journey on the top of a stage coach might from a health point of view, be regarded as one of the most satisfactory parts of the period devoted to pleasure and recreation.

The Idiots (Ireland) Bill.

MR. ARTHUR MOORE'S Bill thus designated stands for its second reading in the House of Commons. It provides that Boards of Guardians may provide for the maintenance of the blind, deaf, or those lame from deformity or disease in suitable institutions, and pay for such maintenance out of the rates. That they may do the same in respect to the maintenance of idiots subject to the approval of the Irish Local Government Board; and lastly, that they may erect suitable asylums, the Treasury contributing part of the cost.

Treatment of Ununited Fracture.

MR. FITZGERALD, Surgeon to the Melbourne Hospital, in view of the unsuccessful results attained by the milder and severer remedies commonly used in treating this troublesome accident, strongly advocates the injection of glacial acetic acid, 5 to 10 minims, by means of the hypodermic syringe, between the ununited ends of bone. His experience of this method of treatment has been uniformly successful. It is attended by sharp pain at first, but this quickly subsides. Any cartilaginous thickening that may be present is soon resolved and reabsorbed, and bony union takes place rapidly, a position of the ends of the bone being secured by well applied splints.

This treatment is certainly well worth consideration and trial.

THE epidemic of small-pox, which has prevailed more or less in London during the past twelve months, has so far abated that a resolution was carried on Saturday last at a meeting of the Metroplitan Asylums Board, to close the Stockwell and Homerton hospitals for the present. The few remaining patients at these institutions will be transferred to Deptford and Hampstead, and the buildings thoroughly cleansed.

ON Sunday last collections were made in most of the churches and chapels of the metropolis in aid of the Hospital Sunday Fund. The Lord Mayor and other civic dignitaries went in state to St. Paul's Cathedral in the morning, and to Westminster Abbey in the afternoon. It is, of course, premature to hazard an opinion of the aggregate contributions, last year it was over £26,000.

IN the principal foreign cities the rates of mortality, according to the most recent weekly official returns were—in Bombay 41, Madras 38; Paris 22; Geneva 21; Brussels 28; Amsterdam 25, Rotterdam 27, Copenhagen 23; St. Petersburgh 48; Berlin 37, Hamburg 25, Breslau 32 Munich 39; Vienna 21, Buda-Pesth 37; Naples 31, Turin 31, Venice 30; Alexandria 42; and New York 21. The 622 deaths in St. Petersburgh included 125 from fevers, and 21 from small-pox.

THE rates of mortality in the four principal cities of the United Kingdom last week, were 20 in London, 20 in Edinburgh, 23 in Dublin, and 26 in Glasgow per 1,000 of the population. Of the other large towns—Sunderland had the highest death-rate, viz., 28 per 1,000, and Nottingham and Leicester the lowest, with 13.

Lord Overstone has given £500 to the Charing Cross Hospital Fund. The Middlesex Hospital and the Brompton Consumption each become entitled to £500 under the will of Mrs. Burmester, deceased. The latter hospital receives £600 also, under the will of Mr. Dilberoghie. To the Doncaster Infirmary, Miss Parker, of that town, has bequeathed £200, and the Royal United Hospital, Bath, becomes entitled to a like amount, under the will of Mrs. Hilds.

Small-pox is now fast declining, both in London and Dublin. In the former there were but 19 deaths last week, against 42 and 24 in the two previous weeks. In the latter 13 deaths against 19 and 18 in the two previous weeks.

Several deaths from sunstroke occurred in different parts of the kingdom last week. The heat was excessive during the whole of the week, Wednesday being the hottest, when 125 degrees was reached in the sun, and 102 in the shade.

Literature.

A GUIDE TO THE EXAMINATIONS AT THE ROYAL COLLEGE OF SURGEONS OF ENGLAND. (a)

If the medical student has to direct his attention to a vast number of subjects, he cannot, at all events, complain that there is a scarcity of "helps" or "aids" in the prosecution of his studies. From the beginning to the end of his hospital career, from the study of the bones to the performance of some capital operation on the dead body, he has at his disposal the assistance of books, illustrations, *epitomés*, memoranda, demonstrations, &c., that cannot fail to guide him to that goal which is the object of his ambition. And, judging from the little work before us, the assistance we speak of does not stop until the candidate is at, or even within, the portals of that College which every English student, almost without exception, has always been desirous of passing.

This "Guide" to the examinations of the College is a much enlarged reprint of some papers that originally appeared in the *Lancet* (1876). It is published in a separate form in the hope that it may prove useful to all those who are preparing to undergo these examinations, and the fact that it has already reached a third edition is the most satisfactory evidence that could be given of its utility to students. In this Guide the candidate for either the Membership or the Fellowship of the College will find all the information he requires respecting the manner in which the written and oral examinations are conducted, the kind of questions submitted to the candidate, the practical examination on anatomy, the clinical examination of patients, the practical examination on pathology and surgery, &c. The book also contains an account of the chief anatomical, pathological, and microscopical preparations or specimens with which he is expected to be familiar; a list of the various surgical instruments and apparatus used by the examiners; and a complete series of examination papers from January, 1869, to July, 1877. The candidate is sure to obtain from these papers a good idea of the kind of questions that will be put before him, and perhaps, before going up to the College, he could not employ a few hours more profitably than by writing out answers to some of the many questions to be found in this manual. Mr. Gant states that his Guide has had a marked influence in inducing the student to gain a more practical and personal knowledge of his subjects, to frequent more regularly the College museum, and thereby to acquire a familiarity with the large and instructive collection of specimens and preparations contained in this splendid museum. We can easily imagine that such has been the case, and did the book serve no other purpose than that of sending numerous students to the galleries of the museum, it would still have some claim upon the attention of both the student himself and all those who are interested in his success.

Nor does Mr. Gant by any means encourage those fears and misgivings with which many candidates approach their examinations. The following quotation, with which we shall close these remarks, will both show the style of the work and the author's desire to remove any unnecessary apprehension the candidate may feel on the eve of presenting himself before examining board:—

"One feature in these practical examinations seems especially worthy of notice—it is the freedom from any embarrassment or difficulty to the candidate, assuming him to be well prepared. This agreeable circumstance is partly due to the objective character of the examination, whereby readiness of language and much descriptive power are not at all essential to success, and the composure of the student is aided by the calmness and considerate bearing of the examiners. In one case a candidate who laboured under great impediment of speech, but who evidently possessed the requisite knowledge, was facilitated by answering in writing, just a word or two on a piece of paper with a pencil being quite sufficient to the questions—'What's this?' and 'What's that?'"

A REVIEW OF THE MEDICAL WORKS PUBLISHED IN FRANCE FOR THE YEAR 1877.

1. "Manuel de Medicin Operatoire," de J. F. Malgaigne, Huitieme edition. Par M. Leon Le Fort. 2 vols. 12 mo, avec. 744 figures, prix 16 f. Paris et Londres, Baillière.
2. "Traité Pratique d'Anatomie Medico-Chirurgicale." Par M. R. Richet. Cinquieme edition. 1 vol. 8vo, de 1,335 pages, prix 19 frs. Paris, Lauwereyns.
3. "La Prostitution a Paris et à Londres." Par M. Lecour, Chef de Division a la Prefecture de Police. Paris, Asselin.
4. "L'Etude Medico-Legal sur les Epileptiques." Par Le Docteur Legrand du Saulle. 1 vol. 8vo, prix 4 frs. 50 cent. Paris, Delahaye.
5. "Dictionaire de Medicin et de Therapeutique Medicale et Chirurgicale, &c., 3rd edition, 1 fort., vol. de 1,559 pages, avec. 907 figures. Par MM. Bouchut et Despres. Prix 25 frs.
6. "La Charitè à Paris." Par M. Lecour. 1 vol. 8vo, Asselin.
7. "Guide d'Electrotherapide, Redigés d'Après les Travaux et les Legons du Dr. Onimus," par Bonnefoy. 91 figures dans le text, 1 vol. 8vo. Paris, Masson.
8. "Traitment de la Variole par le Bains Froid." Par le Monsieur le Dr. Clement. Geneva, Geary.
9. "Cour de Medicin du Collège de France; Leçon sur le Diabete et la Glycogedese Animale. Par M. Claude Bernard. 1 vol. 8vo, prix 7f. Paris et Londres, Baillière.
10. "Crémation ou Incinérations des Corps." Par A. Cadet. Vol. 1., 18o, prix 2f. Paris et Londres, Baillière.
11. "Les Syphilitiques de la Campagne de Fernand Cortes." Par le Dr. Jourdanet. Paris, Masson.
12. "Traité des Maladies de la Prostate." Par Dr. H. Picard, 1 vol. 8vo. Paris, Baillière.
13. "Memoirs sur la Galvano-Caustique Thermique." Paris et Londres, Bailliére.
14. "Manuel de Thérapeutique." Par le Docteur Paulier, 1 vol. 8vo, de 1,012 pages, prix 10f. Paris, Doin.

An acquaintance with French opinions and medical literature, is now expected from every educated physician and surgeon, but the press turns out annually such a large number of works, that a selection is difficult, and many works are bought which on perusal turn out unworthy not only of the trouble of printing, but also of reading. Authors have their ambition, printers have their business and interest in the production of new books, and readers are oftentimes their victims. It has been said there never yet was a work produced so bad, that something could not be learnt from it, but time is so limited and so valuable, that our readers can hardly be expected to purchase a number of books, in the hope of finding a good one, so that we have selected a few of the principal interesting works that have appeared during the year 1877, and which may be purchased and usefully added to the physician's library.

1. "Manual of Operative Medicine." By Malgaigne. 8th edition. Edited by Le Fort.

This is a standard French work, testified by its running through eight editions, though it bears the critical spirit of

Malgaigne: M. Le Fort has brought it down to the present time, and contributed some valuable additions.

The value of plates cannot be over-estimated in assisting surgical descriptions, and this work is rendered more valuable by the numerous excellent illustrations. We may say it is one of the best French treatises, and will prove of valuable assistance to the surgeon.

2. "A Practical Treatise on Medico-chirurgical Anatomy." y Richet. 5th edition.

This is another standard French work, and its popularity is also vouched for by a 5th edition. It has the character of being about the best treatise on regional anatomy, and this praise, accorded it by French writers, is a high one, when we consider the numerous publications on anatomy issued by the French School of Medicine.

3. "Prostitution at Paris and London." By Lecour.

Those interested in such social inquiries, and in the operation of the Contagious Diseases Act, will find in this work, ample and official information.

The French system of registration and inspection seems to have a beneficial influence. Our own pages have lately testified to the diversity of opinion existing on the value of the Contagious Diseases Act in England, and figures are quoted on both sides in support of the rival theories. The fountain-head of information must be sought in France, and this work offers a cheap and readable medium of obtaining it.

4. "Medico-legal Study on Epileptics." By Legrand Du Saulle.

The criminal responsibility of the insane is one of the most difficult questions in medical jurisprudence, though Maudsley has added a valuable contribution to its solution.

As a medical expert to the French courts, and physician to the Bicêtre, Dr. Du Saulle speaks with a practical experience of the subject, and his chapters on homicidal epilepsy, and epilepsy larvée, are models of their class. Jurists disagree with medical men on homicidal impulses, but as Dr. Du Saulle advises us, medical men should affirm the truths they believe with authority, even at the risk of unpopularity, and we should impress society with the fact that though we are servants, we are also honourable men.

5. "Dictionary of Medicine." By Bouchut and Després.

If a condensed volume of French medicine is desired, a standard work of reference on almost every point, no better book could be purchased than the dictionary of MM. Bouchut and Despres.

It is a veritable Encyclopædia, and for facility of reference is based on the *alphabetical* plan. When we mention that it is illustrated with 907 drawings, and contains 1,559 pages, our readers can imagine the amount of information contained.

Its popularity has been so great that it has already reached a third edition, brought down to our present standard of knowledge.

6. "Charity at Paris." By Lecour.

This small volume deals with the various forms of the French system of relief, and thus has an interest in revealing the mechanism of the Parisian hospital administration. We have noticed above another work by the same author on prostitution; his official position in connection with the police renders his information on the distribution of charity all the more valuable.

7. "Electro-therapeutical Guide." By Onimus.

Now that electricity plays such an important part in the cure of disease, a knowledge of its use and action should be familiar to every practitioner, for, as Dr. Onimus tells us, electricity is not a specific, and should not be reserved for exceptional cases. This is a very complete manual on the subject.

8. "Treatment of Variola by Cold Baths." By Dr. Clement.

The results obtained by cold baths are not sufficiently satisfactory to attain its universal adoption, though this treatise affords some interesting particulars of their application at Lyons.

9. "A Lecture on Diabetes, &c." By Claude Bernard.

The name of the late M. Bernard, will of itself secure readers, for his name is as familiar in England as it is in France, and anything from his pen is well worthy of the attention of the physiologist.

10. "Cremation." By Cadet.

The zeal of some enthusiasts on the subject has not been up to the present sufficient to secure its universal adoption, for customs so bound up with religious belief, as the ordinary burying of the dead, cannot be swept away in a day, or even in a generation.

In this utilitarian age, a much more servicable use might be made of the bodies of those who are indifferent as to their disposal after death, viz., they might leave them by will to some of the schools of medicine for dissection and subsequent cremation. A good supply of subjects would thus be secured, and many of the deceased would have the satisfaction of framing a will with a direct object of benefiting posterity. Shelley preferred having his body destroyed by fire, Bentham had a preference for utilitarianism, and made choice of the *post-mortem* room. *Chacun a son goût.*

M. Cadet's treatise is a very interesting and popular treatment of the subject.

11. "Syphilis in the Campaign of Cortes." By Jourdanet.

The origin of syphilis has always been a subject of interest, and this is a short study to the elucidation of the problem. Was syphilis known before the arrival of the Spaniards in Mexico? Was it known in Europe before Columbus returned from his voyage? Dr. Jourdanet has not conclusively settled these questions.

12. "Treatise on Affections of the Prostate." By Picard.

This is one of the most complete French treatises on the subject, and we can recommend it as an accurate and valuable work of reference.

13. "On the Galvano-Cautery." By Amussat.

We have expressed our opinion on this book in January, 1877, and we believe it will help to popularise the employment of a means of treatment which is still attracting increased attention.

14. "Therapeutical Manual." By Paulier.

This publication has been well received, and forms an excellent guide to the student who desires to acquaint himself with the materia medica of our French *confrères.* It is clear, methodical, accurate, and scientific.

(To be continued.)

Correspondence.

THE NEW MEDICAL BILL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I read with much pleasure a letter which appeared in your paper this week under the above heading, signed "Vale." There are, indeed, a number of medical men who own open surgeries, which are worked by resident dispensers; but, as to how far that tends to lower the profession, is a question which admits of argument. If a surgeon keeps a third-rate chemist's shop, works it himself, in other words is his own shopman, I will say that is going rather too far down the social scale. Perhaps deigning to trade at all, may not be quite the thing. But why on earth, Mr. Editor, should we deprive medical men of the right of trading or shopkeeping, or indulging in commercial transactions of any kind, when peers of the realm, officers of both services, magistrates, lord-lieutenants of counties, landed proprietors and esquires, and gentlemen of every shade and degree, can do the same thing with impunity, and be considered none the worse. Surely, "Vale" forgets how many gentleman of the period owe their wealth and their position in society to the shop. In fact, if it were not for the coin that the much despised shop, mill, or trade, brings in, we should hear or see nothing of many who now flourish and enjoy good position in this world of rank and fashion. Once more, why cannot a medical man enjoy the same opportunity of amassing money? the answer is—simply he is a man of medicine—alas, we are poor beggars! We are sure to get the most bamboozling, and if anyone is to be played a dirty trick, the medical man is the scapegoat. How do we fare in the law and coroner's courts, at the board of guardians, (Bumble, in all his glory and despotic power *pro tem.*, likes a shy at the parish doctor), the quarter-deck of Her Majesty's ships, &c., if there is any

argument, nay, even if the doctor is right, and he sticks up for his right, ten to one but he has a hard battle to maintain it, and has to put up with treatment and speeches which he would never have heard had he been anyone else, save the doctor. The practice of medicine and surgery has never been recognised in Society as a pure profession, because as well as prescribing drugs and remedies, the medical man has in the majority of cases, to mix the said drugs and medicines; and it matters not to the public whether mixtures, draughts, pills, &c., are supplied from the open surgery, *alias* shop in front, or from the closed one in the rear of the doctor's house. In both cases the surgeon is a trader; he sells goods, and until Act of Parliament forbids medical men supplying medicines in any way or form, or through any channel, so long will we be looked upon in the light of tradesmen. "Vale" has over-looked another class of surgeons who ruin the profession by accepting clubs and unions at the present ruinous and degrading rate of payment. Can we get servants to work for us after the same rate? Not they! No, no, they are a deal too wise in their day and generation to work under the mark; they would strike sooner, I suppose we are too gentlemanly to do that, and excuse ourselves under the plea of humanity, but the public are not humane enough to reward us properly for our services, as such services ought to be rewarded. How many a hard-working club and parish doctor has shortened his life by working for the miserable pittance the board of guardians and stewards of clubs offer him, and if he refuses to take the allowance, calmly tell him there are plenty of medical men who will be glad to take such appointments, at the price offered, or even for less. Alas, it is too true, more shame to us as a body, and I challenge truth and common sense to deny it. I say there is more shame in thus working for such appointments than there is in owning a chemist's shop. Under the former system one is no better than a toad under a harrow, whereas with the latter there is more or less of independence. I always refused clubs upon the principle that I would never accept a ten pound note for a hundred pounds worth of work, and I believe that fairly represents the ratio payment of club and parish doctors for their services. A chemist would scout the idea of finding medicines alone for each club and parish patient on such losing terms, as the doctor is content to find visits, advice, and medicines inclusive. Well, I suppose we are the very essence of charity. I am sure we are often long suffering, and so brimful of the milk of human kindness, that we, as a body, are contented to work for nothing at all. If we rise to the upper ranks of the profession, what parliamentary remedy have we? What positions in the Government of our country are open to us? None. There are no bishoprics or judgeships in medicine. Even honours in the shape of decorations are denied the medical officer, when they are given profusely to combatant and other officers. The fact of being medical men puts us often out of the pale of reward. Do we not read of officials of hospitals being knighted, when the senior physician or surgeon have been overlooked, and no reward or distinction at all granted to them. At present, the public have the whip-hand of the profession, but let us join shoulder to shoulder, and be true to each other, and things will soon be different. In fact, it would be then worth a fellow's while to qualify and enter the profession; but as things are now, the wiser a young man is, and the more regard he has for personal comfort, the wider berth he will give Medicine and Surgery.

I am, Sir,

Your obedient servant,

HENRY W. WILLIAMS, M.D.

168 Fulham Road, S.W.

LET US REFORM OUR SPELING!

A leter from Dr. GEORGE HARLEY, F.R.S., *writen to the* ED. MEDICAL PRES AND CIRCULAR. *without encumbering it with superfluous duplicated consonants.*

TO THE EDITOR OF THE MEDICAL PRES AND CIRCULAR.

SIR,—I have perused with much interest the leter in your to-day's journal, from a corespondent signing himself "Excelsior," with the graphic heading, "Let us Spell," and I am exceedingly obliged to him for the friendly way he has comented on my efort to economise time, labor, and material, in literary pursuits, by entirely abolishing al the redundant, and consequently, useles, duplicated consonants with which English words are at present heavily weighted.

I quite agree with him that I might have gone a step further, and proposed the abolition of al the superfluous vowels also; but I refrained from doing so simply because I did not desire to thwart reform by asking John Bull to agree to so sweeping a reform as this would imply al at once.

Our language, as every philologist knows, poseses a superabundance of totaly useles vowels, as wel as consonants, which oftentimes give an eroneous speling to our pronunciation, particularly embarasing to children and foreigners. Thus, for example,

We say	hed	and yet	write	head.
,,	kurnel	,,	,,	colonel.
,,	led	,,	,,	lead.
,,	core	,,	,,	corps.
,,	spred	,,	,,	spread.
,,	det	,,	,,	debt.
,,	dout	,,	,,	doubt.
,,	colum	,,	,,	column.
,,	receit	,,	,,	receipt.
,,	plow	,,	,,	plough.
,,	enuf	,,	,,	enough.

Al under the eroneous idea—imbibed at school—that the words are so spelt—contrary to pronunciation—on good etymological grounds, which idea, however, recent research has shown originated in the eroneous system of teaching etymology at our schools. As an example of this I shal quote the very word that your corespondent, "Excelsior," takes exception to—Needles. He says this is not need*less*, but needles, the instruments with which our housewives stitch our garments. I, on the contrary, opine that it is not my speling, but his, that is wrong. Needles is, in fact, need-les in pronunciation, just as much as needless itself is. Whereas, pronounce the housewive's needles as you wil, you can never make it yield its imaginary sound. Which would be more corectly symbolised either by needels, or by needils. So that my form of orthography has the double advantage of shortening our labour in writing, by leaving out a need-les leter of the alphabet, and in directing atention to an eroneous form of speling.

It wil be observed, too, that I do not in the first instance, propose the abolition of al redundant consonants, but only the redundant duplicated ones. Such as the duplicated b's, c's, d's, f's, g's, l's, m's, t's, &c., &c., with which our language is fearfuly over-weighted. Only fancy; over thirty thousand of them ocur in every single copy of the daily *Times!* Fifteen thousand of which are totaly useles as indicators of the pronunciation of the words in which they ocur.

A friend has made the calculation that to the proprietor of the *Times* by their abolition alone, would be efected a pecuniary saving, in the form of space, time, and material, of from eight to ten thousand pounds per anum!! Some reader may perhaps smile, and exclaim, "This canot be." Nevertheles, by calculation he wil find it to be a fact. Perhaps he wil feel stil more astonished were I to calculate for him the anual amount of time and labor he needlesly throws away in his own private corespondence. For his quiet meditation I may inform him that, by a critical calculation based upon the Post-ofice statistics, I have ascertained that the corresponding part of the British public, in leters of corespondence alone, not including post-cards or circulars—only leters. In the year 1875, wrote and sent through the Post-ofice over twenty thousand milions (!) of superfluous duplicated consonants. What a waste of time, labor, and material does this not represent? Now, be it remembered, this does not refer to redundant consonants as a whole, but merely to redundant duplicated ones. And it is only the abolition of the redundant duplicated ones which I am now advocating. For four potent reasons:—1stly. It requires no mental efort to omit a duplicated leter of the alphabet from a word. And I know from personal experience that the hand, even in rapid writing, gets used to the change after three days practice. 2ndly. The reform neither interferes detrimentaly with the ordinary literature of the past or of the present. 3rdly. It would be a great boon to the poor child in acquiring a knowledge of English orthography. Many a task would be lightened, Many a punishment avoided, many an over-taxed brain relieved. How wel do I myself remember having been locked up for an hour on acount of suposed obstinacy because I repeatedly spelt puzzle with one z, and hazard with two. And wel, also, do I remember that even this dire punishment failed to prevent me for years afterwards forgeting which of the two words ought to have the double useles z thrust into it. 4thly. The abolition of duplicated consonants alone from English words

would be a *pecuniary* saving to the nation of not les than two milions of pounds per anum!

Are these four facts not worthy of the atention of the educated? I think they are, and I think that the profesion should act upon the sugestion of "R. B.," in his leter to the *British Medical Journal* of the 15th inst., which he embodied in these words :—

"Ours being considered one of the learned profesions, its members need not fear the imputation of ignorance ; therefore, if there could be a general agreement amongst us that we should, in our corespondence and publications adopt Dr. George Harley's method, the public would soon folow our example."

I have, ever si ce the publication of my monograph on the subject of "The Simplification of English speling," (*a*) a year ago, writen al my l-ters and papers without encumbering them with superfluous duplicated consonants, and in order to prevent people marveling at what, at first glance, might apear strange speling, I have had printed in neat leters, in the uper left hand corner of my note paper—

Reformed Speling !
No duplicated consonants
except in Personal Names.

I make an exception in favour of personal names, for, as a man has a legal right, in this country, to cal himself by what name he chooses, it is, I think, but proper that he should have the right to spel his name in whatever maner suits his fancy. I have refrained from atacking duplicated vowels, as they are in most cases esential elements in the words. Not so, however, with simply redundant "non-duplicated" ones. Thus, were we to omit the duplicated vowels from such

Words as beet it would instantly become bet
" boot " " " " bot
" good " " " " god
" soot " " " " sot

And so forth, so I leave them alone. But I should extremely like to see "Excelsior's" proposal of doing away with the redundant "single" vowels adopted, and instead of speling—

bread, spel it simply as it is pronounced, bred
spread " " " spred
dialogue " " " dialog
harangue " " " harang
sewer " " " suer

What an enormous saving of time, labor, and money would such a system of national speling reform efect! And would it not, as "R. B." sugests, materialy redound to the honor of the medical pres of this country if it led the way to such an important species of reform. It might easily begin to print its journals without any superfluous duplicated consonants, and once the public eye had become acustomed to the inovation, proceed a step further, and print them without any redundant leters of the alphabet whatever? The first step would encounter but litle oposition, if any at al, from the enlightened. For I have already found, from personal expe-rience, that al the advanced philologists, without, I believe, a single exception, are in favour of this simple system of re'orm. Therefore, I canot believe that any member of the medical profesion, after studying the subject, would seriously think of oposing the movement. I may conclude by remarking that I sent a printed leter to Lord Beaconsfield on the subject, pointing out the political importance it would be to the Nation to have a more simple and les irational system of orthography, and I am led to understand that the sugestions it contained met with aproval. So that the medical pres of the country need have no fear that its reputation for enlightenment would sufer from its taking the initiative in a scheme of National reform which habit, prejudice, and ignorance alone wil atempt to opose. I herewith enclose for your perusal and coment both my monograph on "The Simplification of English Speling," and my pamphlet to Lord Beaconsfield.

Faithfully yours,
GEORGE HARLEY.

25 Harley Street, W., 26th June, 1878.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The impression left on my mind after peru-ing the interesting and instructive matter contained in Dr. George Harley's recent paper, which was referred to by a correspondent in your last issue under the *nom de plume* of "Excelsior," was, that this physician must have employed as an amanuensis, an aged hospital patient whose education had been of the simplest and most primitive kind.

The remarkable mixture of good and evil in the letter makes me think of a mayonnaise of lobster with a handful of gravel mixed up in it.

Yours, &c.,
J. C. T.

(*a*) This litle book—treating the subject philosophicaly, as wel as philologicaly, is sold by Trübner and Co., Ludgate Hil, at 2s. 6d. But I shal be hapy to send a copy of it, gratis, to any of your readers who are interested in the mater.

RECENT ADMIRALTY REGULATIONS FOR MEDICAL ATTENDANCE ON THE COASTGUARD.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The regulations of the Lords of the Admiralty for medical attendance on the coastguards seem to be much in need of reform. You are doubtless aware that all round the coasts certain medical men are appointed to attend the different coastguard stations, who are designated, "Surgeons and Agents," and who act under the immediate supervision of the Medical Director-General of the Navy. Their pay for medical services is as follows, viz., 2s. 6d. for each visit to a patient, officer or man, and one shilling a mile for travelling expenses to the different stations, back mileage not allowed, and no charge allowed for medicines or medical appliances ; only five shillings per quarter is allowed for stationery. These regulations have been in force for upwards of twenty years without change ; but recently they have been so far changed as to order that "*daily* visits to patients will not be paid for except in cases of undoubtedly severe character," thus interfering with their necessary and proper treatment.

Sure y, sir, the time has come when the Lords of the Admiralty should afford a better remuneration to their surgeons and agents.

Could our *Medical Association* not do something for us? Could they not bring sufficient pressure to bear on the Lords of the Admiralty, or use such influences with them as would induce them to either allow back mileage in travelling expenses, or to make the visiting fee 5s., instead of 2s. 6d., as at present, or allow a proper charge for medicines?

Trusting that the Association will endeavour to do something for us,

I am, Sir,
Yours respectfully,
A SURGEON AND AGENT.

CORONERS' INQUESTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In looking over the MEDICAL PRESS AND CIRCULAR, I find that in Dublin there is a dispute about what doctor should be called on inquests, while in this co. (Armagh) the grievance is that the coroner ignores all alike. There have been four held within about a mile of my residence the past year, in neither was I called on, or any other, although in two I had attended before death, and in one of the four could have given most important evidence, and which would have changed the whole aspect of the case, and prevented a miscarriage of justice and permanent and grievous injury to others.

Your obedient servant,
DISPENSARIUS.

Medical News.

Royal College of Surgeons of England.—The following received the diploma in Dental Surgery at a meeting of the Board of Examiners on June 25th :—

Ackery, John, Camberwell.
Bennett, F. Joseph, George Street, Hanover Sq., W.
Burt, Walter, Weymouth.
Fothergill, Edward, Northgate, Darlington.
Galpin, G. Luck, Great Marlborough St., W.
Henry, Martin, King William Street, E.C.
Hepburn, Duncan S., Nottingham.
Keen, Edward, M.R C.S., Chelsea.
Kennedy, John B., Scarborough.
Newton, J. N. Peill, Liverpool.

Noble, Charles J., Acton, Middlesex.
Stevenson, Louis, Edinburgh.
Taylor, Arthur, Sutton Coldfield.
Underwood, A. Swayne, M.R.C.S., Bedford Sq., W.C.
Winterbottom, Augustus, F.R.C.S., Sloane St., S.W.
Woodward, F. Herbert, Prince's Terrace, N.W.

Eight other candidates failed to pass.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

NOTICE TO SUBSCRIBERS.—Subscribers who have not already paid their subscriptions for last year are reminded that they are now due and should be sent to the publishers, who will be happy to acknowledge their receipt.

MR. JAMES SHAW.—Your letter in reply to the article in our last number "On the Irish Apothecaries' Company as a Licensing Body" received as we were going to press. It will be shown to the writer of the article, and will appear together with his reply in our next. Had your communication been addressed to the Dublin office delay would have been avoided, as each department is kept distinct.

OBSTETRICAL SOCIETY OF LONDON.—This evening (Wednesday) at 8 p.m., Specimens and Microscopic Sections illustrating Changes in the Uterus resulting from Pregnancy, by Dr. John Williams. Papers: Dr. John Williams, "On some Changes in the Uterus resulting from Pregnancy, and on their value in the Diagnosis of Parity." Dr. A. W. Edis, "Case exemplifying the difficulty of Diagnosis in Abdominal Tumours." Mr. Brewer, "Labour complicated with Ovarian Cyst."

DIPHTHERIA IN ST. JOHN'S WOOD.

DR. HOWELL complains that we did not quite represent his opinions in our annotation last week upon this subject, and wishes us to give the following as a fair *résumé* of his views from a local paper: Dr. Howell, who is a well-known supporter of the *contagium vivum* school of pathologists, believes that these diseases are produced by living organisms similar to those minute microscopic objects called bacteria. He considers a cesspool to be a suitable soil for those minute germs to multiply in with fearful rapidity. The contents of a cesspool would only affect health by substituting its noxious gases instead of the fresh air which we ought to breathe, but would not produce typhoid fever or diphtheria; but let one of the minute bodies which are the cause of the disease be placed in the cesspool, then the whole becomes rapidly infected, and the germs are multiplied and are carried to many distant places by the same means by which they were brought into the cesspool."

We may add in connection with this matter, that a new sanitary committee for the St. Marylebone parish, which includes St. John's Wood, has been appointed, which includes the names of such well-known reformers as Prof. Huxley, Dr. Richardson, and Dr. McGrigor Croft; the inhabitants may, therefore, rest content that everything will be done scientifically and practically to avert future visitations of these epidemics.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Klemm, Riga, Russia. Prof. Ulrich, Bremen. The Surgeon-General of the United States Medical Service, Washington. Dr. Chapman, London. Mr. Alex. D'Orsey, Bayswater. The Secretary-General Société de Medicine Legale. Mr. Hodson, Beverley. Dr. Symes Thompson, London. Dr. Stokes, Dublin. Dr. Nicholls, Chelmsford. Dr. Stretch Dowse, Hornsey. Surgeon-Major Curran, Sitapur, India. Dr. Laffan, Cashel. The Secretary Charing Cross Hospital. Dr. J. W. Martin, Portlaw. The Registrar of the General Medical Council. VACANCIES.

Baltinglass Union, Baltinglass Dispensary.—Medical Officer. Salary, £140. Election, July 9.

Birmingham, Queen's College.—Professorships in Materia Medica and in Pathology: also an additional Demonstrator in Anatomy. Applications before July 11 to the Secretary of the College, 21 Paradise Street, Birmingham.

Carmarthen Infirmary.—House Surgeon. Salary, £125, with lodgings, but not board. Applications to the Secretary, 58 King Street, Carmarthen.

Ennistymon Union, Broadford Dispensary.—Medical Officer. Salary, £100. Election, July 11.

Greenwich Union Infirmary.—Assistant Medical Officer. Salary, £100, with board and lodging. Applications at once to the Medical Officer at the Infirmary.

Leicester Borough Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board and lodging. Applications before the 18th inst. to Dr. Finch, at the Asylum.

Middlesex Hospital.—Lectureship on Psychological Medicine. Applicants must address the Dean of the Medical School.

Owens College, Manchester.—Demonstrator in Anatomy. Salary, £100 Applications, with testimonials, to the Registrar before July 15. (See Advt.)

Roscommon County Infirmary.—Apothecary and Registrar. Salary, £60, with apartments and allowances. Election, July 19.

Swineford Union, Foxford Dispensary District.—Medical Officer for temporary duty. Emolument at the rate of £3 per week. Immediate application to the Hon. Sec. (See Advt.)

APPOINTMENTS.

COWIE, D., M.B., C.M., Medical Officer for the Cowcaddens District of the Barony Parish, Glasgow.

CRUICKSHANK, B., M.D., Medical Officer and Public Vaccinator for the Parish of Cawdor, Nairnshire.

FURLONG, J. J., L.A.H.D., Non-resident Apothecary to the Limerick Union Workhouse.

HUNTER, W. L, M.B., C.M., Medical Officer for No. 3 District of the Bierley Union, Yorkshire.

JACKSON, T. W., L.R.C.P.Ed., M.R.C.S.E., Medical Officer to the Chorley Union Workhouse.

LLOYD, G. J., L.S.A.L., a Resident Surgeon to the Queen's Hospital, Birmingham.

MAIN, A. J., M.D., L.R.C.S.Ed., Medical Officer for the Embleton District of the Alnwick Union, Northumberland.

O'CONNOR, M. R., M.D., C.M., second Resident Medical Officer to the Limerick Union Workhouse.

SMALLMAN, B. F., L.R.C.S.I., L.K.Q.C.P.I., House Surgeon to the General Infirmary, Hull.

TWINING, Dr. F. F., promoted to be first Assistant Medical Officer to the Metropolitan Asylum District Asylum at Homerton.

ARMY MEDICAL DEPARTMENT.—Surgeon-Major A. F. Bartley retires on half-pay.

BOMBAY MEDICAL ESTABLISHMENT.—To be Surgeons-Major—Surgeons W. Gray, D. E. Hughes, M.D., T. Holmsted, T. Cody, and J. Raby. Surgeon A. J. Leggatt has resigned.

MILITIA MEDICAL DEPARTMENT.—Surgeon-Major J. Briscoe (Oxford) resigns his commission; Surgeon D. Curme (Dorset) to be Surgeon-Major, under the provisions of the Royal Warrant of 12th July, 1876.

Marriages.

STROVER—MATHEW.—June 25, at Hendon Church, Walter Strover, M.R.C.S., to Emily, daughter of Charles Mathew, Esq., of Hornsey.

THOMSON—STOKER.—June 27, at St. Peter's Church, Dublin, William Thomson, F.R.C.S.I., to Margaret Dalrymple, younger daughter of the late Abraham Stoker, Esq., of the Chief Secretary's Office, Dublin Castle.

VERDON—BAINES.—June 26, at Naburn Church, Walter Verdon, F.R.C.S., of Brixton, to Mary Frances, daughter of W. M. Baines, Esq., of Bell Hall, York.

Deaths.

ATKINSON.—On June 18, at Jersey, Warner Atkinson, M.R.C.S.E., Surgeon-Major, 53rd Regiment, aged 39.

BRAND.—On June 18, Samuel Elwin Brand, M.R.C.S.E., of Cornhill and South Hackney, aged 51.

CARGILL.—On June 22, at Newcastle-upon-Tyne, John Cargill, M.D., aged 67.

COOPER.—On June 22, at Wigston Magna Hall, Leicestershire, Alfred Cooper, M.R.C.S.E.

DAWSON.—On June 11, at Bridlington, Yorkshire, Charles W. Dawson, L.S.A.L., aged 37.

HOWAT.—On June 21, at Waterbeck, Ecclefecham, Hoddam, Dumfriesshire, William Brown Howat, M.B., C.M., L.R.C.S Ed., aged 28.

HOWELL.—On June 17, at Ootacamund, Thos. G. Howell, M.R.C.S.E., Surgeon-Major, Madras Native Infantry.

MORGAN.—On June 14, at Lowestoft, Suffolk, Charles Morgan, Surgeon, aged 54.

MORGAN.—On June 19, at Aberystwith, Edward Morgan, Surgeon, aged 45

MOULD.—On June 19, at Plympton, John Arnold Mould, M.R.C.S.E., Deputy Inspector-General of Hospitals, aged 71.

SHEDDON.—On June 29, in London, Arthur W. Sheddon, M.D.

SMITH.—On June 14, found dead in the River Nene, George Smith, M.R.C.S.E., of Northampton, aged 65.

SPENCE.—On June 16, at Bedale, Yorkshire, John Spence, F.R.C.S., aged 73.

TIDBOALD.—On June 19, at Chulmleigh, Devon, John Adams Tidboald, M.R.C.S.E., aged 73.

IRISH POOR-LAW INTELLIGENCE.

IRISH MEDICAL ASSOCIATION.

ANNUAL GENERAL MEETING,

Held at the ROYAL COLLEGE OF SURGEONS IN IRELAND *on* MONDAY, THE 3RD JUNE, 1878.

DR. A. O'KELLY NOLAN (Gort.), Vice President for Connaught, in the chair.

REPORT OF COUNCIL FOR THE YEAR ENDING 31ST MAY, 1878.

(*Continued from our last.*)

Registration of Births and Deaths, &c.

It will be remembered that the Bill to amend the "Registration of Births and Deaths (Ireland) Act. 1863," which was drawn up by your Council, and presented to Parliament by the Right Hon. the Earl of Donoughmore, at the instance of Sir Michael E. Hicks-Beach, late Chief Secretary for Ireland, was adopted as a Government measure, and only awaits the convenience of the Government to be taken up and proceeded with. During the past year the Council addressed several communications to the Earl of Donoughmore, and also to the Attorney-General for Ireland, urging that this much-needed and important measure might be brought forward this session; but your Council regret to state they are informed that, owing to the state of public business in Parliament at present, it is not likely that this Bill will be considered this session, but that, nevertheless, it shall be brought forward again, at the earliest convenience of the Government.

The Dispensary Medical Officer, whose case was referred to in the Quarterly Reports, who, as Registrar of Marriages had been summoned to give evidence on behalf of the Crown, relative to a forged certificate, acting upon the advice of the Council, applied to the Under Secretary at Dublin Castle for payment of his fee and expenses, and in reply received an order for payment of a fee of one guinea, and ten-shillings for car-hire (the amount of expenses claimed); but as it appeared to the Council that their correspondent was, by the recent orders of the late Attorney-General for Ireland (in consequence of his not being a resident in the town in which the Petty Sessions were held), entitled to a fee of two guineas, they advised him to apply for that amount, but as yet have not heard the result of his application.

Poor-Law Union and Workhouses Amalgamation Inquiry Commission.

Your Council, having observed that a Commission had been appoidted by Parliament to inquire into and report upon the advisability of amalgamating Poor-Law Unions in Ireland, deem it right, in the interests of the workhouse Medical Officers, the sick poor, and the public, to offer all the assistance in the power of this Association to afford, to the Commissioners; and directed your Hon. Secretary to enquire, with that view, what subjects would be considered by them. The Secretary, in his courteous reply, forwarded a manuscript copy of the warrant, under which the commission was appointed, from which it appeared that it was empowered to consider:—

1.—The expediency of dissolving and amalgamating certain Unions; and report which, or what portions thereof, should be so dealt with.

2.—The re-arrangement of the present Dispensrry districts.

3.—The expediency of dispensing wholly, or in part, with existing workhouses, and providing proper accomodation for the sick thereof; and what provision should be made for the removal of the aged, sick, and infirm-

4.—Whether additional accomodation is required for the adequate relief of the sick poor, considering distance from the workhouses.

5.—Whether the workhouses to be dispensed with might be made available for the reception and treatment of the lunatic poor, or other purpose; and

6.—Generally to investigate the changes, if any, required in the existing distribution of destitute poor, especially children, throughout the workhouses in Ireland.

The Commissioners were empowered to call and examine witnesses, and to receive documentary and other evidence; and were expected to make their report on or before the 1st February last.

The Workhouse Medical Officers were accordingly invited by your Council to submit any observations they wished to have communicated to these Commissioners; but, having failed to obtain any suggestions from these officers, your Council addressed a letter to the Commissioners expressing their views as follow, viz:—

1st.—That in the event of re-arrangement of dispensary districts, their areas and form might be considered, and that the Dispensary and Registration districts might be made coincident.

2nd.—That more easily available hospital accomodation might be provided for the sick poor, inasmuch as—owing to the great distances at which the existing workhouse hospitals are situated—hospital accomodation is practically unavailable in many instances.

3.—That in the event of abolition of any workhouse, fair compensation, or retiring allowance shall be secured to the Medical Officers whose services may thereupon be dispensed with.

In reply to which your Council received a letter stating that the communication made should receive due attention.

Abuse of Dispensary Medical Relief.

It will be remembered that, in March, 1377, a circular was forwarded to each Dispensary Medical Officer in Ireland, putting queries, and submitting suggestions which were made with a view to check this defect. Over 300 replies were received; and Dr. Speedy (having kindly undertaken the laborious task of examining and tabulating them) submitted a very carefully prepared and lengthy report on the subject to your Council, who were of opinion that a very favourable opportunity then offered of bringing this very important subject under the notice of the Legislature, and the various authorities, by communicating with the Poor-law Union Inquiry Commissioners, then collecting evidence with regard to Poor-law matters; and with this view your Cuncil forwarded the following letter, which they believe

embodies the views of the vast majority of the profession (at least of those who replied to the circular referred to), to the Commissioners, viz. :—

To the Chairman of the Poor-law Union Inquiry Commissioners.

Sir,—The Council of the Irish Medical Association beg to submit the following observations relative to abuse of dispensary medical relief in Ireland, being aware that the Commissioners are anxious to obtain information concerning the present state of medical relief for the sick poor in Ireland, which may tend to make that system more efficient and less liable to be abused than it has hitherto been in many instances :—

When the Medical Charities' Act passed in 1851, the working classes in Ireland were in a very impoverished condition so far as medical relief was concerned, and were dependent upon institutions supported by voluntary contributions. The poor were in the habit of obtaining relief in these institutions by the mere recommendation of subscribers, irrespective of the degree of their poverty. Under these circumstances, on the passing of the Act, it was considered that dispensary medical relief should be easily obtainable, and that the committee of management of the dispensaries should have the power of ordering medical relief equivalent to that possessed by the managers and subscribers under the old voluntary dispensary system.

The state of things which existed at the time of the passing of the Medical Charities' Act has now passed away, and almost all the subscribers and managers of the old voluntary dispensaries have passed away too. The working classes of Ireland are in a much better position than they were at that time ; and the position of the Irish artizan, labourer, or cottier farmer may now be considered as good, relatively, as the position of similar persons in England. Taking the present condition of the working classes in Ireland into consideration, the Council are of opinion that medical relief under the Poor-laws should be administered in Ireland upon similar principals to those acted upon in England, namely—that while every one too poor to pay for medical attendance should be able to obtain efficient attendance easily at the public expense ; yet persons able to contribute towards the expense of medical attendance, either through provident dispensaries or sick clubs, or by direct fees to medical practitioners, should not be permitted to obtain gratuitous advice, except in cases of great emergency.

The Council have taken considerable pains to obtain the opinion of the Dispensary Medical Officers upon this question, and have ascertained that the abuse of dispensary medical relief, chiefly by visiting ("red") tickets is almost universal, and especially great in the South and West of Ireland. They have also ascertained that tickets are so easily obtained that practically there is little difficulty, in the majority of districts, in anyone procuring a ticket. They also find that there is great difficulty in getting improperly issued tickets cancelled by the Committee, partly on account of the *long intervals* between the meetings of the Committee, and partly through the unwillingness of the Members of the Committee to censure their fellow-members by cancelling tickets issued by them. This is, to a certain extent, demonstrated by the small number of cancelled tickets reported to the Local Government Board. The report of the Board shows that the number of tickets cancelled is only about 500 out of a total of nearly three-quarters of a million per annum issued in the whole of Ireland, while the abuse of dispensary relief is notorious in almost every district.

The cancelling of tickets is almost useless, as the patient has had the attendance of the Dispensary Medical Officer, who is responsible for the case, which has generally terminated long before the Dispensary Committee holds a meeting, and tickets are frequently re-issued for the same individual immediately after the previous one had been cancelled ; therefore the Council consider that the following portion of section 9, cap. 68, 14 and 15 Vict., "Provided always that if any person who shall obtain a ticket . . . shall be declared by a majority of the members then present not to be a fit object for dispensary relief, the ticket shall be cancelled, and *the holder thereof disentitled to further relief*," should be read and acted upon in its literal sense.

The Council regret to find, on inquiry that little or but feeble attempts have been made by working people in Ireland to found sick clubs, or provident dispensaries, as in England ; and the Council attribute this want of independence on their part to the fact that so long as free medical attendance is obtainable by almost everyone, as at present, there is no inducement to the people to provide for their own wants out of their own pockets. The inquiries of the Council with regard to gratuitous medical relief in England have proved that wherever free relief is too easily obtainable, either no attempt has been made to establish provident dispensaries, or where such an attempt has been made, it has failed.

The Council also have ascertained that a large number of the Dispensary Medical Officers in Ireland are willing to attend comparatively poor persons at a reduced rate.

The Council are therefore of opinion that, in order to reduce as far as possible the present great abuse of Dispensary Medical Relief, the following rules should be enforced :—

1. That gratuitous medical relief should not be afforded to any person entitled to vote at elections for Members of Parliament.

2. That gratuitous relief should be afforded only to those who are barely able to support themselves and their families during health.

NOTE.—Careful inquiries conducted in England have shown that—

(*a*) Persons in receipt of over £2 a week are able to pay fees for medical advice, and may be left to arrange terms with their medical attendants.

(*b*) Persons receiving at the rate of from £1 to £2 a week are sufficiently well off to provide for their medical attendance by means of provident dispensaries or sick clubs ; as are also single persons in receipt of even less than £1 a week.

3. That persons able to provide for their medical attendance by provident dispensaries or sick clubs should be debarred from receiving gratuitous dispensary medical relief.

NOTE.—The Council consider it the duty of Poor-law Guardians and other local representatives of the people to take the lead in founding provident dispensaries, and even, if necessary, to subscribe funds for initiating such institutions. From the success which has been attained by these institutions in England, and the well-known desire of medical men to help those who are willing to help themselves, there is little, if any, doubt that the services of medical officers (in most cases dispensary medical officers) could easily be obtained for provident dispensaries if established in Ireland.

4. That in cases of emergency medical relief "on loan" from the Poor-law Guardians might be granted to certain persons.

NOTE.—Medical relief on loan is intended by the Council to mean the granting of a ticket for medical attendance in case of emergency to a person who asserts his inability to pay, on condition that he shall, unless he produce proof of his inability to do so, pay to the guardians such fee as the medical attendant would have been entitled to, had the person been attended as a private patient, which fee shall be collected by the guardians for the medical attendant

5. The issuer of the ticket should be held liable for the fee for medical attendance in case he shall have wilfully or negligently issued a ticket to a person not entitled to gratuitous relief ; it being found that the privilege of issuing medical relief tickets is not unusually exercised for the personal benefit of the issuer.

6. A person not entitled to gratuitous relief, who obtains a ticket by misrepresentation, should be punishable for so doing.

7. That power should be given to the issuer of the ticket, or to any Justice of the Peace, to cancel a ticket shown to have been improperly issued or obtained.

8. Wardens, if such officers be necessary, should be ratepayers rated at at least £15, and their appointment should be subject to the sanction of the Local Government Board.

NOTE.—The Council have ascertained that a great deal of the abuse of medical relief is owing to the careless manner in which the wardens frequently exercise their functions ; and the Council are of opinion that in all large towns, and many rural districts, wardens are unnecessary.

9. The existing regulations of the Local Government

Board relative to the issuing of tickets should be strictly enforced, viz., that all the particulars upon the ticket and the signature thereto, should be written by the person entitled to issue the ticket, and not by deputy.

The Council believe that if the foregoing suggestions were carried out, the present abuse of dispensary medical relief would be reduced to a minimum, if not altogether abolished; and they direct the special attention of the Commissioners to clauses 6, 7, 8, and 9, as affording a prospect of immediately checking, to a great extent, the existing abuse.

The Council think that, with the disposition of medical men to accept reduced fees from persons of limited means, together with the establishment of provident societies, and the introduction of the system of relief on loan as a security against emergencies, that no danger need be apprehended that any sick poor person will be unprovided with proper medical attendance, if the foregoing suggestions were adopted.

I have the honour to be, Sir,
Your obedient Servant,
JOHN H. CHAPMAN, Hon. Sec.

ANNUAL REPORT.—*Continued.*

The Factories Bill.

THE attention of the Committee of Council was drawn to this Bill, but as it had already passed the Committee of the House of Commons at the time, the Committee of Council considered that no action on their part, further than that already taken by them in their resolution of 24th July last, would be of any use, and the Hon. Secretary of the "Certifying Factory Surgeons' Association" was informed accordingly; but the Committee of Council are pleased to report that many of the claims put forward by that association were recognised by the House of Commons, and trust that the resolution above referred to tended in some measure to ensure that result, and the thanks of the Certifying Factory Surgeons' Association, for the action taken by this association, have been received.

Members.

Two new members have been added to the list during the past quarter, and one resignation has been received.

Hon. Treasurer's Statement.

The following represents the financial condition of the association on the last day of March, 1878:—

At the beginning of the current year there was a balance in hand amounting to £213 13s. 9d., and since that time I have received £153 6s., making a total of £366 19s. 9d.

From the 1st June to the present a sum of £341 8s. 6d. has been expended.

There remains, therefore, to the credit of the association a balance amounting to £25 11s. 3d.

I have to report that of the large number of subscriptions remaining due at the time of our last quarterly meeting (namely, 655) only 16 have been paid, *i.e.*, 12 for the current year, and 1 for the year immediately preceeding; while for the year commencing on the 1st of June next, 2 subscription have been already paid.

Having regard to the fact that the Committtee of Council have been unremitting in their efforts to promote the interests of the members of the ascociation by every available means, and have devoted a large amount of time and attention to a careful and patient consideration of the various matters brought before them at the ordinary and special meetings, it is much to be regretted that a large number of members throughout the country have failed to respond to repeated applications for the amount of their subscriptions. Thus, for the year ending in May, 1876, there are still 90 subscriptions overdue; for the year ending in May, 1877, 181; and for this present year, 368—making a total of 639 subscribtions, amounting to a sum of £335 19s. 6d. due to the association.

MOUNTMELICK UNION.

FEES FOR EXAMINING LUNATICS.

THE following correspondence was read:—

"To the Local Government Board.

"SIR,—On the 30th April last, I, at the request of two magistrates, examined one Hickey, an alleged dangerous lunatic, and was examined as to the state of his mind. The magistrates adjourned the case for further evidence, and again on the 7th May I attended and was examined. I obtained from the two magistrates an order on the Mountmelick board of guardians for £2. This order I forwarded to the clerk of the union. Again on the 14th May I was requested by the magistrates to examine another man, an alleged lunatic, and was ordered £1 by the magistrates who heard the case. This order I also forwarded to the guardians, and requested payment of it as well as the former. I have now been informed that the Mountmelick board have declined to pay me, they having passed a resolution some time previously not to pay more than £1 in such cases. I now bring the matter before the Local Government Board, hoping they will direct the guardians to pay me the fees ordered by the magistrates.—I am, &c.,

"W. S. SYMES, M.O., Maryboro' Dispensary."

"Local Government Board, Dublin,
14th June, 1878.

"SIR,—The Local Government Board transmit herewith to be laid before the board of guardians of Mountmelick union a letter addressed to them by Dr. Symes relative to a payment of a fee for which he produced a certificate signed by two magistrates; and in reference thereto the board desire to state that they apprehend that the guardians are bound to pay the fee under the 14th sec. of the Lunatic Asylums Act, 38 and 39 Vic., cap. 67, provided the amount does not exceed £2. By order. "B. BANKS, Sec."

The Clerk said there was no doubt that Dr. Symes could recover the full amount if he sued for it, though it was the general opinion of the board that the fee was excessive.

The Chairman said it was clear they could do nothing.

The fee was then passed under protest.

CLOGHER UNION.

DR. PHILIPS'S RESIGNATION.

A LETTER was read from the hon. secretary of the Ballygawley dispensary committee with Dr. Philips's resignation after a service of over thirty years, and recommending the board of guardians to grant Dr. Philips the highest superannuation permitted by the statute. No order was made on the letter. Dr. Robinson was appointed temporary medical officer.

BALLINA UNION.

CERTIFYING LUNATICS.

DR. SCOTT laid before the Board two certificates, signed by two justices, awarding him £1 10s. for examining a dangerous lunatic, and £1 1s. for examining a lunatic residing at Streamstown.

Chairman—The certificates must be returned to the magistrates for them to attach their seals.

Mr. Dillon—There is nothing in the warrant requiring their seals.

Chairman—There is in the Act of Parliament, and it will be in conformity with the practice of the Board. A resolution of this Board requires seals to be attached.

Clerk—On one occasion payment was made without the seals being attached to the certificates.

Dr. Scott—To save further discussion I will have seals attached.

SLIGO UNION.

LEAVE OF ABSENCE TO MEDICAL OFFICERS.

MR. MACGILL moved the following resolution :—

"Resolved—That, in future, every dispensary medical officer should pay his substitute in all cases when leave of absence is required, except when incapacitated by illness contracted in the discharge of his duties. That the practice hitherto, of paying two doctors for doing one man's work is a misapplication of the rates of this Union, and ought to be discontinued. That the Board of Guardians will require the certificate of a duly-qualified medical man as a voucher before such payment be sanctioned."

Chairman—Gentlemen, it is for you to consider whether this resolution should pass. There was a rule made heretofore by the Local Government Board to pay a substitute two guineas per week, but at the meeting of the Dispensary Committee, an objection was made to the practice of paying two doctors at the same time. This objection was withdrawn, so that the Board might have an opportunity of discussing the subject.

Mr. Olpherts said that rule had been made by the Board a long time ago, therefore, if it was intended to change the rule the subject should come before a full Board.

Mr. M. O'Connor said doctors were very hard worked, and had no regular hours to perform that work ; and the Board should not be too hard by refusing them an occasional leave of absence.

After some further conversation,

Mr. MacGill withdrew his resolution, and gave notice of the following motion :—

"I beg to give notice that on this day fortnight I shall move a resolution, asking the Board to discontinue paying the substitutes of dispensary medical officers, except in case of illness caused in the discharge of their duties."

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JUNE 22, 1878.

Thirty deaths from zymotic diseases were registered, being 7 less than in the preceding week, but 4 over the average number for the 25th week of the last ten years ; they include 13 from small-pox, 5 from fever (1 typhus and 4 typhoid), 7 from whooping-cough, 1 each from scarlet fever, dysentery, diarrhœa, &c. The deaths from smalll-pox are 5 under the number in the previous week, and are less than in any week since that ended 11th May. The fresh cases of the disease admitted into hospital number 71, being 26 less than in the preceding week ; 11 patients died during the week, 71 were discharged, and 247 remained under treatment on Saturday last. The Deputy-Registrar of No. 2 North City District, remarks. —"In the lower part of my district, about Abbey Street, Jervis Street, Ormond-market, &c., I have seen more cases of small-pox during past week than for the month previous."

Eight deaths (of children) from convulsions were registered.

Deaths from diseases of the respiratory organs, which had risen from 21 in the week ended 8th inst. to 32 in the following week, have again declined, and number only 17, being somewhat under the average for the corresponding week in the last ten years. They consist of 12 from bronchitis, 3 from pneumonia, and 2 from lung disease unspecified.

THE OTOLOGY OF THE LAST TEN YEARS.

By Dr. Guerder, of Longwy.

Translated from the *Annales des Maladies de l'Oreille, du Larynx et des Organes Connexes.*

By W. DOUGLAS HEMMING, M.R.C.S.

Senior Assistant Surgeon, Central Throat and Ear Hospital.

(*Continued from* Page 510, Vol. xxiii., 1877.)

Part I.—Anatomy and Physiology.

III. *The Middle Ear.*—The recent anatomical investigations which have been made on the cavity of the tympanum have brought to light some interesting details, principally concerning the ossicular chain and the fenestræ rotunda and ovalis. In the same year Rudinger (*a*), Brunner (*b*), Eysell (*c*), and Weber-Liel (*d*) published remarkable works, and all arrived at the same general results, though differing on some points of detail.

The histological study of the ossicles made with or without injection of the parts, gives the following results :—

Three layers of bony substance are distinguishable—the external, compact and covered by periosteum, is very thin, does not possess Haversian canals, and is insensibly connected with the middle layer, which possesses Haversian canals, disposed in a radiating manner ; the internal layer possesses medullary canals, following the shape of the ossicles. In the neighbourhood of the articular surfaces, the external layer becomes much thinned, and one can only see a spongy tissue very rich in Haversian canals. The great vascularity of the ossicles makes them resemble the vertebræ more than the bones of the extremities.

Rudinger describes with much care an inter-articular fibro-cartilage, or meniscus, which exists in the articulation of the incus with the stapes, on the one hand, the malleus on the other. The articular surfaces of the ossicles are encrusted with hyaline cartilage ; they are not in direct contact, but separated by a fibro-cartilage, which, united by its border to the fibrous capsule, divides the articular cavity into two secondary cavities completely distinct. Brunner also admits the existence of this inter-articular fibro-cartilage, only he does not allow that it is inserted into the fibrous capsule, but into the articular surfaces themselves. Instead of presenting a double articular cavity, the union of the ossicles, thanks to the presence of the meniscus, forms, if Brunner's opinion be admitted, a true soldering or symphysis. This point, on which there has been quite a polemical discussion between the two anatomists, is not yet completely elucidated, which is not surprising to those who know the difficulties of the task. It is difficult, from a physiological point of view, to admit Brunner's opinion, and, perhaps, the difference between the two eminent histologists is more apparent than real. We would only remark that Brunner studied the point on the ears of new-born infants, whose articulations may not have acquired their complete development, whilst Rudinger made his researches on the ears of adults between twenty and thirty years of age.

Eysell, after describing with much care the form of the stirrup plate, and of the osseous opening of the fenestra ovalis, gives us a very exact idea of the disposition and of the histology of the ligament which binds this plate to the border of the fenestra.

The fenestra rotunda does not possess well marked borders ; they have a certain thickness (about half a millimetre), which produces an equal space between the mucous membrane of the tympanic cavity and the periosteum of the vestibule. This space is filled by the annular ligament of the base of the stapes, thicker anteriorly and posteriorly, thinner superiorly and inferiorly, so that, on section from behind forwards, it gives the shape of an hour-glass. This shape is due to the fact that the ligament is inserted on a

(*d*) *Die Membrana Tympani Secundaria. M. F. Oh.* 1876. No. 1. *Et Zur Function des Membran, de Ronden Fensters. Centralblatt für Med. Wiss.* 1876.

circumference everywhere slightly curved except at the posterior part, where, the circumference having a plain surface, the ligament presents a rectangular section.

This ligament is composed histologically of short cellular fibres, not interlaced, sprinkled with long and star-shaped nuclei. Rudinger admits the existence of two ligaments, the one vestibular (the stronger), the other tympanic. It remains to be proved what part the periosteum of either side takes in the consolidation of this symphysis.

The base of the stapes not entirely filling the fenestra rotunda, the edge which remains, and which is filled up by the annular ligament, is ·04 of a millimetre. This plate is not in the same plane as the oval opening, and placed in its middle; its centre is carried a little backward.

The base of the stapes on the side of the vestibule is crossed with a cartilage, which constitutes about two-thirds of its thickness. The little canal formed by the edges of the fenestra ovalis is also crossed with cartilage, as has been described by Magnus. This cartilage extends a little way on the inner surface of the vestibule.

Weber-Liel calls this circular ligament of the base of the stapes the *membrana circularis*. This membrane is much larger than appears, the space which remains between the base of the stapes and the circumference of the fenestra; this is well seen in specimens soaked in carmine and dissected. The increase, which is not apparent, but real, accounts for the difference which exists between the shape of the base of the stapes and that of the border of the fenestra. This membrane is susceptible of movements, and in his experiments Weber-Liel has always seen it vibrate more easily than the plate of the stapes; that sounds too feeble to influence that plate caused the membrane to vibrate; he also found that contraction of the stapedius muscle diminished considerably the field of these o cillations.

Weber-Liel has also studied the anatomical dispositions of the fenestra rotunda and the movement of which it is the seat. To see this membrane well it is necessary to raise a part of the walls of the fossa from the fundus of which it is found stretched. We see, then, that it stretches obliquely from above downwards, and from behind forwards. Its insertion is half-a-millimetre further out than it appears, especially at its inferior and posterior part; it is larger than the osseous opening, which it closes, and strongly depressed inwards. It results from this mode of insertion that the field of motion of the membrane may be much greater than is generally supposed, especially in the direction of the tympanic cavity, whilst it is very limited in the direction of the labyrinth. This disposition is of great physiological importance, as we shall see when speaking of the physiology of the entire apparatus of transmission, which merits a chapter to itself.

The structure of the fenestra rotunda according to Weber-Liel, consists of three layers, and not two, as is generally believed. He thinks that the proper layer presents a radiated disposition, though he does not affirm this as certain. From the inferior portion of the membrane arises a fibrous fasciculus which extends to the upper part, which it passes beyond, and divides the membrane into two segments.

The author first described this fasciculus, which he calls the fasciculus of strengthening or tension. The two segments of the membrane are unequal; the anterior occupies about two-thirds, and the posterior one-third of the surface. The form of the membrane is not round, but oval. The greatest diameter measures 2¼ millimetres, and the least 1¼ millimetre.

The differences of authors with respect to the subject of the functions of the internal muscle of the malleus, the observation of certain cases of deafness of an entirely special nature, led Weber-Liel to study this muscle in particular. He has made out its attachments to the tube, and his ideas have been confirmed later on by others (Troltsch, Rudinger, Rebsomen). The conclusion which he has drawn from these investigations have led to very important physiological, pathological, and therapeutical considerations, which we shall examine further on. We shall content ourselves at present with indicating the disposition of this little muscle, as Weber-Liel has described it. "From the posterior part of the cartilage of the Eustachian tube," says the author, "and from the edge of the basilar fibro-cartilage, arises a fasciculus of variable thickness which extends along all the superior and external wall of the tube. At the junction of the cartilaginous portion with the osseous portion of the tube, it unites below with the salpingo-pterygo-staphylinus ligament, and at the sides with the most elevated fibres of the tensor-palati, or peristaphylinus externus. It is in this direction that the tendon of the internal malleus is inserted partly on the bone and partly on the cartilage of the tube, and on the aponeurosis intercrossing with the last fibres of the peristaphylinus externus. From here it is directed obliquely from before backwards, and from within outwards towards the tympanic cavity; the aponeurosis follows it into the osteo-fibrous canal, forming a strong sheath, which accompanies it to its insertion into the neck of the malleus."

(To be continued.)

Clinical Records.

ST. MARY'S HOSPITAL.

Case of Morphia Poisoning Treated with Atropine. —Recovery.

Under the care of Dr. H. SIEVEKING.

(Reported by Mr. S. M. HETHERINGTON.)

R. E., æt. 27, took, with intent to commit suicide, 12 pills, each containing half a grain of hydrochlorate of morphia, at 12 a.m., May 2nd, 1878. At 3 p.m. he was found by his landlady, whom he had desired to call him at that hour, on the floor of his room perfectly insensible. He was immediately brought to St. Mary's Hospital, when his condition was as follows:—

Complete insensibility, pupils extremely contracted, breathing almost suspended, skin cold and clammy, face ashy pale, pulse slow.

The stomach was at once emptied with the stomach pump; mustard sinapisms were applied to the calves, and subcutaneous injection of atropine given, 1-100th gr., which was repeated every half hour. Strong coffee was injected into stomach; cold affusions, galvanism, and vigorous rousings used to restore animation. It was not till 5 p.m., one hour-and-a-half after admission, that any signs of improvement were apparent. The pupils then became less contracted, and the patient's general appearance was better. From this time he continued to improve, but it was with great difficulty that he was prevented from relapsing into his former condition. At 8 p.m. the dose of atropine was increased to 1-80th gr., and given every hour. He was walked up and down the corridor, and strong coffee administered at intervals.

It was noticed that a few minutes after the injection at 10 p.m., he markedly improved, but he soon relapsed into his former sleepy condition. At 11.30 he was sufficiently recovered to give some account of himself. After the fourth increased dose of atropine (12 p.m.) he complained of dryness of tongue and fauces, and had difficulty in swallowing. It was therefore discontinued. Pupils then moderately dilated.

May 3rd.—2 a.m. Resp. 13; pulse 110. Beef jelly and milk given occasionally.

4 a.m.—Able to walk alone; perfectly sensible, and can give a clear history. Was put to bed in a darkened and quiet ward. 10 a.m.—Complains of tongue and throat being very dry, and that he cannot see plainly. Pupils slightly dilated; eyes very red and watery; perspiring freely.

During the day he was kept quiet, light nourishment given, and he appeared to be rapidly getting better. In the evening, however, he complained of strange hallucinations, resembling those of *delirium tremens*. Temperature normal; pulse quiet and regular. He continued restless all night, picking at the bedclothes, and pushing away imaginary objects. Temperature rose in the night to 102·4°.

4th.—Answers questions rationally, but appears strange. Eyes red, still suffering from delusions. Temp. 100°. Has symptoms of congestion of base of right lung; took nourishment well during the day, but got no sleep; towards evening he began to get very delirious. Large doses of chloral were given without effect; temp. again went up to 102°·4.

5th.—Has had no sleep; temp. 103°; continues very delirious. Bromide of potassium, gr. xxx., added to the chloral draught, and two doses of this procured sleep which lasted for several hours, but was disturbed by his cough, which continued to be very troublesome; he was, however, much more rational, and took nourishment well. From this time he continued to improve until he left the hospital on May 14th, perfectly well.

This case presents one or two points of interest. First, the extreme condition of coma that the patient was in when brought to the hospital, and the length of time—one hour and a half—before any signs of improvement were apparent; and secondly the treatment, besides the ordinary means of restoring animation, as cold affusions, galvanism, artificial respiration, &c., subcutaneous injections of atropine were given, with the purpose of counteracting the effects of the morphia. It will be noticed that small doses were given, considering the condition of the patient; this was partly due to a mistake in estimating the strength of the solution, double the dose in each case being intended. The total quantity administered was about $\frac{1}{7}$ gr. The dryness of throat, difficulty in swallowing, and impairment of vision prove, however, that he was well under the influence of this drug, although the pupils were never extremely dilated. I have mentioned in the notes the fact that soon after the injection was administered at 10 p.m., a marked improvement was noticed: the patient was seated in a chair preparatory to the administration of the atropine, and had immediately relapsed into a deep sleep, from which the prick of the needle did not rouse him; but in about two minutes he voluntarily got up and proposed another walk, much to our astonishment, but, unfortunately, soon relapsed into his former condition. This may have been only a coincidence, but I thought it worth recording.

Lastly, with regard to the delirium which followed, and which exactly resembled that from alcoholism, it is worthy of note that poisonous doses of atropine do produce delirium, which is stated to closely resemble that of delirium tremens, and, in support of this, the patient stated that he had been a teetotaller for the last six months, until two days previous to his taking the morphia, and that he did not take much alcoholic beverage then.

Still, the amount of atropine given, and the previous history of the patient, caused us to look upon it as a case of delirium tremens. The congestion of the lungs delayed his recovery, which took place twelve days after admission.

It affords us unqualified pleasure when we hear that the services of members of the profession are appreciated in a substantial manner, and we are glad to place on record two such instances which occurred last week. Dr. Dudfield, the Medical Officer of Health for Kensington, had his salary increased by a unanimous vote of the Vestry from £400 to £500 per annum; and Mr. E. R. Perks, M.R.C.S., of Portsea, received the handsome present of a horse and carriage, costing £200, as a mark of esteem by his patients.

Special Articles.

THE POLLUTION OF RIVERS AND THE NATIONAL WATER SUPPLY.

The pollution of rivers, and its effects upon the fisheries and the supply of water to towns and villages, formed the substance of a discourse delivered on Wednesday last by Mr. Frank Buckland before the members of the Sanitary Institute of Great Britain. The subject must be perfectly familiar to the readers of the Medical Press and Circular, since it has frequently engaged our attention. The prevention of the further pollution of rivers is, it appears, difficult to accomplish. The Government have found it almost impossible to enforce the Act passed a session or two ago, for manufacturers having been long engaged in carrying on large and lucrative trades on the banks of the rivers, believe they have a vested interest in them, and a right to pour their noxious refuse into them. Those interested in various kinds of industry, requiring an outlet for waste products, very properly say, must we close our works and abandon our trade, that you may breed fish, which only supplements the food of the few? This is very well as far as it goes, but there is a question of much more vital importance than the cultivation of fish. It is that of the water supply to the teeming population of this country. This is a matter of so much importance that it will scarcely admit of longer delay before some settlement is arrived at. Mr. Buckland, however, is one of Her Majesty's most active and useful inspectors of salmon fisheries, and he naturally enough looks at the question from his point of view, and discusses the effect of river pollution in its bearing upon the health of his pets. The absence or presence of fish of every kind in a river, may be looked upon, he considers, as an excellent gauge of the quality of the water, and its fitness for human consumption. It is, therefore, of some importance to a population, more so than it at first sight appears to be, and it is quite clear that the pollution of rivers should not be allowed to go on until all the fisheries and salmon producing power of the country are utterly destroyed. The bad smells emitted by the waste products by factories thrown into our rivers, as seriously affects them, as it does individuals, with a sort of typhus fever. They die from the fever and inanition, with mouth and gills widely extended, as if unable to absorb the oxygen of the water.

The fish in the Eden, Esk, and other rivers, all more or less polluted by sewage from neighbouring towns, and receiving the refuse of tanners, mines, paper works, &c., have recently suffered from an alarming outbreak of disease. The fish could scarcely see, and allowed themselves to be quietly and easily netted. On removing them from the water, the mouth and throat were found quite covered with a long filamentous fungoid growth. The blood, which was languidly moving, was perfectly black, and so venous-looking in its character, it was evident that the fish were dying from poison and suffocation.

The epidemic has been of so serious a nature in the Esk, that the watchers have been obliged to remove and bury as many as 200 salmon in a day. The fungus disease early spreads to the smolts (young salmon), trout, eels, lampreys, pike, flounders, and smaller fish, and the fear is that it may become thoroughly established in the district. Now, it cannot be denied that this is a very serious look-out for our fisheries, and we do not wonder that Mr. Buckland should make a great outcry about it, and unless some precautions can be taken to prevent its spread, no English fish will come into our markets, and the price of salmon will be materially increased. A word or two more about the fungus; having had an opportunity of examining many specimens taken from diseased fish, we are in a position to state that it appears to us to belong to the genus *Achlya* (*Saprolegnia* of Kützing), so often found growing parasitically on the bodies of fish kept in aquariums, the mycelium of which is filled with thousands of spores that ripen and develope very rapidly. It is highly probable, also, that the fungus known to pisciculturists as "byssus" is identical with Achlya, or belongs to the same genus. After treating the filaments with a 10 per cent. carbolic acid solution for several days, the spores remained unaffected, and the swarming or rotatory motion within the transparent tube still went on very actively.

To the great accumulation in our rivers of nitrogenous organic matters, albumenoid ammonia, arising from the increase

of the population, and the recklessness with which the sewage is allowed to flow into them, must be attributed the many serious outbreaks of enteric fever amongst those of the inhabitants living on the banks, and who have no other potable water supply to fall back upon. Mr. Buckland, in his round of inspection was quite unable to discover a river free from some kind of abominable pollution. He had, however, a good word for Thirlmere, and which we venture to predict will be reversed or greatly modified, when, at the end of five or six years, Manchester has changed its level, diminished its quantity, and deteriorated its quality. We are not a little surprised to notice that Mr. Buckland reproduces an old fallacy with regard to the presence of "the thousands of animalcules," which, he says, "devour the portions of putrid animal and vegetable matter, and prevent them becoming directly injurious to human health." To the abundance of entomostraca in the Serpentine, and their action as scavengers, he says, "the riders in Rotten row and the drivers in the Park" are saved from a dire calamity, that might arise from the stagnant nature of the water. It will be acknowledged that the presence of thousands of animalcules can only be regarded as a measure of the high state of contamination of any water. These animals must be nourished out of the putrid material alluded to, and their increased numbers evince a dangerous state of pollution from organic products. In short, it should be made more generally known that the multiplied presence of animalcules are not "an admirable provision of Nature for rendering the rain-water butt, the horse pond, and the stagnant pool" yield sweet and wholesome water. Indeed, the lecturer immediately afterwards materially qualified his statement, for, pointing to a pellucid glass of water standing before him, he remarked that, "even in this there may be the latent invisible germs of disease," and, consequently, "the motto of the House of Lords and Commons should be *Sanitas sanitatum omnia sanitas*," and to this we echo a very sincere "amen."

Did space permit we might follow Mr. Buckland throughout, for his lectures must be taken to represent the views of one practically acquainted with the very unsatisfactory nature of the water supply of the kingdom, and which there is no immediate means of improving. But it behoves every one to help Mr. Buckland to agitate and keep the question well before the public.

Special Correspondence.

[From our Special Correspondent].

Paris, Rue du Luxembourg,
July 3rd, 1878.

THE PARIS EXHIBITION.

It is impossible to describe all the subjects interesting in a medical point of view at the Exhibition, or in connection with it, so I must content myself with directing attention to some of the most important groups of exhibits.

ANTHROPOLOGICAL SPECIMENS.

The exhibition of the Anthropological Society in the Trocadéro Park affords an excellent opportunity for the study of craniology, and Dr. Ore's reproductions, by his galvano-plastic process, of human and other brains are well worthy of inspection. *Connoisseurs* in this branch will value them.

Prof. Broça and Dr. Paul Topinard have contributed some very curious and valuable preparations. England is not well represented, though we have in this collection specimens from the Museum of the College of Surgeons, of Mr. John Evans, Mr. Flowers, and Mr. Harrison. Anthropology takes a wide range, and its sections and sub-sections enable it to embrace a vast variety of subjects, so that we have illustrations of the physical characters of different races as regards colour, structure, habits, customs, and language, thus assisting us in tracing our origin to the original pair from whom we are all descended.

The revelations of the geological epochs enable us to connect the links in the chain of evidence on the unity of race, and we have, consequently, a very unique collection of implements, &c., illustrating the polished stone, the glacier, and mammoth periods. The science of vital statistics also enters into the programme, and various statistical maps and tables showing the death-rate, climate of various countries, are on view for the instruction of medical officers of health, who may derive some useful hints, which they may utilise in drawing up their own diagrams and reports. The science of anthropology must be advanced by bringing together, for the instruction of the world, so many valuable and curious illustrations of the workings of Nature.

On looking at the brains preserved by Drs. Ore and Broça, one cannot but recognise the value of having an object before the eye by which the mind, through the eye, may be educated, thus leading to more accurate and scientific investigation, not only of natural but of pathological structures.

PATHOLOGICAL SPECIMENS IN WAX.

Leaving this Exhibition, I next point out the very clever and artistic productions of some of the Parisian artists who assist the study of Nature by their models of various parts of the human body in its natural and diseased condition. Scientifically applied, these models have been, and must be, of great service, and though in England they have been abused by the so-called Drs. Kahns, Jourdans, &c., who used them as a means of frightening nervous, hypochondriacal, and inexperienced young men; still, that does not detract from their artistic merit, or from their practical value to students of medicine. By all means let anatomy be studied from the dead body and morbid appearances from human morbid remains; but in the unavoidable absence of such means of study, I consider imitations, executed with faultless precision, excellent substitutes. Plates are good and necessary, but far better are objects we can handle and take to pieces, like those exhibited by MM. Vasseur, Baretta, and Dr. Auzoux. The diagnosis of diseases of the skin is a source of great difficulty to students, but their study is rendered easy by such models as these exhibited by M. Vasseur, embracing eighty-four specimens, drawn from Nature; schools of medicine might usefully employ these models for instruction.

M. Vasseur's collection is also rich in natural bones. I may point out his artificial collection of vicious pelves, his illustrations of enbryogeny, and his typical collection of syphilitic affections, as being well executed and faithful.

M. Baretta exhibits a valuable collection of illustrations of diseases of the skin and of syphilis, unique in their class, and which are valued at 13,000 francs. These pathological specimens are very artistic and true, but they are certainly dreadful for the general public, and I trust M. Barretta will soon dispose of them for pure scientific purposes, and that they will soon ornament some medical museum. I do not think Frenchmen advertise as they should do, or that they realise the advantages to be derived from judicious announcments in first-class papers of their works.

I believe few in England know where to obtain a *piece* showing anatomy of the brain, eye, ear, arms, pelvis, or what the cost might be, and I fancy if many a general practitioner did know the moderate price of these specimens, their accuracy, and resemblance to natural parts, more would be sold. In the provinces anatomy cannot be practically studied; books are used to refresh the memory and plates to assist by the eye, but immensely superior is a model in which you can remove cutis, muscle, and examine, *in situ*, nerves, veins, arteries, &c., just as at a dissection.

I have never seen in any English journal an advertisement from any firm dealing in these articles of *vertù* (?) and as there are some 18,000 English medicos, I fancy MM. Barretta, Vasseur, Auzoux are neglecting their interests. However, "the cobbler should stick to his last," and these Messieurs know their own business best. I have seen some Venus de Medici at shows, and I often wondered where they came from or who made them. I have found out—having examined the specimens of *anatomie clastique*, displayed by Dr. Auzoux. This name is given from the Greek word, to break, and is meant to express the models take to pieces, showing each part in detail. He has that beautiful anatomical model of a man, priced at 3,000 francs, and a model of a woman in the attitude and size of the Venus de Medici—1,000 francs, with other smaller specimens of this peculiar kind of workmanship. Though much tempted by the novelty of these preparations, I must not linger on them, as there are other objects equally instructive, interesting, and deserving of notice.

SURGICAL INSTRUMENTS.

On examining the surgical instrument department, I found little or nothing new. Great Britain is scarcely represented, and the large London houses do not seem to have considered it worth their while to exhibit. Mayer and Meztler, of Lon-

don, and Gray, of Sheffield, are the only ones I noticed, and even this small contingent do not exhibit anything new, except, perhaps, it be a model showing the application of Sayre's method in Pott's fracture.

English microscopes are shown by Messrs. Ross, Dalmeyer, and other less well known names.

In other classes of English manufactures, in which it may be said medical men have an especial interest, may be mentioned Messrs. Musgrave's, and Messrs. Barnard, Bishop, and Barnard's self-ventilating slow-combustion stoves, which are at once real specimens of artistic design and usefulness. Messrs. Crosse and Blackwell have a splendid case of their extract and other dietetic articles, which have made this house so famous. Messrs. Brand also are represented with their celebrated meat essences for invalids, and Messrs. J. & J. Colman's large case of mustard, corn-flour, starch, &c., will attract the attention of passers by.

The French are represented by MM. Binas (*Instruments*, bandages, &c.), Draper et Fils (*bandages, trusses*, &c.), Guichard (*Bibeeron Gradué*), L. Enausse (*specialities for electro balnéo therapie*), Ferte (*bandages, &c.*), A. Vigè (*ditto*) Milliany (*orthopædic instruments*), Vergne and Cnose (*surgical instruments*), Biondetti (*orthopædic instruments*).

The specimens of artificial eyes displayed by MM. Boissoneau and Liskenne are very good.

I do not thing the jury will have much difficulty in adjudicating in this division.

THE JURY.

I may mention the names of the jury in class XIV., embracing "*Medicine, Hygiene, et Assistance Publique.*" *England:* Professor Lister. *United States:* Dr. Thomas W. Evans. *Italy:* Dr. Bertini, Deputy. *Switzerland:* Prof. Vogt, of Bonn. *Belgium:* Prof. Hairion. *France:* Profs. Beclard, Le Fort, Trelat, and Vulpian. Substitutes: Prof. Richet and M. Theophille Roussel, Deputy.

THE PAVILIONS OF THE VILLE DE PARIS.

The general administration of the Paris hospitals—the *Assistance Publique*—has two pavilions full of interesting specimens illustrating its management and its history. Hospital reformers and sanitarians will here find ample employment in examining the *fac-simile* of the wards of a Paris hospital, the model of Tarnier's lying-in pavilion, and the plans of the New Hôpital de Menilmontant and the Maritime Hospital of Berck-sur-mer. Here are to be found some antiquities connected with one of the most famous Paris hospitals—the Hôtel Dieu; old documents, manuscripts, account and budget books, pictures of the hospital as it was and as it is, and the instruments of the eminent surgeon Dupuytren, whose fame is associated with the Hôtel Dieu. Though the visitor may here form a correct idea of a Paris hospital ward from the typical reproduction of it down to the most minute detail, I think it would be better for him to visit an hospital during the time of actual work. The model of Tarnier's Lying-in Pavalion seems well contrived to prevent contamination and the ill-effects arising from having a number of women confined at the same time in the same room. His plans are simple, and if efficiently and practically carried out, cannot fail to diminish the risks of puerperal septicæmia. Sanitarians and philanthropists will find much to study and interest them in the special Pavilions of La Ville de Paris. The various "directions" constituting her administration, and by means of which the city is ornamented and hygienised are represented, and under this head we have fine arts, architecture, the water supply, the sewers of Paris, police supervision, education, charities, &c. I need not dwell on the various objects of art, &c., on view in this department, but as the subject of sewerage and water-supply is of such great practical importance, I must direct attention to the models of the sewers of Paris. The Paris sewers are a curiosity for their architectural arrangements, and should be visited; but here may be seen models of the trucks, vans, railway-cars, and boats which are used for floating on the sewer-waters, and the contrivances for collecting the sewerage, and for visiting, repairing, or cleansing the pipes. The results of the utilisation of the sewage may be seen on the gallery running round the Pavilion from the well-known sewage works and farm of Gennevilliers, and from the specimens it can be seen how barren land may be reclaimed and brought to a high state of cultivation. The special exhibition of the Ville de Paris must be seen to be appreciated, but I must not linger any longer on it as there are some other parts of the general Exhibition I must yet notice.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
Is published every Wednesday morning. Price 5d. Post free,

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.
A. H. JACOB, 3 Molesworth Street, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Ru Hautefeuille, Paris—post free in advance, £1 3s. 6d. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, six and a-half dollars (£1 3s. 6d.) per annum; or direct from the Offices in this country for the same amount, if remitted by International Post-office Order.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 10, 1878.

RE-CONSTITUTION OF THE MEDICAL COUNCIL.

IN our last issue we made the following remarks:—"It has been said by a leading contemporary that it is hopeless to expect that the Medical Council will take any steps towards reforming itself, or that it will even give any advice to the Government on the subject. We give the Council more credit for its disinterestedness and its desire to comply with the wishes of the profession." We further stated that the Council will be found to "favour direct representation as soon as the desired reconstruction becomes practicable." It is, therefore, with great pleasure we see that the confidence we had in the good intentions of the Council has not been misplaced. Nearly the whole of last Wednesday's meeting of the Council was taken up with a discussion of the question of its own reconstruction. Dr. Pyle gave the signal for the debate when he proposed the very meagre measure of reform implied in the resolution: "That as a mode of granting a larger representation of the profession in the General Medical Council, every graduate of a university, or licentiate or member of any corporation, shall have the privilege of voting for the representation of the university or corporation of which he is a graduate, member, or licentiate." As Sir William Gull afterwards remarked, this motion had nothing to do with the Council, but with the corporations and universities, and therefore it was not to be surprised at that such a motion found little favour with the Council, and was subsequently withdrawn. Mr. Simon then moved the following amendment:—

"That it be respectfully submitted to the Lord Presi-

dent, as the opinion of this Council, that in the event of the Medical Bill becoming law in the present session of Parliament, it will be desirable that, as soon as then may be, the question of the constitution of this Council be thoroughly considered by Her Majesty's Government with reference to the new state of the law, and particularly with the object of determining what (if any) changes of constitution the Council will require, in order that it may possess the best qualifications which can be got for the duties which it will then have to discharge."

It will be seen that this amendment threw the whole onus of reforming the constitution of the Council on the Government; and had, moreover, such an amendment been carried, it might be doubtful whether the consideration of the subject would not be held over for years to come. When once the Duke of Richmond's Bill became law, immeasurable difficulties would be thrown in the way of direct representation, if the consideration of the subject rested entirely with the Government. But, as Sir W. Gull very justly remarked, the Council was able to reform itself, as the House of Commons had done, and should not wait for the machinery of a Royal Commission or a select committee. He, therefore, proposed the following resolution:—"That the constitution of this Council needs revision; and that the Council do affirm that it is desirable that at its first meeting after the present session of Parliament, it should consider what modifications of its constitution are demanded, and are required, and should report to the Government accordingly." Doubtless to the great surprise of those whose intemperate zeal in favour of the immediate reorganisation of the Council has led them to think that the Council would not itself take the subject under their consideration at all, Sir William Gull's motion was, with a little alteration, almost unanimously agreed to. Sir James Paget suggested that after the word "affirm," the motion should read, "and represent to the Government that at its first meeting," &c. Sir W. Gull accepted the alteration, and on being put to the vote, the motion as altered was carried, 18 members voting for it, and no hands being held up against it. Moreover, at the sitting of the Council on Thursday, it was, on the motion of Mr. Simon, referred to the executive committee to prepare a report, to be presented at the next meeting, on the constitution of the Council, and on any change which might be desirable to promote the efficient discharge of its duties. It is therefore to be hoped that those who have been so strenuously promoting the Bill for direct representation will not continue to obstruct the progress of the Government Bill, provided the latter in other respects accords with the wishes of the medical profession. We have, all along, maintained the inexpediency of any such obstruction, and therefore approve of Dr. Humphry's motion, which was seconded by Sir W. Gull, and carried by a majority of 11 to 4:—"That the Council is of opinion that the consideration of the question of the revision of the Council should not prevent the passing of the Government Bill now before Parliament, with such alterations as the Council has suggested."

Altogether, it cannot be said that the recent deliberations of the Council have been barren of results. It is true that two or three days were spent in discussing the merits, or rather the demerits, of Lord Ripon's amendment. But the question was a very important one, and one in which both the corporation and the profession showed themselves to be deeply concerned.

An important resolution was moved by Dr. Rolleston on Tuesday, to the effect that "Any woman who shall have passed the examinations of the Conjoint Board shall have the right to obtain a diploma of any one or more of the co-operating corporations." This was undoubtedly a wise concession on the part of the corporations, inasmuch as it will cut the ground from under Lord Ripon's amendment, which was made with the express purpose of enabling women to get qualified, independently of any connection with the corporations. Besides, the concession after all was but a foregone conclusion. The free admissions of women into the ranks of the profession, and their participation in all the privileges attached to male practitioners of medicine, have now gone too far to admit of any further obstruction being thrown in their way, even were it desirable.

SUPERANNUATION OF IRISH POOR-LAW MEDICAL OFFICERS.

We observe that Mr. Patrick Martin, M.P., has given notice of his intention to move for returns "of the number of Poor-law officers in Ireland who have resigned since the passing of the Union Officers' Superannuation Act, and at the time of resignation were entitled to superannuation, and stating the length of service, age, and number of officers in each year who were not granted the full two-thirds of their salary and emoluments by the Poor-law Guardians, and the amount of salary and emoluments and sums paid by way of superannuation, and the cause why the full two-thirds was not granted."

We are unaware of Mr. Martin's object in asking for these returns, but the hon. member will do good service by opening up discussion upon the question of superannuation, especially with regard to medical officers. The existing system is eminently unsatisfactory, because it makes the guardians the judges both as to the fitness of superannuation and as to the amount of the pension, and because—as a general rule—Boards of Guardians are altogether unfitted to exercise such a discretion. We are justified in assuring Mr. Martin that under the present system the old, worn-out, decrepit, and overworked medical officer is the last person who could venture to resign his office with a view to seeking a pension, because, being professionally and socially effete, he is not able to keep in close personal friendship with individual guardians, and probably has neither the money nor the taste for keeping up the hospitalities which are needful to maintain these personal friendships. But we need hardly remind those who know the Irish Poor-law service that every other consideration gives way to personal feeling and religious views, and that long service, conscientious work, and real incapacity for duty are matters altogether secondary in importance in the mind of the average Poor-law guardian. Thus it happens that the jovial, middle-aged, robust doctor, who drives a nice "trap," gives a toothsome dinner, and studiously avoids interfering with the private interests, personal feelings, or religious views of the guardians, is usually certain to obtain a full two-thirds

superannuation whenever a smart temporary indisposition affords a pretext for granting it; but if he remain in harness until his social qualities are lost—if he be over-zealous, hyper-conscientious, too outspoken, or too hard up, he will probably be obliged to remain in office until superannuated by death, though for perhaps the fifteen last years of his professional life he may be hopelessly incapable of doing justice to the sick poor.

This picture is—we are conscious—complimentary neither to the guardians, to the medical officers who have obtained superannuation, or those who have failed to do so. We do not suggest that long, good, and conscientious service, and real incapacity for duty, are without weight in the matter; nor do we infer that superannuation is granted universally or solely on the principle of private favour; but truth obliges us to say that that principle is the ruling power, and that it must continue to be so as long as Poor-law guardians are intrusted with the absolute discretion of refusing or granting a pension.

There ought to be one, and one only, reason for granting a superannuation—*i.e.*, the permanent incapacity of the medical officer to do *full* professional justice to the sick poor. Length of service is proper for consideration in fixing the amount of a pension; the financial circumstances of the doctor may also be considered in the same connection; but permanent incapacity is the only justifiable ground for awarding a pension.

Respecting such incapacity, the views of Poor-law guardians are subject to remarkable diversity. One medical officer is held to be hopelessly incapable, if at fifty years of age he has had a liver attack, or a bad fever; his neighbour, at eighty, is supposed to be perfectly able for his work, though half blind, altogether decrepit, and far advanced in second childhood. An officer may be quite capable for workhouse duty, at the same time perfectly unfit for dispensary night-work, and yet he fears to resign the dispensary, lest he may lose both office and pension. The only evidence of incapacity and of its permanency, upon which the guardians can act, consists in certificates granted by the doctor's friends upon his *ex parte* statement, and upon a cursory examination of his case; and such certificates must always be unreliable, especially as they do not take cognisance of the most usual and worst cause of incapacity—*i.e.*, deterioration of intellect by old age.

We assert—upon all these premises—emphatically and without hesitation, that a board of Poor-law guardians is the worst tribunal to which the superannuation of a medical officer could be confided. To entrust such a power to them is to encourage popularity-hunting in the doctor, and to discourage honest conscientious performance of duty; and it is likely to end in the unnecessary burthening of the rates with pensions, or in the infliction upon the sick poor of a thoroughly incapable medical officer.

We cannot illustrate the plan by which the system could be reformed more perfectly than by quoting from the letter of "A Poor-law Medical Officer," which appeared in our issue of May 22 last. Our correspondent says:—

"In the interests of the sick poor, whose requirements ought not to be overlooked, and at the same time in justice to one or two classes of the Poor-law medical officers, I am of opinion the authorities might be induced to action; viz., *first*, where a medical officer has, from arduous duties and long services, say twenty years, and sixty years of age, or nearly so, and whose health, mental or bodily, does not admit the due discharge of the duties devolving on him, that he shall be submitted to a careful examination by a medical board (nominated by the Local Government Board), consisting of three or four medical men of standing in their profession, presided over by the medical commissioner, this board to meet once a quarter to hear and decide on such cases as may be presented; their decision to be a guide to action on the part of the Local Government Board. *Secondly*, that numerically small class of medical officers who have been twenty-five years in office, and attained the age of seventy years, they shall be declared physically incapable of discharging their duties, and be called on to resign their appointments; that those two classes when disqualified, should receive two-thirds of their present emoluments, one-half thereof to be paid out of the union rates, the other half out of the Consolidated Fund, or from a source which without prejudice to any interests might be made available to this small extent—viz., the surplus funds of the disestablished Irish Church."

The propositions herein contained are sensible and practical, and might be carried into effect to-morrow with great advantage to all concerned if the objection to taxing local rates without the control of the Guardians were once got over. We are aware that representative control in such matters is one of the accepted political dogmas, but we are commonplace enough to assert that in this and in other matters connected with Poor-law administration that control has produced, and can produce, nothing but mischief.

The only superannuation tribunal in which any Irishman can have confidence is the Local Government Board, and the function of that Board should be confined to ascertaining by a medical committee who are totally independent of the medical officer, whether that officer is really permanently incapable, in which case there is the greatest public necessity for relieving the sick-poor of his ministrations.

Of the present system, the best that can be said is, that it is better than none. It enables a conscientious Board of Guardians to grant a fair pension to a permanently incapable officer, but—so far from assuring that they shall do so—it directly invites the medical officer to secure a pleasant retirement at an early age by manipulating a majority of his Board. The prize of a pension may, under the existing system, fall to the best diplomatist and not at all to the most deserving officer, and all the world knows, that in the nature of things, it must continue so to fall until *permissive* superannuation gives place to superannuation of *right* under proper departmental supervision.

TREATMENT OF ACUTE RHEUMATISM.

At the March meeting of the Glasgow Medico-Chirurgical Society, there was a long discussion on the treatment of acute rheumatism, which, to our minds, shows what little positive knowledge we have with regard to the best treatment of this disease. Dr. Charteris initiated the discussion by mentioning some of the various modes of treatment which had been tried, such as venesection,

the perchloride of mercury, tartar emetic, blistering, alkalies, the expectant treatment, and lastly, the use of salicin and salicylic acid. He spoke favourably of the salicin treatment, and observed that both the Scottish and German physicians had found that relief from pain was usually got in from 24 to 48 hours, that heart complications were not averted, save indirectly by the arrest of the disease; and that in very acute cases, with hyperpyrexia, cold baths must supplement the other treatment. Dr. M'Call Anderson said that we should look to the causes which gave rise to it, which were chiefly exposure to cold, or derangement of the digestive organs. As to salicin, it was on the whole, the best internal medicine for the ordinary run of cases; but it was not a specific, and there were not a few cases which did not give way to it. High temperature was the great source of danger in these cases, and should be guarded against. Mr. John Reid remarked that he had found blood-letting to give almost immediate relief; and that not only had he bled, but he had brought patients under the influence of mercury. This treatment, followed by blistering in the event of any local affection continuing, has never failed to produce a cure. Dr. Hugh Thomson also said that if bleeding were not now out of fashion, he would be inclined to adopt Bouillaud's method of treatment. It was surprising, he observed, how rapidly it brought the patient into a state of complete apyrexia. Dr. Gairdner said that no confidence was to be placed in small doses of salicin—in doses less than 20 grs., and that the effect of that drug was not dependent upon its anti-pyretic effects. Dr. Renfrew had long rested in the belief that six weeks in the blankets was the only treatment; but he happened to try nitrate of potash, and with much success. With even more confidence did Dr. Scott Orr speak in favour of the acetate of potash, which on the whole he would prefer to salicin.

The various changes that have taken place in the treatment of acute rheumatism, are by no means creditable to modern physic. The English-foreign bibliography of this one disease is something astounding, and yet we know little more about its appropriate treatment than Aretæus and his contemporaries probably knew. The retrospect of treatment taken by Dr. Charteris, was far from exhausting the list of remedies that have been recommended for acute rheumatism. To those above mentioned we might add purgatives, emetics, diaphoretics, opium, and other narcotics, calomel and opium, colchicum, aconite, Peruvian bark, phosphate of ammonia, phosphorus, and sulphur, all of which have been severally extolled as valuable remedies for this diease. In the discussion to which we are now referring, Dr. Morton said that the reason so many remedies had been vaunted in acute rheumatism, was probably that it was not a disease difficult to treat, by which we suppose he meant that the disease generally terminated favourably, no matter what treatment was pursued. We do not think he is far wrong in saying this much, for it is more difficult to guage the efficacy of certain drugs in a disease from which recovery generally takes place, than in one that is almost invariably fatal. At all events, it is for the credit of scientific medicine, high time that some consensus of opinion should be arrived at with regard to the best possible treatment of a disease of so common occurrence as acute rheumatism. In our endeavour to gain a more positive knowledge of its treatment, we ought, perhaps, first to study more systematically the natural history of the disease, and try to find out the conditions under which the disease is either prolonged, or terminates fatally. Having arrived at a more positive knowledge of the average duration of the complaint, and of the symptoms by which a severe and prolonged attack of it may be surely prognosticated, we should thus be in a better position to judge of the relative efficacy of the many drugs or plans of treatment that have been recommended. It might then be soon determined whether salicin is superior to other medicines, such as quinine or Peruvian bark, for which it was used as a substitute 30 or 40 years ago; under what pathological conditions hyperyxia occurs; and what drugs are best calculated to prevent or mitigate so dangerous a symptom.

Notes on Current Topics.

Swimming for Girls.

In a morning paper Mr. John Macgregor says that "hundreds of girls in London are learning to swim, but many hundreds more would gladly learn if teachers could be had." With regard to the great saving of human life that would result from our daughters learning to swim, as well as our sons, it is not within the province of a medical journalist to say much on the subject. But there is one aspect of the question on which he is entitled to give an opinion, and that is, the effect such a practice would have upon the health of women, particularly at that period of life when the human frame has not completed its full development. The advertisements in the newspapers are continually reminding the public of the numerous contrivances, supports, stays, shoulder-straps, &c., and the various exercises, that are best calculated to prevent round shoulders, a stooping awkward gait, contracted chests, and so forth; but, perhaps, there is no kind of exercise for girls more calculated to attain those desirable objects than that of swimming. During the act of swimming the head is thrown back, and the chest well forward, while the thoracic and respiratory muscles are in strong action, and both the upper and lower extremities are brought into full play. Indeed, in a health point of view, females would often have an advantage over the stronger sex, as, owing to the large amount of adipose tissue covering their muscles, and the comparative smallness and lightness of their bones, they not only have greater powers of flotation than men, but, as a rule, can continue much longer in the water. They are, therefore, naturally qualified to become good swimmers; and Mr. Macgregor mentions that out of a class of thirty girls, whose instruction commenced late last season, twenty-five were taught to swim in six lessons, and six of them won prizes. It is to be hoped, therefore, that girls will not be debarred from learning this graceful and healthful accomplishment, either through lack of baths or of teachers. Such a practice is particularly called for at the present day as a set-off against the growing tendency in the "girls of the period" to indulge in

those literary and sedentary pursuits which are anything but favourable to the development of a healthy physique.

Shocking Death from Hydrophobia.

On Thursday last an inquest was held at Acton, in Middlesex, by Dr. Diplock, coroner, touching the death of George Kirby, aged 14. The evidence given went to show that, a month ago the deceased was playing with a Scotch terrier, when the animal bit him, or rather scratched his hand with his teeth. The abrasion did not heal, but no notice was taken of it until a few days ago, when the deceased complained of illness, and upon Dr. Harding being summoned, he pronounced the case to be one of hydrophobia. Convulsions came on of such a violent character that two powerful men had the greatest difficulty in holding him, and all attempts to administer chloroform were abortive. His agonies increased, and after three days suffering he died. Dr. Harding said that before death the veins of the arm bitten by the dog stood out prominently, the eyes were contracted, and the deceased was unable to swallow. A *post-mortem* showed the heart to be empty, lungs and kidneys congested, stomach empty, with dark patches on the peritoneum. The brain had not been examined. Death undoubtedly arose from hydrophobia. Mary Haynes stated that she had been bitten by the same dog, but had as yet had no symptoms of hydrophobia. In reply to a juror, it was elicited that the dog had been examined by a veterinary surgeon, who had pronounced it to be perfectly healthy, and it had therefore not been destroyed. The juror expressed his opinion that it should be killed forthwith, but the coroner had no power to order its destruction. A verdict of "Death from Hydrophobia," was recorded.

We print this case as detailed in the *Daily News*, and as a typical example of the manner in which such cases are reported. We have the unwise use of the adjective "shocking." We have a few brief facts, and very imperfect evidence as to cause and effect, and the usual stereotyped verdict of the coroner's jury, "Death from Hydrophobia." This paragraph will no doubt be circulated through every part of England, copied from journal to journal, and by printers' blunders names will be altered, so that probably it will do duty for six or a dozen cases, as others have previously.

This unfortunate heading will alarm nervous people, and probably many days, weeks, or even months of anxiety will be passed by persons who have been bitten and who have read this description. The evidence as to the real nature of the disease is, that rabies cannot arise or develop unless from the bite of a rabid animal. The dog which bit the boy is reported to be alive and well. Convulsive diseases of children are common during periods of weather such as we have had lately, and we have here a possible source of error. We are astonished to read that though a *post-mortem* examination was made the brain had not been examined. Dr. Harding, who is said to have attended the case (if *this report* be *true*), omitted the most important part of the examination, and we must consequently regard the *post-mortem* evidence as defective and, to a certain extent, valueless. On the facts we have at present we can only say that this case is unsatisfactory. We must impress upon every practitioner that the responsibility which rests upon them necessitates the greatest carefulness in pronouncing on a case of hydrophobia. The only real and efficient safeguard to prevent mistakes is, the appointment of the medical inspectors in accordance with the plan we suggested in our Reports, and we trust that some Member of the House, as Mr. Bennet Stanford who has offered the £100 prize, may think it worthy of the attention of Government and bring it under notice.

Habitual Drunkards' Bill.

The Medical Press and Circular was one of the first organs of medical opinion to support this Bill, and therefore we are glad to see that last Wednesday evening the Bill was read a second time in the House of Commons. In two or three leading articles that appeared in this journal, more than twelve months ago, we entered fully into the reasons for the Government recoguising the necessity of placing more restraint upon habitual drunkards than has been hitherto practicable, There is, however, this great difference between the present Bill and that to which we formerly drew attention, that whereas some of the provisions of the old Bill were of a compulsory nature, the present Bill is only a permissive one. Although it was designed in the original Bill that the friends or relatives of habitual drunkards should be enabled to bring them before petty sessions, to get a committal to one of the proposed asylums, Dr. Cameron was willing to abandon these compulsory clauses if Government would only agree to adopt the permissive power. The object, therefore, of the present Bill will be to license, inspect, and control retreats for habitual drunkards, giving their managers some power, in case of persons entering voluntarily, to detain them for such time as is necessary for their proper treatment. Owing to the omission of the compulsory clauses and the urgent need of some legislation on the subject, the Bill was warmly supported by the House, several members speaking in its favour. The withdrawal, however, of the compulsory clauses, although the best policy which could be adopted under the circumstances, prevents the Bill reaching a class of cases over which some legislative control is certainly desirable, and which were provided for in the original Bill. It would not, for instauce, meet the case of habitual drunkards in the lower ranks of life, who would not be able to pay for their maintenance in private retreats. Nor will it meet the case of those ladies and gentlemen who, although killing themselves as fast as they can, and who are a disgraceful source of misery to their dearest relatives, cannot be persuaded to enter an inebriate asylum. With this exception, the Bill will prove a great boon in the interests of public morality. It is the thin edge of the wedge in, and will prepare the way for further legislation on the subject, in the event of the present Act not being sufficient to fulfil the objects for which it was passed.

We understand that Her Royal Highness the Princess Christian has accepted the presidency of the ladies' committee of the Hospital for Women, Soho Square, London. H.R.H. has already shown her interest in the instituton by giving her name for several years past as patroness.

A Dangerous Assistant.

On Friday last a medical assistant, named Thomas Humphrey Cooth, was charged at the Marlborough Police Court with being drunk and assaulting his employer, Dr. E. J. Nix, of Upper Marylebone Street, London. Prosecutor stated that on his return from visiting his patients on Wednesday his page told him that the prisoner had gone out and would return in a few minutes. The prisoner, however, did not return till Thursday morning, when he walked into the surgery. Observing that the prisoner was not sober, he told him he would pay him the balance of his salary, and that he would have to leave in a month. In the afternoon, the prisoner having been again out, he told him that such conduct would not answer, and that he would have to leave at once, as he was in a state of intoxication, and that he could not think of allowing any one to put up his medicines in such a state. The prisoner said he *would* dispense the medicines, got very excited, struck Dr. Nix, and rushed at him with a knife, upon which he left the surgery, closing the door, and went for the police.

The prisoner, who said he had never been drunk before, was prepared to apologise for his conduct. Police-constable H. Head, 96 E, said that he found the prisoner in a very excited state, and on the way to the station he took a bottle of poison from his pocket and threw it into the road, stating that he might otherwise have taken it when he got to the station.

Mr. Newton asked whether the prisoner said anything when he was charged with taking up a knife?

The Constable said the prisoner went down on his knees and said he never intended to use it.

Dr. Nix said the prisoner had only been a month in his employ, and that he received an excellent character with him.

Mr. Newton ordered the prisoner to find one surety in £10 for three months.

Such is another of the many sad instances on daily record of educated men giving way to drink. Fortunately, no serious harm resulted; but for the promptness of Dr. Nix in rushing out of harm's way, the prisoner might now be incarcerated on a charge of murder. We hope his escape will be a lesson to him.

Diarrhœa and the Escape of Sewer Gas.

In the *Practitioner* for June there is a communication from Dr. Wm. Newman, which shows that diarrhœa is a disease which is sometimes clearly traceable to bad sanitary arrangements. The cases of diarrhœa were of the simplest nature, uncomplicated, and unattended with any serious disturbance of the health. But the most significant fact was that the patients on the men's side of the house alone suffered from the disease; not any one on the women's side was in any way troubled. A careful inquiry was set on foot to make out the causes of the outbreak, and, to omit further particulars, the chain of events appears to have been as follows:—1. Retention of a large quantity of fæcal decomposing matters in that portion of the sewer just outside the wall of the building. 2. Return of sewer gas into the building, and especially into the end wards on the men's side. 3. Occurrence of diarrhœa in every patient who was placed in either of the wards in question during a certain time, or who, sleeping in the middle ward, made use of the ill-acting closets. 4. Immediate subsidence of diarrhœa on the due repair of the sewer.

Specific Remedies.

In *New Remedies* for June will be found the following formulæ, which were no doubt prescribed on the principle that, although too many cooks may spoil the broth, too many ingredients do not:—

1. *Lallemand's Gout Specific.*—Extract. colchici acet. et opii aquos. āā gr. xv.; Potassii iodidi., ʒiv.; P. acetat., ʒj.; Aq. destil. fl., ʒiiis.; Vini. albi. fl., ʒiv. "Twenty drops three times a day."

2. *Brown-Séquard's* (?) *Neuralgic Pills.*—Ext. hyoscyami. et conii. āā gr. 40.; Ext. ignatiæ amar. et opii āā gr. 30; Ext. aconiti, gr. 7½; Cannab. ind., gr. 15; Stramonii, gr. 12; Belladonnæ, gr. 10. Make sixty pills. There are also Gross's Neuralgia Pills, which are composed evidently on the idea that if one ingredient does no good the other may. They contain quinine, morphia, strychnia, arsenic, and aconite.

The Royal College of Physicians of London.

On Wednesday last the annual conversazione was held at the College of Physicians. The entertainment was in every way as instructive and gratifying as on former occasions. The assembly was, perhaps, as numerous as ever, though not honoured by personages of Royal rank, as last year.

Numerous paintings were lent for exhibition, and among them one, "Evening in the Moon," which, at the present time, seems to be exciting some attention. It represents the moon at the time of sunset. The spectator is supposed to be standing upon a mountain peak in the moon; to his right falls the dazzling light of the setting sun upon some of the mountain tops—a light unbroken by the penetration of an atmosphere. In front is the earth, a light giver to the moon—and a part of the milky way is also seen. It suggests itself to us that, as there is no atmosphere around the moon—a fact evidently well known to the artist, the milky way should appear, not as a diffused opacity, but rather as a multitude of small bodies. The picture gives rise to much thought, and is extremely interesting as a realisation of ideas.

The phonograph was exhibited by the London Stereoscopic Company, and attracted many of the visitors. For the first time the instrument was made to develope the two voices in a duet. The instrument was explained a great many times, and numerous questions were put to the exhibitor, some of which were rather curious. One elderly gentleman, not unintelligent, innocently expressed a very earnest desire that it might be more fully explained to him how the voice was retained within the cylinder (a revolving drum which supports the foil).

The microphone was in action, but the surrounding noises were too numerous for it. A micro-spectroscope showed the absorption spectrum of poisoned water from Lake Alexandrina, South Australia. Cattle die from drinking the water of this lake, though the poison is not yet known.

Many new scientific and clinical instruments, with their latest improvements were to be seen, and many hours

might have been spent in improving even a well-stored mind.

Elections to Council of Royal College of Surgeons of England.

More than usual interest was manifested in the elections this year, on account of the number of candidates for the vacant chair. As we mentioned in our last, three members retired by rotation, viz., Messrs. Erasmus Wilson, Henry Lee, and Barnard Holt, who, being eligible, offered themselves for re-election. In addition to these, Sir Henry Thompson, and Messrs. John Gay, Lister, Thos. Bryant, John Wood, and Hy. Power, all metropolitan fellows, and Mr. Edward Lund, of Manchester, sought the suffrages of the electors. At 5 p.m., when the poll was declared closed, the President, Mr. Birkett, amid considerable excitement, announced the following result:—Mr. Lund, 101 votes; Mr. Wilson, 95; Mr. Gay, 92. Thus the provincial candidate came in at the head of the poll, and the only retiring member re-elected was Professor Wilson, the two others, Messrs. Lee and Holt, being at the bottom of the poll. The third member elected, Mr. Gay, has before served, and was defeated at the last election by one vote only. Of the unsuccessful candidates Mr. Wood received 81 votes, Mr. Power 78, Mr. Lister 76, Mr. Bryant 62, Sir H. Thompson 58, Mr. Lee 38, and Mr. Holt 37. Four votes were informal. The result of the election has surprised not a few, and various conjectures have been indulged in to explain the extraordinary success of the provincial candidate, and the few votes recorded for the two retiring members of the Council, both of whom have the credit of being popular men. Such, however, are the results, which we leave to imaginative minds to work out according to their fancies or desires.

The rates of mortality in the principal foreign cities, according to the most recent weekly returns, were—in Calcutta 38, Madras 37; Paris 23; Geneva 23; Brussels 22; Amsterdam 27, The Hague 27; Copenhagen 20; Stockholm 24; St. Petersburg 45; Berlin 34, Hamburg 27, Dresden 24, Breslau 28, Munich 38; Vienna 33, Buda-Pesth 46; Rome 27, Turin 28, Venice 23; Alexandria 36, and New York 22 per 1,000 of the population.

The deaths from small-pox, both in London and Dublin, were considerably higher than in the previous week, being 39 in the former, and 27 in the latter. No death was reported from this disease in any other part of the kingdom. The deaths from diarrhœa rose somewhat throughout the kingdom last week, owing to the extreme rise of temperature, they were principally amongst infants.

On Saturday morning the Chancellor of the Exchequer, in walking from one of the rooms of his official residence in Downing Street into the garden struck his head against the sash of the window, and inflicted a wound on the forehead. The wound, which bled freely for a time, was found not to be a dangerous one. Sir Stafford is going on well, but has been ordered by his surgeons to be quiet for two or three days as a matter of precaution.

A valuable appointment for pathologists will shortly become vacant, by the resignation of the office of Professor Superintendent of the Brown Animal Sanitary Institution, by Dr. Burdon Sanderson. This institution is under the government of the University of London, and although the stipend attached is not great, the field it offers for experimental research is unequalled in the United Kingdom.

At the Chelmsford assizes, on Saturday, the grand jury brought in a true bill against the manufacturer of the violet powder which it is alleged has caused the death of several children on whose bodies it had been used. Analytical chemists have reported the presence of over 50 per cent. of white arsenic in the packets examined. The trial will be proceeded with this week.

The rates of mortality in the four principal cities of the United Kingdom last week were—20 per 1,000 in London, 27 in Glasgow, and 30 in Dublin. Sunderland again showed the highest death-rate in the kingdom, namely, 32 per 1,000. Plymouth gave the most favourable returns of the other large towns, with 12 per 1,000.

The receipts at the concert recently given by Madame Trebelli in aid of the Hospital for Diseases of the Throat and Chest (Golden Square, W.), amounted to £550, including special contributions from Madame Adelina Patti, Mr. Santley, Mr. Henry Irving, Signor Nicolini, and Signor Foli.

A publican, at Langley, Bucks, last week was fined £4 8s. and costs, for exposing himself amongst his customers whilst suffering from small-pox. His medical attendant gave evidence as to the danger he ran of spreading infection.

Last week the wife of a travelling tinker gave birth to four children—three boys and a girl—in a cave off the road leading along the shore about two miles from Oban, in Scotland.

Scarlet fever is reported to be raging in Liverpool, and fears have been expressed by the Health Committee that the disease may become an epidemic.

Correspondence.

"THE IRISH APOTHECARIES' COMPANY AS A LICENSING BODY."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The writer of the article in your journal of the 26th ult., entitled "The Irish Apothecaries' Company as a Licensing Body," appears to be very ignorant indeed of the history of this Institution for the past forty years, several of his unfriendly statements and accusations having been over and over again refuted both in and out of Parliament. The Hall, he states, was incorporated in the reign of George III., "its function being to promote pharmacy;" but another important function, "to regulate the profession of an apothecary throughout the kingdom of Ireland" he leaves unnoticed. Contrary to his assertions, the Hall was not authorised to examine and license pharmacists, to inspect apothecaries' shops, nor to generally superintend the supply of pure drugs to the public, and the Hall did constantly prosecute the unqualified compounders of medical prescriptions until the Pharmacy Act of Ireland came into operation. The creation of

sixty shares was strictly in accordance with the Act of Incorporation, and the Court of Directors have, from time to time, endeavoured to remedy the imperfections of the system as far as legal and other obstacles permitted. The directors and examiners are annually elected by ballot. At present the number of licentiates entitled to vote at the elections and to attend the quarterly meetings, &c., is 31—not 21 as stated in the journal. If all these voters do not fulfil their duties the Hall cannot be fairly blamed for it, and possibly not a few of the other medical examining and governing boards are chosen by an equally limited number of electors. It is quite true that during the past fifty years important changes have been made in the curricula of education and examination, not, however, at the dictation of the respected secretary, who is at present in London, but in harmony with the spirit of the age and the example of all the other medical institutions of the empire. The assertion that "to entice students to the doors of the Hall the diploma-fee of the Company was reduced to half-a-sovereign" is totally untrue. The return called for by the Pharmacy Act Committee of the House of Commons in 1876 shows that the yearly average of successful candidates for the licence of the Hall was 27—not 10, as stated in your journal—for the previous forty years. Last year 24 candidates obtained the licence. In the published minutes of the General Medical Council from January to May, 1878, a table is inserted "showing results of professional examinations for degrees, diplomas, and licences granted in 1877 by the Bodies in Schedule (A) of the Medical Act." Ten candidates obtained *medical* diplomas from the University of Oxford, 15 from Cambridge, 4 from Durham, 33 from that of London, 31 from Aberdeen, 11 from St. Andrews, 30 from Trinity, Dublin, 44 from the Queen's, and 21 from the Faculty of P. and S., Glasgow. With these returns the Hall does not contrast unfavourably. With respect to the examinations, it is sufficient to say that they are conducted in accordance with the recommendations of the Medical Council, that marks are given, and the general answering taken into account by the examiners; that they have been supervised by the inspectors appointed by the Medical Council, and very favourably reported by them to the Council. The writer of the article should have known that the licence of the Hall has been acknowledged as a suitable medical qualification for all the public services—Army, Navy, Poor-law, &c., by the Government, as well as by the General Medical Council, and therefore, that the right of the Hall to take part in the Conjoint Examination Scheme has been fully established.

I am, Sir, your obedient servant,

JAMES SHAW, Governor.

By order of the Court.

[The Irish Apothecaries' Company accuses us of ignorance of the history of the Institution, and opens its criticism upon our observations by the attempt to prove that the Hall is not, and never was, a Pharmaceutic Corporation. Let us see whether this assertion is borne out by the facts. The Act under which the Hall was incorporated is entitled "An Act for the more effectual preserving the health of His Majesty's subjects, for erecting an Apothecary's Hall in the City of Dublin, and regulating the profession of an Apothecary throughout the Kingdom of Ireland," and the Governor seems to imply that "regulating the profession of an apothecary" should be understood to mean licensing the general medical practitioner. We assert that the Act attached no such meaning to the words—that the Irish Apothecaries' Company never was, legally, anything but a pharmaceutical licensing body, and that its unsuccessful attempt to erect itself into a medical qualifying institution could not give it any right to take part in the arrangement of a medico-licensing system. In view of the words of the Act it is indeed a ridiculous pretension to claim for the Hall any other function than that of pharmacy regulation. The preamble of the Act states the reason for the establishment of the Company in the following terms—"Whereas great inconveniences have arisen from the want of an Hall *amply supplied with medicines of the purest quality*, prepared under the inspection of persons well *skilled in the art and mystery of such preparations.*" Section 5 after enumerating the constitution of the Board, says, "And for the better ordering, managing, and governing the *preparations, stock, or other affairs* of the said Corporations;" and, again, in the same section, "provides for the appointment of a Court of Directors for *inspecting* and *directing all chemical and compound preparations and experiments*, and for ordering the affairs of the said Corporation."

From the preamble of the Act it is manifest the Government of the day simply intended to make a Pharmaceutical Society, to ensure pure drugs being used in the compounding of prescriptions, and to give power to properly skilled persons to see that the public should be supplied with trained compounders, and that the pure drugs were kept separate from oils and paints in the shops of the apothecaries—surgeries were unknown then; so jealous is the Act of the Hall over-stepping its proper limits that it refuses the Company permission to alter a single formula without the consent of the College of Physicians, confining them to the position of skilful traders—who should keep and vend pure drugs, and prevent unqualified persons being employed in the business (sec. 18); they are to see that drugs are properly kept, and not in the same room in which arsenic, oils and paints are sold by the apothecary (sec. 28).

Throughout the Act there is not a single word justifying the pretension of the Company to grant medical degrees; and, it is obvious that traders who are recognised by the Act as engaged in grinding paints, mixing oils, and such like employments could not have been intended to visit, prescribe, and operate and upon a diploma fee of ten shillings, and *no more* (*vide* section 24), present themselves to the public as physicians and surgeons.

The Company has quoted for its answer to these facts the precedent of the Apothecaries' Company of London, the license of which has been always recognised as a medical qualification, but this argument, upon examination, only tends to the discomfiture of those who make use of it. The English Apothecaries' Company is, indeed, established by the law as a doctor-making body, and not as a drug selling establishment. By the English Act (55 Geo. iii., cap. 194, A.D. 1815), the Company "is authorised and required to examine each person or persons applying to them for the purpose of ascertaining the *skill and abilities of such person in the science and practice of medicine*, and his or her fitness to practise as an apothecary." On the other hand, the only license which the Irish Company is entitled by its Act to grant, is "a certificate to open a shop or follow the art or mystery of an apothecary," the nature of that "art or mystery," being plainly indicated by the words of their sections which we have already quoted. That this, and this only, was, and is the legal function of the Company was the decided opinion of Lord O'Hagan, lately Lord Chancellor of Ireland, and of the present Judge Lawson.

In face of these provisions of the Act we feel justified—notwithstanding the statement of the Governor—in asserting that the Hall is authorised conclusively and solely to "examine and license pharmacists to inspect apothecaries' shops, and to superintend formally the supply of pure

drugs to the public ;" and we appeal for corroboration of this statement to the admission by the Governor that the Hall " did constantly prosecute the unqualified compounders of prescriptions," which they could not have done unless they legally possessed the functions which they now repudiate. The Company, in fact, owes all the status which it possesses as a medical licensing body to Dr. Hargrave and Dr. Embleton, the respective representatives, at the time, of the Irish College of Surgeons and the University of Durham in the General Medical Council. On the 16th of August, 1860, the Secretary for War officially informed the Director-General of the Army Medical Department that "as soon as L. A. H's shall have been admitted by the General Medical Council to registration as medical practitioners, and the license shall be received as one entitling the holder to compete for appointments in the army, *and not before.*" Thereupon the Director put the question to the General Medical Council whether or not the license was so recognised. After several evasive letters addressed in reply to the Director-General, the Medical Council at length came to a vote, and on the 4th of July, 1861, by a majority of 13 to 8, adopted a resolution—moved by Dr. Hargrave, and supported by Drs. Embleton and Bond—by which they declined to express any opinion in favour of required recognition. The Hall had, of course, been recognised as a pharmaceutical qualifying body four years previously by the Medical Act of 1858, but this was the first time that recognition as a medical licensing body had been claimed. At the meeting of the General Medical Council in 1862, the same refusal of recognition was reiterated, but on the 2nd of June, 1863, a resolution was adopted, by a majority of 14 to 9, " that registered licentiates of the Apothecaries' Company of Dublin are, as apothecaries, entitled to practise medicine." This resolution, as we have said, was carried by the change of sides of Mr. Hargrave, Dr. Embleton, and Dr. Bond, who, having spoken and voted against it previously, now repented and went over to the apothecaries. It has always been understood that the transaction was a bit of medico-diplomatic bye-play, by which the Irish College of Surgeons intended to play off the " Hall " against the College of Physicians. But that as it may, it is the fact that Dr. Hargrave and his two coadjutors were the men who chartered the Irish Apothecaries' Hall as a medical licensing body, and enabled them to claim the army and navy and poor-law authorities which the Governor now boasts of. It is necessary for us to enter upon these details, although, to most of our readers they are already well known, because we are called upon to prove that the Irish Apothecaries' Company has no right to interfere in the deliberations of the General Medical Council, or in the examination of medical candidates, and that any such privileges which it now exercises are pure usurpations, for which it has no warrant either in law or expediency. We might, however, be induced to overlook the legal falsity of the Company's pretensions, if it could be shown us that they represent any section of the profession which is entitled to respect, or perform any substantial work on behalf of the public or the profession ; but the Hall really possesses no such claim upon our sympathies. Who does the present Medical Council representative of the " Hall " represent? He enjoys the distinction of being the chosen mouthpiece of a majority (say eight) out of the fifteen directors, who—if elected by a free vote—would represent the opinions of—Whom? Of the twenty-one shareholders in a drug shop, who (out of a total of thirty-one who might vote) see fit to exercise their suffrage. On the most comprehensive view of Dr. Leet's constituency, he is the representative of thirty-one partners in a large apothecaries' shop. The licentiate apothecaries of Ireland have absolutely no voice whatever either in Dr. Leet's appointment or the views which he expresses by his Medical Council vote, and inasmuch as it is admitted that the Hall does not now represent Irish pharmacy, we fail utterly to understand what quota of medical influence, interest, or opinion it is supposed to contribute to the decisions of the General Medical Council.

Even if the Hall continued to grant twenty-four licences a year at sixteen shillings each, we fail to see that that share in medical licensing would give it a claim to take part in the conjoint examinations of the future. We did not—as the Governor represents us—fix the number of licenses now granted at ten. We stated that, after the assumption of the doctor-making function of the Hall, " the number of licences fell away year after year until they reached the imposing number of ten." We believe that that number of licences granted within a year will be found in a Parliamentary return presented some years ago upon the motion of Sir John Gray, M.P., and, if so, our statement is accurately true. The Governor takes exception at our reference to the diploma-fee charged by the Hall. " Ten shillings and *no* more " is the amount named in the Act, and although candidates are charged sixteen shillings for the certificate, as the Act styles it, or diploma, as the Company name it, the amount is ten shillings in the Act, and no doubt the directors would amend the sum if they had the power. As to the examination for the licence, which the Governor states to have been very favourably reported upon by the Visitors of the General Medical Council, we venture to remind the directors that portions of the examination were not only not approved, but emphatically condemned at the last visitation. But if it were otherwise we should still look, from the information we possess, with suspicion upon the examinations held since then and in the absence of these Visitors.

Is it or is it not a fact, that a candidate lately obtained the L. A. H., and went forth into practice as a general medical practitioner, who called gamboge, ferrocyanide of potassium ; tasted aloes, without knowing what they were ; handled colocynth, and calling it a poppy-head ; stated he would *boil* infusion of yellow bark all night ; failed to recognise gentian, cinchona, or chirreta, or quassia ; and in chemistry, did not know how to detect the presence of ammonia in solution ; and on being handed some sixty prescriptions, declared he could not read any one of them ! Is it also the fact, that on last Friday seven candidates received the certificate, stating the examiners were satisfied with their answers on pharmacy, materia medica, anatomy, physiology, and the microscope, although the Materia Medica Examiner protested against the granting of the certificate to some of them ?

We emphatically repudiate the least desire to deprive

the Irish Apothecaries' Company of its legitimate functions, or to prejudice its status as a pharmaceutical corporation; but, with these facts before us, we protest against the Company being admitted to a share in the conjoint examinations which are about to be established; and we object to the existing exercise by it of an influence upon medical affairs equivalent to that exercised by the most useful, unimpeachable, and respected of the qualifying bodies.

ALCOHOL IN THE ARCTIC REGIONS.

"Others (of the medical profession) have thought little about the matter . . . . and in their practice are guided more by the feelings and taste of their patients, than by their own convictions on the subject."—*Medical Press*, March 6, page 199.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As my only object in writing was to elicit evidence as to the use or non-use of alcoholic stimulants in Arctic Explorations, I pass over the irrelevant verbiage of your correspondent "Zero," and refer him to the *Temperance Record* of May 9, 1876, (No. 1154) published at 337 Strand, London, in which well-known journal he will find Captain Wiggins' letter. Had "Zero" given his address (or applied to me, or better still to Captain Wiggins himself, both addresses being printed in your columns, there would have been no necessity for his cynical remarks), I would have forwarded to him the information he so piteously says he sought in Dublin in vain.

I have not gone all through the Blue Books referring to the late inquiry, but I have read quite sufficient to confirm me in my opinion that alcohol should not be used at all; and cannot understand "Zero's" conclusion to the contrary, unless that gentleman belongs to the class alluded to in the quotation from your own columns given at the head of this letter. Surgeon Colan said "that 38 out of 39 cases of scurvy occurred during the travelling in sledges, only one case of a man who had stayed on board ship . . . and who was of intemperate habits. He considered that in any future sledge party if one article has to give way to another, it would be better that the rum should be omitted." Dr. F. de Chaumont (who disapproves of total abstinence, unless in exceptional cases, as he thinks the temperance cause is injured by attempting "to decry alcohol utterly") gave the following evidence during the Arctic Committee's inquiry: "Question 5101. With reference to the sledge diet, rum and tea were always taken; and we have had evidence before us that the men invariably found the tea more invigorating to travel upon . . . Have you any opinion as to the administration of rum and tea under extreme exposure and hard work?—I think that tea is decidedly preferable to rum." Again: "5102. As a stimulant and as a corrective? Yes, as a refreshing beverage. I assisted at a number of experiments made by the late Dr. Parkes, of Netly, on that subject, and I saw the men under experiment, and all who were experimented upon gave it as their opinion that the rum was the worst thing to work upon. 5103. Then would you altogether exclude rum from the diet? I would not altogether exclude it, but I think that knowing as we do that alcohol acts to a certain extent in lowering the temperature of the body, and that it is a bad thing to work upon, I certainly would put it last in the articles of diet." Dr. de Chaumont, in answer to further questions, said he thought "IT PROBABLE" that rum was valuable under certain conditions, after the men had camped out in the evening, &c.

Dr. John Rae, who perhaps is as well qualified to form an opinion on this matter as any man in the world, not even excluding "Zero," has over and over again attributed the break-down of the late expedition to the rum which was taken by the men; and quite recently (June 6), at a meeting of the Medical Temperance Association, he said "he was educated where it was the fashion to give much alcohol, and he was only led to abandon its use as a result of his experience. Among his first Arctic experiences was this, that he had charge of a crew of whom half were attacked with scurvy, and he found that these were all men who had used the least alcohol, and the severity of the disease was in proportion to the amount which had been taken. He had been confirmed in this view by much subsequent experience, and he could assert most positively that total abstinence was the right practice for those who had to be exposed to excessive cold. *He traced the failure of the late Arctic expedition to scurvy, and this to the use of alcohol* and deficient use of anti-scorbutics when most required. As there were now a sufficient number of totally abstaining officers and men to man two or three ships, he hoped that the Admiralty would man at least one in this way; it would be a safe ship for any sailor who showed a tendency to intoxication, and the experiment would be made as to whether it was advantageous or not."

Mr. Froome Talfourd, having been thirty-eight years in the Hudson's Bay territory, corroborated Dr. Rae, and said "every case of death from cold which he had known had been due to the use of alcohol."

S. S. Alford, Esq., F.R.C.S., in a paper on "Dipsomania," read before the Manchester Statistical Society, asserted that:—"The abstainers in the late Arctic expedition endured the cold with less difficulty, and even with less bad effects, than those who resorted to the moderate use of stimulants."

The temptation to extract largely from various authentic sources is very great; but I withhold my pen, fearing that this communication is already too lengthy. I would, however, crave permission to refer your readers—more especially "Zero"—to an exhaustive *résumé* of the whole question in the *Leeds Mercury* (reprinted in the *Watchword*, April 11, 1878) in which even Captain Nares himself is reported as saying that "both officers and men were unanimous in favour of the change" from rum to tea.

Adam Ayles, a Good Templar, and one of the six abstainers in the Expedition, was out on sledging duty 110 days, and his evidence is "that neither of us [abstainers] were attacked by scurvy," and they surpassed the remainder of the *Alert's* crew in the number of days they were out. Ayles was 84 days absent from the ship at one time, and I find no record of the frost bite which "Zero" says *prevented* the abstainers going on sledge duty. On one of these journeys an officer implored Ayles to take some spirit; Ayles was too good a judge, and so he escaped "frost-bite, scurvy, or any other sickness." Let me now refer "Zero" to Captain Scoresby, who calls the use of alcohol a "mischievous delusion" under the chilling region of the Pole. Dr. J. D. Hooker, one of Sir John Ross's medical officers, says some of the best men "never touched grog" in their Antarctic cruises, and "the use of spirits in cold weather is prejudicial." Captain Ross says, "it is sufficient to give men the usual grog, to perceive that in a few minutes they become languid." And Captain Parry in answer to the question "are spirits necessary?" replies, "I say decidedly not; they let the cold in." He further says they substituted tea for grog, and "it did the men more good." Captain Kennedy, who went to search for Franklin, asserts that when his men landed at Aberdeen, experienced men said no crew had ever landed in such admirable condition, "and not one of them during the whole cruise tasted one drop of alcoholic beverage." It was owing to this observance of total abstinence principles that they accomplished more than any one of the thirteen vessels which went out during the same year.

Time would fail me to quote authorities, to whom perhaps "Zero" would listen respectfully; so I only mention in conclusion Dr. Kane, the American Arctic explorer; Dr. Hayes, who sailed with him; Sir John Richardson; Sir Garnet Wolseley; the Hudson's Bay Company; and Inspector General M'Clean who, writes, "the preference given to spirits over lime-juice for the sledging parties in Captain Nares's expedition, *was a fatal mistake*."

"Zero" sneers at my "modesty." It was indeed "modesty" which induced me to call attention to such conclusive facts, given by such men. My own opinion is not worth anything. But if "Zero" would be a sharer in the admirable quality he contemns he will perhaps be a little less positive when next he tries by mere assertion to disprove statements which are so well-known to more cautious men.

I am, Sir, yours faithfully,

Poland Street, W. H. P. G.

QUEEN'S COLLEGE, GALWAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As you were so kind as to publish a letter of mine

last October, I trust you will insert the following in the columns of your journal. Last session, 1877-78, there were 110 students taking out Practical Anatomy. *Thirteen subjects* were provided for their instruction. This needs no comment from me, as the profession will at once see what facilities are given in this school to learn this important branch. The lectures in some subjects were not commenced until very late on account of the change of professors, and the anatomical and physiological museum was more jealously closed than before. Now what has been the result of all this?

Not a single student direct from Galway obtained the degree.

Eight men, also direct from Galway, presented themselves for the second University examination. Three passed, only two of these took out their entire lectures in Galway. This percentage of unsuccessful candidates for an University examination is without parallel. The supply of subjects will be even worse next session, as the Board of Poor-law Guardians of this Union have passed a resolution to the effect "that in future the bodies of unclaimed paupers should not be handed over to the Medical School, Queen's College, Galway, for anatomical purposes." This is a very serious blow to this medical school, as it was altogether depending on the workhouse for its supply of subjects.

The University examination was the most difficult one that has ever been. Questions were given in the second half that were altogether outside the prescribed curriculum, "such as nervous supply," &c., and the examination on the subject was most crucial; no person but an accomplished anatomist could have made any marks at all. This is, of course, very gratifying to the junior examiners in Anatomy and Physiology, as it makes them members of the most severe examining board in Ireland; but I would wish to remind them of the fable of the "Boys and the Frogs."

Trusting that something will be done next session to provide the students with facilities to acquire the amount of practical anatomical knowledge requisite for the University examination,

I remain,

Your obedient servant,

MEDICAL STUDENT, Q.C.G.

Literary Notes and Gossip.

WE are promised during the next few days "A Sketch of Eastern Russia," by Mr. Roth, who is, we believe, a member of the medical profession, and has lately been travelling in that country.

***

IT is reported, says the *Student's Journal*, that the learned Orientalist, Ebers, has just discovered at Cairo a medical book written 3,500 years ago. The time of publication is coeval with the rule of Joseph in Egypt. We think this one of the most hopeful announcements for medical science we have met with!

***

WE regret to hear of the death of Dr. Clarke, the accomplished author of those philosophical *brochures*, "The Building of a Brain," and "Sex in Education," each of which has been very widely read, and often quoted by opponents of the women's question. Dr. Clarke was an American physician, and has passed away somewhat suddenly in the middle of life.

***

A NEW work from the pen of Dr. Aveling will shortly be published under the title of "The Influence of Posture in the production of Disease." Arrangements have, we understand, been made for translations in France and Germany. There is a good deal of speculation afloat, respecting the line of argument the author—who has already established a reputation as a careful observer and writer—may take.

***

THERE is a hitch in the publication of the second edition of Dr. Playfair's "Science and Practice of Midwifery." A few copies were delivered some days since, the rest were stopped as "there is something wrong in it." It would, indeed, be a wonderful book to be free of errors, and it is probable that there is nothing more serious with "Playfair," than a printer's or binder's error.

***

THOSE of our readers who intend visiting Paris during the Exhibition, will be glad to know of a little book by Dr. de Blincourt and Mr. J. Carter, entitled "How to get along at the Paris Exhibition." Those who understand the French language, will find in it a good deal of useful and well arranged information; whilst for those who cannot speak French, tables of ordinary sentences and short conversations are appended, with their pronounciation so simply indicated that anyone will find them of great service without previous knowledge.

***

WE understand that the second edition of Gant's Surgery is approaching completion, and will be issued by Messrs. Baillière, Tindall, and Cox, about the end of September. The work will be considerably larger than the former edition, and will appear in two volumes with about 1,000 illustrations, mostly original. In his new work, Mr. Gant has enlisted the valuable assistance of Professor Erasmus Wilson, F.R.S., Professor Tomes, F.R.S., Dr. Robert Barnes, Mr. Henry Power, Mr. William Adams, Dr. Morell Mackenzie, and Dr. Laidlaw Purves; the work should therefore become one of the standard text-books of English surgery.

***

A NEW work entitled "Studies in Pathological Anatomy," has just been commenced in monthly parts; and if we may judge the whole by the first four parts which have reached us, it is likely to be several years in completion. It would have been well when issuing what will manifestly be an expensive work, for the publishers to give an approximate idea of the number of parts to which it is likely to run; as they have not done this, many will propably hesitate to subscribe for "a pig in a poke." We ought to mention that Dr. Delafield, author of a very good work on postmortems, is the Editor, and Messrs. Wood and Co., of New York, the publishers, than which, no firm turns out better finished work in America.

***

WE hear that several large orders for some of the most recent English medical works have been received by the publishers in this country from America. One house has taken 500 copies of Lennox Browne's work, "The Throat and its Diseases." A like order for Drs. Witkowski and Semple's "Moveable Atlas of the Human Body" has been received; and Dr. Brinton, of Philadelphia, has sent a very extensive commission for Claude Bernard's splendid work, which has just been translated by Mr. Norton, of St. Mary's Hospital, entitled "A Text-book of Operative Surgery and Surgical Anatomy." This is a much more respectable mode of treating English author's and publishers, than pirating their productions.

***

THE month of June is usually a light one in the publication of new books, and this year perhaps even fewer have been issued. These are Dr. M. F. Anderson, "Phosphates in Nutrition," crown 8vo, 5s. (Baillière, Tindall, and Cox). Dr. R. Barnes, "Clinical History of the Medical and Surgical Diseases of Women," 2nd edition, 8vo, 28s. (Churchills). Professor Claude Bernard (the late), "Text-book of Operative Surgery and Surgical Anatomy," English Edition, by Arthur T. Norton, F.R.C.S., crown 8vo, 88 steel plates, plain 25s., coloured 50s. (Baillière, Tindall, and Cox). Dr. Fothergill, "The Antagonism of Therapeutic Agents," crown 8vo, 6s. (Macmillan and Co.). Dr. de B. Hovell. "On Vaccination," pamphlet, 6d. (Simpkin and Co.). Dr. Onimus, "Practical Introduction to Medical Electricity," 8vo, 5s. (Lewis). "Army Medical Department," Standing Orders, 16mo, 1s. (Clowes). Dr. Tanner, "Memoranda on Poisons," 4th edition, 32mo, 3s. 6d. (Hy Renshaw). Dr. Armand Semple, "Aids to Chemistry," part ii., 1s. 6d. (Baillière, Tindall, and Cox). Mr. Meymott Tidy, "Handbook of Modern Chemistry," 8vo, 16s. (Churchills). Mr. G. S. V. Wills, "Manual of Vegetable Materia Medica," crown 8vo, 5s. 6d. (Simpkin). Dr. Witkowski, "A Moveable Atlas of the Human Body," folio, coloured plates, and 8vo text 7s. 6d. English translation by Dr. Hunter Semple (Baillière, Tindall, and Cox.)

PROVIDENT DISPENSARIES.

An important meeting was held yesterday in the rooms of the Society of Arts, when a valuable paper was read by Sir C. Trevelyan, entitled, "How District Committees Can Assist in the Extension of the Provident Dispensary Movement." There was a good attendance of medical men and others interested in this great social question, and an animated discussion followed. The author, in the course of his address, urged that the present system of medical relief was a failure, and that the medical profession could be placed in a satisfactory relation to the working classes only on the principle of mutual assurance, and by the establishment of provident dispensaries, both the medical men and the poor people would derive benefit, not only directly, but indirectly. If placed on the provident principle, existing dispensaries would be greatly strengthened and enlarged, and a vigorous and expansive system would be substituted for an effete one. The provident dispensary system, being based upon a principle of self-support, was capable of unlimited extension. Every additional member added to its resources in a greater degree than he did to its burdens. But, replete with benefits as as this system was, its advantages had to be explained to those affected by it; various administrative arrangements had to be made before a provident dispensary could be solidly established. He suggested that each committee should appoint a sub-committee, specially charged with the duty of considering, in detail, how far the existing means of medical relief in the district were sufficient; of suggesting the arrangements required to place them on a satisfactory footing; and of giving practical effect to the changes which might be resolved upon.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

Indigestible.—A young man in Chicago, says the *Students' Journal*, was recently found dead in his bed, and the supposition was that he committed suicide by poisoning, but, upon analysing the contents of his stomach, *nothing but the following* was found in it:—Pickles, pound-cake, lemonade, cold turkey, beer, fried oysters, cold punch, ham sandwich, sponge-cake, beef-tea, mince-pie, champagne, lobster, game-pie, fruit-cake, tea, chicken-salad, whisky, coffee, Bologna sausage, port, cheese, sardines, and sherry. The jury returned a verdict of "Died through the visitation of friends!"

F.R.C.S. will find an answer to his question in our annotations of the present number.

Mr. J. W. S.—It is a very rare occurrence, we have heard of such cases but never saw one in hospital or private practice. We should decidedly counsel you to bring it before one of the Societies next session in order to clear up those points which you are justified in holding in doubt.

VACANCIES.

Burton Infirmary.—House Surgeon. Salary, £130. Applications to J. C. Grinting, Hon. Sec., Burton-on-Trent.

Leicester Borough Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board and lodging. Applications before the 18th inst. to Dr. Finch, at the Asylum.

Lock Hospital for Males, Soho, W.—House Surgeon. Salary, £50, with board and lodging. Applications to the Secretary at the Hospital before July 22.

Manchester, General Hospital for Sick Children at Pendlebury.—Physician. Salary, £300. Occupant of the post may engage in consulting but not general practice. Applications before July 29. (See Advt.)

Newport Union, Achill Dispensary District.—Medical Officer. Salary, £100, exclusive of fees. Applications to Mr. Carr, Achill, Newport. (See Advt.)

Owens College, Manchester.—Demonstrator in Anatomy. Salary, £100 Applications, with testimonials, to the Registrar before July 15. (See Advt.)

Royal Albert Infirmary.—Junior House Surgeon. Salary, £60, with board. Applications before July 29 to the Hon. Sec. at the Infirmary, Wigan.

Southport Convalescent Hospital.—Resident Medical Officer. Salary commencing at £80, with board. Applications to the Chairman before July 20.

The Brown Institution.—Professor Superintendent. Applications to, and further information of, the Clerk at the University of London (See Advt.)

APPOINTMENTS.

Dunn, H. P., M.R.C.S.E., House Surgeon to the Seamen's Hospital, Greenwich.

Fonmartin, H. de, M.D., M.R.C.P.L., House Physician to the Seamen's Hospital, Greenwich.

Grewcock, G., M.R.C.S.E., Medical Officer and Public Vaccinator for the Ropsey District of the Grantham Union.

Harday, G., M.R.C.S.E., Medical Officer and Public Vaccinator for the No. 6 District of the Daventry Union.

Lloyd, T. L., L.R.C.P.L., M.R.C.S.E., Medical Officer for the Ashley District of the Drayton Union, Salop.

Macdonald, R., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the South District of the Poplar Union.

McIver, W., M.D., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, Medical Officer of Health, &c., for the Moneymore Dispensary District of the Magherafelt Union, co. Londonderry.

Mayberry, F. G., M.B., C.M., Medical Officer and Medical Officer of Health, &c., for the Kenmare Dispensary District of the Kenmare Union, co. Kerry.

Michell, H. S., M.R.C.S.E., Assistant Medical Officer to the Wiltshire Lunatic Asylum, Devizes.

Murtagh, E. J., M.D., L.R.C.S.I., Medical Officer and Medical Officer of Health for the St. Peters's East Dispensary District of the Drogheda Union, co. Louth.

Scott, J., M.B., C.M., House Physician to the Bristol Royal Infirmary.

Scott, W. E., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer to the Lincoln General Dispensary.

Smith, J. G., M.B., C.M., Medical Superintendent of the Bristol Royal Infirmary.

Tweedy, J., L.R.C.P.Lond., F.R.C.S., Assistant Surgeon to the Royal London Ophthalmic Hospital, Moorfields.

Watson, C. S., M.B., C.M., Junior Resident Medical Officer to the Hospital for Sick Children, Pendlebury, Manchester.

Birth.

Quinlan.—July 7. at Leinster Road, Dublin, the wife of Dr. Quinlan, of a daughter.

Marriage.

Greenfield—Foster.—July 4, at Highbury Chapel, Bristol, W. S. Greenfield, M.D., M.R.C.P.Lond., to Charlotte, youngest daughter of J. Foster, Esq., of Bristol.

Deaths.

Bullock.—On June 28, at Cumberland Place, Hyde Park, Henry Bullock, M.R.C.S.E., aged 66.

Clark.—On June 18, at Christchurch, Hants, Robert Oke Clark, M.R.C.S.E., aged 52.

Fulton.—On June 20, at East Dulwich Grove, J. Fulton, L.K.Q.C.P.I., late of Firmount, co. Dublin, aged 34.

Fraser.—On July 2, at Merlewood, Inverness, J. G. Fraser, M.D., late of the Bombay Medical Service.

Howden.—On June 27, at Haddington, Thomas Howden, jun., M.D., aged 38.

Jones.—On July 23, at Watton, Brecknock, Wm. Jones, M.R.C.S.E., aged 38.

Orgill.—On June 26, John Orgill, L.F.P.S.G., of Stranraer, Wigtownshire, aged 73.

Shipton.—On July 2, suddenly, at Warwick, Surgeon-Major J. N. Shipton, M.D., Army Medical Department.

Taylor.—On June 28, at Cricklade, Thomas Taylor, M.R.C.S.E., aged 84.

Watson.—On June 24, at Lancaster, William Watson, M.R.C.S.E., aged 40.

Wilson.—On June 19, at Pocklington, Thomas Wilson, M.D., aged 72.

Winkfield.—On July 1, at Shirley, Hants, W. B. Winkfield L.R.C.P., M.R.C.S., aged 43.

HYDROPATHY.

By E. MARLETT BODDY, F.R.C.S., F.S.S., Etc.

Hydropathy (which is derived from two Greek words, ὕδωρ water, and πάθος affection, and which signifies in the common acceptation of the word, the water cure, or diseases treated with cold water both internally administered, and externally applied), has been eulogised by many and condemned by many, but it has, nevertheless, been able to stand its ground. Of late years it has been considerably decreasing in popularity, owing to the practice, not being exactly abused, but unfortunately being advocated in cases where such treatment was decidedly inappropriate, like many other theories which, though based upon fact, have, through too great an eagerness of believers to promulgate the presumed advantages upon adventitious and insufficient data, lapsed, and been cast into the limbo of exploded hypotheses and extravagant ideas.

But as regards my own view of the matter, hydropathy offers numerous and undeniable advantages both to the physician and surgeon, and I have found it, as the following remarks will tend to show, of great utility, both in internal and local derangements of the system; besides, I think when mankind is so bountifully supplied with such a health-sustaining fluid, we should not act like the fortunate, ignorant heathen who found a hidden treasure and was unable to decide whether to use or abuse it, but conclude that a fluid which is necessary to life cannot be otherwise than beneficial in staying the advances and overcoming the effects of disease, and I think we may justly regard it as a thoroughly established fact, that cold water in internal and external lesions is advantageous in every respect: exceptions there are, but they are in the minimum; even in these the ingestion of cold water is beneficial as being refreshing and slightly exhilarating, especially when the patient is weakened and fagged out by continuous pain and mental excitement.

Take for instance the zymotic diseases, what better drink can we advise than cold water? it is for this cooling beverage that patients in the burning heat of fever crave: how refreshing it is to their dried lips and parched tongues! Take phthisis in its several stages—the desire generally is for cold water, especially in the stage which terminates in death: what gives greater ease and comfort to patients suffering from sprains, dislocations and fractures, than cold water applications? It gives more relief in affections or injuries to the brain than any other treatment that we can pursue; we exclude, naturally, those cases which are only amenable to the operation of trephining—even in these desperate cases it is beneficial.

In that usually fatal disease peritonitis, and other abdominal lesions, sucking ice or drinking cold water considerably relieves the distressing sickness and pain, and also refreshes the patient. What stays the advance of diphtheria and soothes the inflammatory soreness of the back part of the mouth, more than cold water applications to the neck, combined with internal application of the solution of nitrate of silver? Even in those cases of simple sore throat, the ingestion of cold water effects a cure. That there are other remedies beneficial I deny not, but that they are superior to cold water I very much doubt, and I base my opinion upon what I have noticed at the various hospitals and in my own practice.

In all external lesions, whether the result of disease or accident, cold water applications cannot possibly do harm, and I have never observed during my experience any thing else than benefit accruing from them; exceptions there are, such as phlegmasia dolens and gangrene, when it is necessary to apply applications of heat. Even that incurable disease, cancer, may be partially arrested at its commencement, by cold water applications.

In all scrofulous affections, such as swollen and indurated glands, weak joints and enlargements arising from this defective condition of the constitution, cold water is the best local curative agent we possess: even in syphilitic nodes of long standing the application of it is remarkably efficacious; in fact, the prophylactic treatment, as it is

now technically termed, is with a few exceptions, beneficial, so much so, that I can call to mind in my own practice very few cases where it has not been productive of benefit, and conducive to a somewhat speedy recovery.

In rachitis, which is so prevalent amongst children in large towns, sponging the back with cold water every morning is both easy in performance and happy in its results, imparting strength and vitality to that important structure, the spinal column, and also bracing up the nervous system generally by acting on the spi al cord. Even in that rare and fatal malady—mollites-ossium (which is pathologically almost similar to rachitis, the only difference being that rachitis is common, and occurs in infancy, while the other is uncommon, and is seen in adult life), the treatment I have mentioned as efficacious in rachitis is equally so in this disease, though of course it is modified by the age of the patients.

I have found in a number of cases that cold water has acted marvellously. I have seen obstinate cases of elephantiasis (which is considered not only incurable, but altogether unamenable to treatment of any kind) reduced in a few weeks to moderate size. Ulcers, whether simple, indolent, or phagedænic, yield to cold-water treatment when persevered in; many cases I have on record, and others which are well impressed on my memory, have been cured by cold-water applications when other modes of treatment have signally failed, and I noticed when I was a student at the hospital that whenever cold water was resorted to happy results followed.

In all chest lesions, and especially pneumonia, phthisis, and pleurisy, the ingestion of cold water refreshes the patient, cools the mouth, œsophagus, and stomach, relieves the sickness and nausea, and as a sequence increases the urinary secretion, thereby relieving the bladder of sundry deposits, and also washes away any mucus which unavoidably collects in the urinary passages; also the pelves of the kidneys are cleansed by a continual supply of fluid and the phosphatic deposits, which are always present when the system is out of gaer, are perpetually being eliminated.

In phthisis especially these deposits remarkably increase, very few cases indeed have I seen of this disease where they are not present; in pneumonia they are to be seen, but not to such an excess as in phthisis, and the more rapidly they are eliminated from the system, the better it is for the patient, and cold water has a remarkable tendency towards the eradication of them, for it cleanses out all the passages which naturally are inflamed through the collection of the residue of the secretions, or we may more properly designate it, the collection of foreign matter, for their overplus may be justly considered so; and when it is so much in excess it must necessarily irritate those parts and passages through which it passes and in which it collects. There is another reason why I advocate the ingestion of cold water in these two debilitating and very frequently fatal diseases, which appears to be very cogent. In many cases which have come from time to time under my notice, I have invariably found that the patients complain of their water feeling hot while micturating. I can only account for this by the passing through the urethra of those deposits which no doubt irritate the mucous lining of this canal, and consequently inflame it; and have further noticed that those who complain of this burning sensation drink but little water, but have found that its copious ingestion has caused a cessation and diminution of this irritating heat; this is easily accounted for—if plenty of water is taken into the system it must naturally be eliminated either through sweating, micturition, or defæcation, and as micturition is the most ready way of eliminating it, the system is consequently ridded of them. We may compare the eradication of the surplus of these deposits to the *modus operandi* of sewage, for as the deposits of a common sewer are continually washed away by a flow of water, so are these deposits from the human frame.

Another irritating symptom we frequently meet with in these two diseases, and one I think always prevalent in any lesion of the respiratory organs—*i.e.*, a tickling sensation in the trachea, if of long continuance, exhausts the sufferer because of its pertinacity. I have known cold water relieve this distressing irritation to a considerable extent, so much so that many patients after experiencing relief from it, resort to cold water in preference to any other remedy. Ulcerated sore throat, diphtheria, and an inflammatory condition of the mucous membrane, of the air passages, resulting from catarrh or common cold in the head, are considerably relieved by applying a piece of linen soaked in cold water round the neck, and enveloping the same with gutta percha or oil-silk. I may as well mention that the soreness of the throat accompanying phthisis is not amenable to this treatment, for the origin is altogether different, and should we pursue the same course we should be doing harm instead of good; but in laryngitis and tracheitis not resulting from phthisis, the same method of treatment is of service. In any heart complication, whether arising from rheumatic fever or otherwise, the ingestion of cold water is highly pleasant to the patient, and affords some relief to the faintness which is always present in morbus-cordis; and I have seen it diminish the frequency of the heart's action in certain lesions of that organ, such as palpitation, which is sometimes so distressing to witness. It also has a tendency to relieve the action of the heart and the arterial system, for as the patient drinks, the more watery the blood becomes, and increases the quantity of the liquor sanguinis, and as a consequence it is more easy of propulsion; and it also passes with greater facility through the various arteries and arterial capillaries, so that the heart is considerably relieved on account of its work being diminished. Supposing not much benefit accrues from the ingestion of cold water in morbus cordis, no harm can possibly arise, even supposing the kidneys were in any way affected, and that œdema of the lower extremities were present; and in pericarditis cold water has a marked effect in relieving the pain and the horrible sensation of suffocation with which the patient is tormented. Many a time have I seen patients sinking from exhaustion consequent on this suffocation cry out in anguish "give me water," and when they have drunk the pain gradually subsides and the feeling of suffocation is relieved. I have never had an opportunity of testing its efficacy either in angina pectoris or in that peculiar distressing disease, exophthalmic goitre, though I am inclined to think that the ingestion of cold water in these two horrible diseases would be extremely beneficial; for, as I have said, it diminishes the frequency of the heart's action, therefore in the latter disease, in which the heart is so completely overworked that the unhappy sufferer lives four days in one, it would certainly have a tendency towards diminishing such an unnatural frequency.

I remember being called to see a middle-aged woman suffering from heart disease, and who was attacked by a severe and long fit of palpitation, and having no medicine with me at the time I was obliged to rely on cold water, and after persuading her to take some she appeared refreshed and desired more, when she began to revive and the palpitation gradually ceased. Afterwards she always accustomed herself, when attacked with the same distressing symptom of her disease, to drink cold water, expressing to me that she received more relief from it than from all the medicines she had taken. At first I was inclined to doubt her statement, but my experience has since shown me that it was not fancy nor exaggeration. One great fundamental reason why I so strongly advocate the use of cold water is that we may be sure that no evil can accrue from its ingestion, nor in the form of outward application in the majority of diseases, so that we may safely advise our patients to drink it almost with impunity, for it has no irritating effect on any part of the mucous membrane, and it soon enters the circulation, rendering the blood more liquid, and it does not injure the kidneys, even if those two organs are inflamed; in fact, it is alto-

gether harmless in its operations, and as I have previously observed, if no good accrues from its use we may be sure it is not provocative of harm. Those diseases in which water is of such remarkable utility are the zymotic, such as scarlet fever, small-pox, typhus, and typhoid. In the worst form of scarlet fever (that is scarlatina maligna, when the patient is tormented with intolerable thirst, and wild with delirium, with the temperature from 103° up to 104°, almost unable to swallow owing to the swollen condition of the pharynx), I have seen the sufferer seize, with the avidity of one bereft, a tumbler of cold water, drink it down at one gulp, and ask for more with imploring looks. Now, if we refuse complying with this request, and insist upon the fever-stricken patient only sipping it, or perhaps withholding it altogether, we only aggravate instead of satisfying him; therefore let him freely slake his thirst by frequently drinking, in fact, give it him *ad libitum*, and as the thirst is slaked, so will the fever diminish, the hot dry skin will soon be covered with a copious perspiration, and the anxious countenance will become calm and more tranquil, for we may be sure that what is grateful to the patient cannot be otherwise than condusive to recovery. Take, for instance, any one of the fevers I have mentioned, for in all there is the same foul parched tongue, dry mouth, hot dry skin, rapid pulse, temperature going up towards evening, and the pulse increasing in proportion, and there is the same craving for water; the local phenomena are different but the constitutional are the same. Now, invariably, all these patients have one craving desire for cold water, which if not acceded to, their thirst becomes more and more importunate, making them more restless and consequently aggravating the disease. Allowing the ingestion of water in these cases, will cause no flatulence or diarrhœa, and it cannot possibly injure the mucous membrane of the stomach; on the contrary it assists digestion by helping disintegration of any solids that may be in the stomach. I am aware that some authors affirm with very plausible language that the ingestion of cold water is provocative of diarrhœa and flatulence; notwithstanding the ingenuity of their arguments I must confess they build them on insufficient data, for from what I have noticed, if we advise patients not to slake their thirst, we not only prevent the diminution of the fever, but prolong the continuance of it; for as a natural corollary, patients, when their thirst is slaked, will naturally drink no more. We should promote the ingestion of cold water rather than advise a partial or total abstinence from it, for we thereby counteract the deadly and debilitating effects of the disease. We administer ipecacuanha and other sudorifics to promote perspiration and avoid the ingestion of cold water, so that these medicinal agents cannot act, simply because there is nothing to act upon. Now the ingestion of cold water is conducive to perspiration, and that which remains in the system is soon absorbed in the circulation and excreted by the kidneys, so that by its ingestion we promote further the elimination of the poison through the medium of the skin.

(*To be continued.*)

A VERY practical method of assisting the working of the Adulteration of Foods and Drugs Act, has just been initiated in the Bermondsey (South London) district. At the Vestry meeting, at which the analyst's report was presented, Mr. Churchwarden Sheppard, in alluding to the flattering result to the tradesmen of the parish, said it was only fair that the ratepayers should know the honest shopkeepers as well as the dishonest, and he therefore moved that when the certificate was received from the analyst, *the names of tradesmen from whom the samples were obtained should be read at the vestry meetings.* The motion was agreed to.

ON A CAUSE OF ERROR IN THE ESTIMATION OF MYOPIA BY MEANS OF THE REVERSED IMAGE.

By DR. A. DEHENNE, Medicin Aide-Major.

Translated from the Recueil d'Ophthalmologie,

By ARCHIBALD H. JACOB, M.D. Dub., F.R.C.S,

Formerly Ophthalmic Surgeon to the City of Dublin Hospital, and the Dublin Eye and Ear Infirmary.

NUMEROUS methods may be adopted by ophthalmologists for the diagnosis of myopia, and for measuring the extent of this anomaly of refraction; the method of Donders, the optometer, the simple ophthalmoscopic mirror, the refracting ophthalmoscope, and many others, the enumeration of which would occupy too much space. These methods of diagnosis complete one another, and, in the majority of cases, give nearly the same results. It is precisely on account of this, that at the present day, such precision, such almost absolute certainty, has been attained in the diagnosis of the anomalies of refraction in general, and of myopia in particular, this latter being occasioned in the greater number of cases by the excessive elongation of the antero-posterior axis of the eye. The myopic eye is too long in proportion to the refractive power of its dioptric system; all the rays, parallel to the principal axis, unite in front of the retina, or what comes to the same thing, the focus of the dioptric system of a myopic eye falls in front of the retina, as at F, (fig I.)

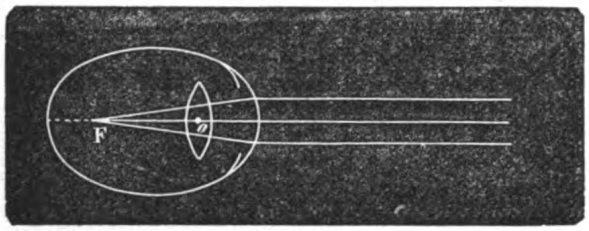

FIG. I.

If we refer to the optic properties of biconvex lenses (the dioptric system of the human eye may be compared to a biconvex lens, having a focus of 17 millim), it should be remembered that any luminous body placed beyond the principal focus of a biconvex lens, between the principal focus and the double of the focal distance, gives on the other side of the lens, an image real, reversed, and enlarged (fig. II.)

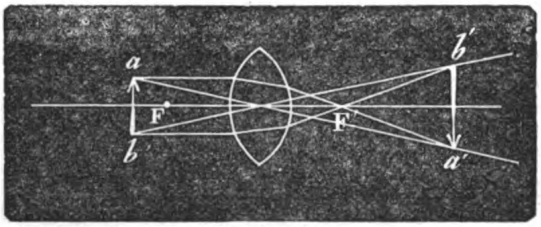

FIG. II.

This is precisely what occurs in cases of myopia. The retina of the patient, illuminated by the ophthalmoscopic mirror, becomes the luminous object; it is situated beyond the principal focus of the ocular lens of the observer; the image is then formed in front of the eye, so that, with sufficient power of illumination, and by means of a special disposition of the mirrors, it would be possible, in all myopic eyes, to receive on a screen from that point of the patient's retina which projects luminous rays into space, the image, *real, reversed, and enlarged.*

If any given portion of the retina (illuminated by the mirror of the ophthalmoscope) be represented by the arrow (a, b) (in practice it is the region of the papilla which is illuminated), the image will be formed at (*a', b'*,) (fig. III.)

b

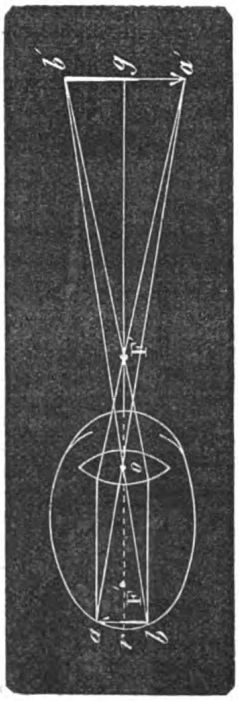

Fig. III.

This image is *real, reversed*, and *enlarged*. According to the laws of optics, the reversed image will be formed in front of the eye, at a point which varies with the distance which separates F from the retina (*r*) ; there is a constant ratio between the two distances *r* F and *g* F' (F' represents the anterior focus of the eye which is placed at a distance of 13 millim. in front of the cornea). The image is then formed in front of the myopic eye *at a distance which expresses the excess of refraction in this eye.*

This excess of refraction may be represented by a biconvex lens, placed before an emmetropic eye ; this is what is called the "*dédoublement*" of the myopic eye. (fig. IV.) (M. Perrin).

It may further be represented by the biconcave lens $m' n'$, which, placed in front of the myopic eye, brings back the focus from F to *r*. (fig. V.) This biconcave the $m' n'$, expresses the degree of myopia. Therefore, the distance in front of the eye at which the reversed image is formed, expresses also the degree of the myopia, as, from what has been already

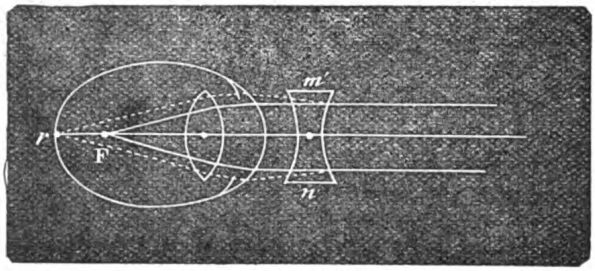

Fig. IV.

stated, this distance expresses the excess of refraction of the myopic eye ; but on condition that the papilla, the vessels of which form the elements of the reversed image, and the *macula*, be on the same level. It is from this point that the case which I narrate derives its interest.

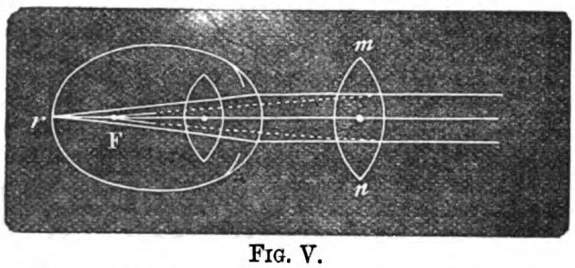

Fig. V.

To measure the myopia by means of the reversed image it is only necessary to know exactly the distance at which the reversed image is formed. For this purpose, the ophthalmoscopic mirror is employed ; nothing then remains but to seek the nearest point at which the vessels are no longer distinctly visible.

The observer knows his *punctum proximum*, has already determined it by the optometer of M. Perrin, or the card of Sheiner ; in this card are pierced two holes, separated by a space inferior in length to the mean diameter of the pupil. By advancing and drawing back we may readily find the distance at which the vessels are no longer visible. The observer measures the distance which separates his eye from the eye he is examining ; he subtracts the value of his *punctum proximum*, and the figure which remains expresses the degree of the myopia. The image is said to be reversed when, during the movements of inclination of the head from left to right, or *vice versâ*, it moves in a sense inversely to the head of the observer.

For example, let 12 inches be the nearest point at which the vessels are distinctly visible, the *punctum proximum* being 4 inches, the myopia may then be described as being a myopia of 8 inches.

This method is particularly valuable to a military surgeon, as by means of it he is entirely independent of the patient, whose interest it most frequently is to deceive him. It cannot, however, be employed in cases of slight myopia, because the reversed image is formed at too great a distance, and the eye is not sufficiently illuminated. The optometer and the refraction ophthalmoscope afford then valuable aid.

While making recently some statistic researches on the anomalies of refraction, I had occasion to examine the eyes of M. G——, medical student, who was serving his *voluntariat* at the military hospital of Versailles, as visiting pupil. I found at first a difference between the visual acuteness of the eyes at a distance of 15 feet.

S { OD=¼ / OS=1 } At a less distance the acuteness was the same in both eyes. This gave me reason to believe that this was a case of a certain myopic condition of the right eye. The trial by the pierced card confirmed me in this idea. When G—— looked through the small hole, the acuteness increased and became almost equal to unity. I then took the mirror of the ophthalmoscope, and satisfied myself of the existence of a very clear reversed image. I had here, therefore, a case of myopia. I measured it by means of the process already indicated, and to my great astonishment, the measurement indicated a myopia of 5 dioptrics. I was astonished at this result, because, in a myopia of 1-7th, the visual acuteness is always inferior to 1-4th. The left eye was emmetropic.

Proceeding then, as I naturally do, I examined the refraction by means of the optometer, which gave me a a myopia of 1-36th, and by the method of Donders, which corroborated the second result ; I corrected the refraction with a concave glass—36. This was the first time that I had met with such a considerable difference between the results given by the ophthalmoscopic mirror, and those given by the optometer and the proofs by glasses. Was this a case of a spasm of acccommodation, produced during the ophthalmoscopic examination ? It might possibly be so. I paralysed immediately the accommodation with atropine, and obtained the same results. I then examined the back of the eye, and much to my astonishment, I discovered a considerable excavation in the optic nerve. There was a notable difference of level between the macula and the papilla. The excavation was that which is met with in the clearest and most strongly developed cases of glaucoma. M. G—— had never suffered from his right eye ! It is probable also that he would never have observed the slight diminution of acuteness in his right eye, if I had not pointed it out to him.

Here was a case of a glaucomatose excavation of a type which had brought on no visual derangement, and which had never caused the slightest suffering. Besides this, all other symptoms of glaucoma were wanting. The slight diminution of acuteness at a distance, was due to a small degree of myopia proved by the optometer, and produced by an insignificant pressure backwards of the macula.

The difference of level between the macula and the papilla, was easily measured by means of the refracting ophthalmoscope, by admitting that for each 3-10th millim. of lengthening of the eye, there was diminution of refraction equal to 1D.

The examination of the macula gave M=1D=1-36.

The vessels of the papilla gave, on the contrary, M=5D =1-7th.

There was then a difference of 4D between the refraction of these points of the retina.

1D equal 3-10ths of a millim.

4D equal 12-10ths of a millim.

Or nearly 1·3 millim., a figure which represents the depth of the excavation of the papilla. By examination of the macula, it may be seen, that the myopia of 1-36th is here the true myopia; by the process of the reversed image, the vessels of the papilla are alone considered, these vessels are the only elements really visible by means of the ophthalmoscopic mirror. In the case we have been considering, they were found to be placed behind the focus of the dioptric system of the eye at such a considerable distance as to induce belief in a case of myopia of 1-7th or 5D.

This observation has a double interest. It shows, firstly, how elastic is the term "physiological papilla," and secondly, that for the diagnosis of the anomalies of refraction, we must employ all the methods which we have at hand.

If, in the case in question, the process of the reversed image had alone been employed, a grave error would have been the result.

A CASE OF EXOPHTHALMIC GOITRE WITH REMARKS.

By BERNARD KELLY, M.D., L.K.Q.C.P.I., L.R.C.S. Edin.,
Medical Officer to the St. Olave's Union, Southwark.

In the present age, when the higher and more seductive branches of medical science, comprising chemistry, physiology, and histology, not to mention morbid anatomy or pathology, especially engross the leading minds of the profession, it is to be feared that the records of cases, such as are met with in general practice, do not attract that respect and attention to which their importance entitle them. Indeed, in presence of more brilliant productions, they, like the lesser lights of heavens, may be truly said to "pale their ineffectual fires." But, to prevent the intellectual appetite palling from over-indulgence in food so luscious, it is often highly beneficial to mix the bitter with the sweet; or, in other words, to combine the practical with the theoretical. Influenced by such motives, and deeming the following case of sufficient rarity and interest, I have ventured to sketch its most salient features; appending such comments as I thought would give it more perspicuity, and without which it might possibly appear meagre and imperfect.

E. D., æt. 18, single, sent for me Dec. 24th, 1877. She had not been regular for about seven months, although experiencing the *molimen menstruale* at the usual periods. She sought medical advice soon after the cessation of the menses for that trouble, as also for a swelling in the throat, which caused her considerable alarm, and created no little inconvenience in deglutition and breathing; but, as it would seem from her own account, without receiving any appreciable benefit for either, and was eventually obliged to give up her situation—that of a domestic servant—owing to the aggravation of her symptoms and increasing ill health. On examination the following condition was found:—A marked protrusion of the eyeballs, tumultuous and violent palpitations of the heart, area of precordial dulness increased, pulse 120, irregular, spasms of the diaphragm, of tonic character, recurring at intervals of every few minutes, which caused her intense agony, and which she compared to the feeling produced by a hard cord drawn tightly around the waist. The physical examination of the chest revealed nothing abnormal, save the palpitations and precordial dulness already referred to. There was marked hypertrophy of both lobes of the thyroid gland. The urine, as usually voided, was clear and abundant; and, on cooling, deposited no sediment. It was found, however, on examination, to contain a notable quantity of acid phosphates, but no albumen; specific gravity 1025. The bowels were constipated, the tongue moist and coated. There were constant movements or twitchings of the upper extremities, such as are seen in mild forms of chorea, and which gave the patient a very restless, fidgetty appearance. Owing to the intense pain arising from the tetanic action of the diaphragm, she had been unable to sleep for the last forty-eight hours; and was consequently in a very haggard miserable condition.

From a grouping of the foregoing symptoms it will not be difficult to diagnose here a case of Graves' disease, complicated with hysterical, choreic, and uterine disorders, and by a very unusual spasmodic affection of the midriff.

As it was most important, indeed of pressing necessity, to, first of all, assuage the patient's suffering, and thereby, if possible, procure some sleep, I prescribed the following:—bicarbonate of potash, compound tincture of lavender, of each two drachms; tincture of opium one drachm, and water to eight ounces, a sixth part to be taken every three hours. The patient was seen the following day. She had had some sleep during the interval. The diaphragmatic pains were not quite so frequent or acute. The palpitations and nervous twitchings were somewhat lessened. The mixture to be continued.

26th.—So far as physical suffering was concerned, the patient's condition was decidedly improved. She had slept well during the night, the pains had entirely gone; but she has been troubled with frequent and distressing hiccough which seems to supplant or supersede them. There is also intolerable pruritus of the whole body, but without eruption. There has been repeated vomiting of bilious matter. The urine still clear and copious. Anorexia persistent. Shooting pains in the eyeballs, which seem to the patient as though they were starting from their sockets. Pupils contracted. Bowels constipated. Pulse 108. Palpitations less severe. Ordered:—dilute sulphuric acid, two drachms; tincture of belladonna, a drachm and a-half; syrup of orange, a half ounce; and water to eight ounces; two tablespoonfuls to be taken every two hours.

27th.—The patient still making steady progress. Has had a good night's rest. The effects of the opium were still felt, she being quite drowsy, but the contraction of the pupils and the hyperæsthesia were considerably diminished. Pulse 140, irregular. Respiration normal. Urine limpid. Tongue moist, but slightly furred. Singultus entirely gone. Borborygmi (hysterical?) distinctly audible at quite a distance from the patient. Vision, as usual unimpaired, although her eyes ache from the slightest strain, as in reading, or looking intently at an object, if only for a few minutes. The following mixture was given: fœtid spirits of ammonia, two drachms; tincture of belladonna, a drachm and a-half; water to eight ounces; two tablespoonfuls to be taken every two hours.

28th.—Her general condition much improved. Choreic symptoms scarcely perceptible. Palpitations less troublesome. Pulse 100. Respiration quiet. The bowels have been moved. Urine normal in quantity, but becomes turbid on cooling owing to the presence of alkaline phosphates. The patient has had very little sleep during the night, which was, doubtless, due to the sudden withdrawal of the opium, and its substitution by tincture of belladonna, as the patient was quite free from pain and other distressing symptoms. The following mixture was therefore clearly indicated:—dilute sulphuric acid, two drachms; tincture of opium, half a drachm; syrup of orange and water to eight ounces; two tablespoonfuls to be taken every three hours.

From this date her convalescence was so rapid and satisfactory that I ceased my visits, the patient being able to come to my residence till the catamenia made their appearance, which happy event unexpectedly occurred, for the first time in eight months, on the 30th of January last. And, although the discharge was rather scent, and of brief duration—not lasting quite three days—still the moral effect of its return—the barrier, as

it were, being broken down—had a most beneficial influence upon her spirits and general condition. To produce this result, no emmenagogues were employed. Indeed, I purposely withheld them; my object being, for the present, to support the patient's strength; and for that purpose the remedies used were simple bitters and neurosthenic agents, such as bark, mineral acids, valerian, assafœtida, &c. The bronchocele and buphthalmia still remain; but neither, as it seems to me, at all so prominent, or well-marked. The palpitations have entirely disappeared; but some slight irregularity and quickness of the heart's action are yet perceptible.

There are many points of clinical interest in this case; both as regards its mode of origin, its complications, and the facility with which the more urgent symptoms yielded to treatment. The patient herself dates all her sufferings from the temporary menopause, as she neither had exophthalmos, cardiac trouble, nor enlargement of the thyroid prior to that period. It would, therefore, be highly important to ascertain how many cases of Graves' disease depend upon, or, at least, have their apparent starting point, like the present, from sudden and premature arrest of the menses.

Then, as to the treatment. Reasoning from their effects upon glandular affections in other parts of the body, medical men almost invariably—indeed, I might say instinctively—resort to the topical use of iodine for goitre, and give internally the iodides of potassium and iron, with a view to produce its resolution or absorption. Nor do I say this disparagingly, as I myself must plead guilty to the same charge, having long adopted a similar line of treatment, and only relinquished it when hard experience taught me better. But the analogy between bronchocele and other adenoid disorders exists more in appearance than in reality. For, whereas the former is generally a disease of young females, and endemic, or limited to the inhabitants of certain mountainous regions—an observation as old as the time of Juvenal, who asks the question: "Quis miratur tumidum guttur in Alpibus?"—the latter are widespread, and not peculiar to any sex, race, clime, or nationality. The natural tendency, moreover, of ordinary strumous enlargements of the glands is, when left to themselves, to suppurate, or end in cheesy metamorphosis and ulceration, whereas goitre, so far as I am aware, rarely, if ever, shows any such disposition, but keeps steadily increasing till life is jeopardised, and extirpation resorted to, or, having attained a certain size, remains stationary, and becomes an unsightly, but comparatively harmless, appendage of the individual for the remainder of his or her days. The transformations, moreover, which it undergoes, if we except cysts and hydatids, are usually of a fibrous, lardaceous, cartilaginous, and osseous character. Hence the treatment which proves efficacious in the former, is found from bitter experience to be all but utterly fruitless, unless in the few exceptional cases, in the latter.

Functional derangements of the uterus not unfrequently lead to hypertrophy of the mammæ, thyroid, and tonsils. These affections, however, must not be considered scrofulous in any sense of the term, as they never suppurate, soften, or ulcerate, but are purely sympathetic, and disappear, gradually or suddenly, as the cause which evoked them has been removed. May it not be so eventually with the case under consideration? Indeed, judging from present appearances, as indicated by the patient's freedom, from suffering, her cheerfulness, the complete subsidence of the cardiac erethism, and the restoration of the catamenia, there is some reason to hope that the enlarged thyroid and exophthalmos, if not entirely disappearing, will at least remain in their present painless, passive, and sensibly reduced condition.

The girl being obliged to provide herself with a situation, I unfortunately lost sight of her ever since; but her non-appearance I take as a favourable omen of the progressive improvement of the case, for were she at all affected in anything like the manner as when first she came under my care, the great probability is that she would have consulted me again.

P.S.—Since writing the above, her mother called on June the 18th and told me, with much pleasure, that her daughter was "doing first-rate," that "everything" was going on to her satisfaction, and that she had not had a single day's ill health since I last saw her.

Clinical Records.

GUY'S HOSPITAL.

A Case of Charbon.

(Under the care of Mr. COOPER FORSTER.)

A. P———, æt. 17, admitted June 18, first came to surgery complaining of a sore arm. On examination, about the middle of the front of the left forearm, there was a sore about the size of a shilling-piece with a central black spot, surrounded by a yellowish transparent circle, around which the skin was much inflamed, the inflammation extending nearly to the wrist and about half up the arm, but each way confined to the *front* of the arm. He said he was a tanner and had worked with fresh calves' hides, English and foreign, the week before, and had a pimple then where the sore was. On Sunday, the 16th, the arm being much swollen and very painful, he applied poultices till Tuesday morning, the 18th, when he applied at the surgery for treatment. He was at once taken into Cornelius Ward, and about 3 p.m., put under chloroform, when Mr. Cooper Forster removed a piece of skin and subcutaneous tissue about the size of a 5*d.* piece. One gland in the left axilla was enlarged. Temperature before the operation was 101·2°, but afterwards soon fell to 95·5°. On the evenings of the 19th and 20th it rose to 98·8°., but has since been normal. The gland in the axilla has regained its normal size. The wound has been dressed antiseptically and is granulating up very nicely.

The patient has since left the hospital in good health.

A Case of Carbolic Poisoning.

Thomas L———, æt. 57, a labourer, was brought into the surgery insensible on the afternoon of the 27th ult. by two men, who said he had swallowed some carbolic acid, but did not know what strength the solution was. The house-physician immediately gave an emetic of 25 grs. zinc sulphate, after which the patient vomited freely and recovered sufficiently to walk to the clinical ward with the assistance of two men. His tongue and mouth when first seen were quite white, and there was a large white patch extending from mouth to chin. At night he complained of sore-throat, but was well otherwise. Olive-oil was applied locally and mist. mucilag., ℥j. 4 tis horis given internally.

June 28.—Patient passed a good night; only complains of sore throat. Urine dark, clear, faintly acid; no albumen; sp. gr., 1040. Dr. Stevenson reports the amount of carbolic acid actually found in the urine to be very large. A specimen of the acid drank was sent to the hospital, and on examination proved to be an 80 per cent. solution.

June 29.—Throat sore, fauces covered with white patches; tongue corrugated; bowels open; appetite good. Says he feels quite well. Left hospital this afternoon.

THE rates of mortality in the four principal cities of the United Kingdom last week were in Edinburgh 19, London 22, Glasgow 22, and Dublin 25 per 1,000 of the population. The highest rate in the other large towns was reached by Leicester, 30; the lowest by Brighton, with 13 per 1,000.

THE VOLUNTEER MEDICAL SERVICE.

THE programme of the Volunteer Ambulance Department commends itself to all who take an interest in the movement, and we have pleasure in lending our assistance by giving it the publicity of our wide circle of readers.

Seeing that the Army Medical Department is organised on a scale not large enough for the wants of Her Majesty's regular troops, it is wholly needless to point out that the volunteer force, if called upon for active service in its present state, would take the field without any provision for its sick and wounded. This grave defect the Volunteer Ambulance Department seeks to remedy, relying with firmness upon the patriotism and devotion of those for whose help it appeals, and whose interest it aims to serve.

To attain the object of the department men and money are required.

As regards men, it is requisite that the medical officers of volunteer corps should go through a course of training to enable them to act as instructors at their several head-quarters, and that at least two men per company should be told off and fitted for ambulance work in the field. Already important steps have been taken in the metropolis with the sanction and help of the Army Medical Department. Under the direction of Surgeon-Major Staples, A.M.D., a considerable number of medical officers have qualified themselves for the work of instruction; two classes of non-commissioned officers and men, numbering 266, have passed with great success through this course of training in elementary anatomy, bandaging, application of tourniquets, and first dressing of wounded, stretcher drill, loading and unloading of ambulance wagons, and the various methods of carrying sick and wounded; while a third class of 100 men is now engaged upon these important duties under the instruction of Surgeon Platt. The classes of instruction are held in the Riding School, Albany Street Barracks, on Friday evenings, at 7.30 p.m. A beginning having thus been made, the Volunteer Ambulance Department seeks to spread the movement over the entire country, so as to meet the requirements of every corps in the service.

It is hoped eventually to organise a hospital corps in connection with the department, whose duty would be to take charge of wounded men brought to the rear. No doubt is entertained that, if appealed to, the surgeons and students of the metropolitan and provincial hospitals would come forward in numbers sufficient for a work which honours alike the patriotism and humanity of those who share in it.

With regard to money, it must be obvious that, in the absence of pecuniary aid from Government, funds will be required not only to meet the incidental expenses of the department, but for the purchase of material. It is proposed, therefore, that individual volunteers, wishing to go through a course of instruction, should pay a fee of 5s. But it is hoped that commanding officers generally, recognising the absolute need for such an organisation, will, by a subscription from the regimental funds, secure to their respective corps the necessary training.

We have much pleasure in announcing that H.R.H. the Duke of Cambridge has graciously consented to be Patron of the Association, and that the Presidency has been accepted by Surgeon-General Munro, C.B., A.M.D. The high official sanction thus accorded to the movement cannot but have the best possible influence upon its successful working.

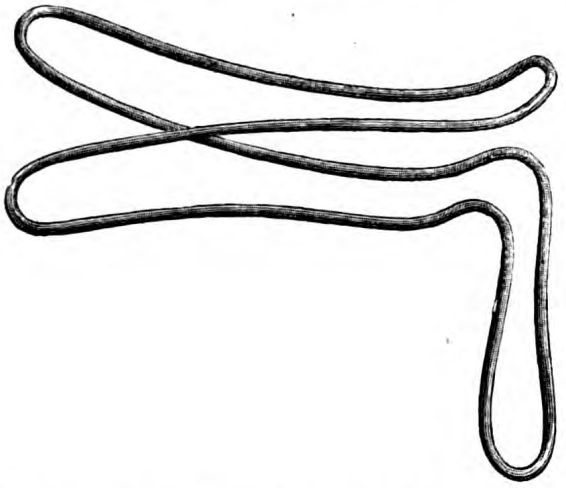
The synopsis of lectures for the guidance of the medical officers of the volunteer force is well arranged, and we trust provincial corps will respond to the patriotic appeal of the metropolitan executive. There are in the provinces volunteer surgeons of ability, and who are interested in their work, so that we apprehend there will be no difficulty in extending the scheme.

Courses of lectures might be arranged for certain districts at some of the large centres, as Manchester, Liverpool, Birmingham, Sheffield, Leeds, Bristol, &c., so that the instruction would be carried on without too great a sacrifice of time and money involved by a visit to London. The lecture-programme, as framed by Surgeon-Major Staples, A.M.D., must be of the greatest assistance to all intending lecturers, who will do well to follow the suggestions therein given. Space prevents our giving it in detail, but any of our readers interested in the matter will be able to obtain copies on application to the office of the Association, 8 Northumberland Street, Strand, or to Surgeon-Major Staples, Woolwich.

Novelties.

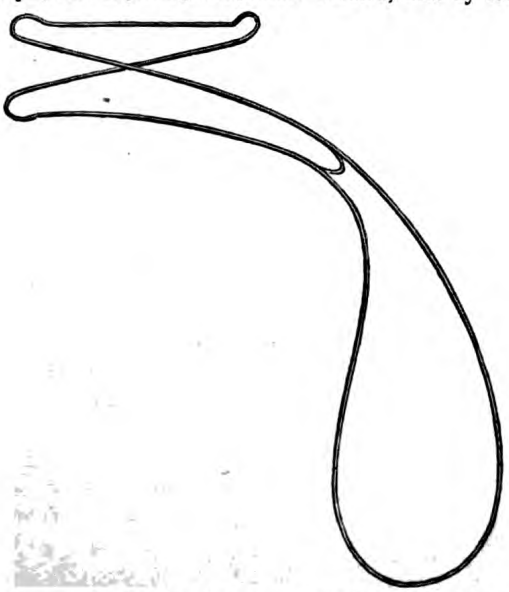
A RECTAL SPECULUM, AND A FEMALE URETHRAL SPECULUM.

AT a recent meeting of the Cumberland Co. Med Society, at Portland, U.S., Dr. George F. French exhibited a modification of Dowell's vaginal speculum adapted to use in the rectum.



The instrument is made of steel wire, of sufficient flexibility to allow the sides to approximate at their ends, when introduced, and with rigidity enough to retain its shape. There is a slight constriction near the handle, for the sphincter ani to grasp, and a lateral flaring of the blades which effectually prevents the instrument from slipping out of the rectum, even after the sphincter has been ruptured. This speculum is equally well adapted for use in the vagina and has the advantage over other vaginal wire-specula of being *self retaining*. The handle can be so deflected as to bring the upper, lower, or either side of the rectum into view for mere inspection or operative procedure. The smallest size is an efficient endoscope; can be introduced without discomfort to the patient, and is suitable for ordinary office use; the largest size requires anæsthesia, involves rupture or extreme dilatation of the sphincter, and has been found particularly serviceable in quilting a hæmorrhoidal surface too rotten to be dragged outside and ligated.

Dr. French has also devised another speculum, on the same principle, for exploring the *female urethra*, and by simply



straightening the handle, it becomes equally serviceable as an endoscope for the dilated *cervix uteri*; in both cases its utility will be enhanced by the aid of a concave mirror.

REGISTERED FOR TRANSMISSION ABROAD.

SPELLING REFORM.

SPELLING REFORM is a subject to which no one connected with the press, or interested in literature, can be wholly indifferent. A distinguished physician has taken a prominent part in the agitation that has prevailed in some quarters in favour of simplifying English spelling, and there has been some correspondence on the subject in the columns of this journal. We shall, therefore, venture to give our views of a question on which there is certainly a great difference of opinion.

Several attempts have been made from time to time to remove some of the imperfections and inconsistencies of English orthography. Many of us may recollect that several years ago a newspaper was published in which every word was spelt on the phonetic principle. It did not, however, take with the public, and soon died a natural death. Even as far back as 1711 Jonathan Swift invited the Government to appoint a commission with the view of "ascertaining, correcting, and improving the English tongue," and since his time various suggestions have been made on the subject. There is one scheme which has been called the "alphabetic" system, as it mainly proposes to change the number of letters in the alphabet, increasing them from 26 to about 40, on the ground that some of the letters of the alphabet have to do duty for four or five distinct sounds. The objections, however, to this scheme are so grave that it is never likely to be carried out. Independently of the fact that the already educated portion of the community would have to learn a new and complex alphabet, the introduction of such a scheme would render the priceless English literature of the last 300 years of no avail to future generations, as every book printed before the introduction of the new alphabet would appear to them to be written in an unknown tongue. A paragraph printed in conformity with this scheme has a strange appearance, similar to that presented on attempting to read for the first time a book upside down. Another or phonetic scheme of spelling, which aims at spelling every word as it is pronounced, has many advocates. It is not a new one, for Dr. Harley informs us that there is in the British Museum a book published in London in 1619 recommending the adoption of a system of phonetic English spelling. But the general adoption of such a system is almost impracticable from the fact that what is phonetic in one country, or at one period, is not phonetic in another country or at another period. As the above physician remarks, the pronunciation of English words is not uniform even among educated classes. As, therefore, this pronunciation varies from generation to generation, and in different localities, phonetic spelling can never be stereotyped. Besides, there are few people who have such a correct ear as to be able to appreciate the nicer distinctions of sounds, and still fewer who, in the case of any given words, would be found to agree as to the most appropriate letters by which those words should be spelt phonetically. Consequently, we cannot be surprised that even those who have given their special attention to phonetic spelling are not able to spell similarly on phonetic principles from their possessing differently constituted ears, or that some supporters of this system have carried it out in a manner that could never meet with general acceptance. Such a sentence as the following in which "the" is spelt "dhi," is quite enough to prevent any one being captivated with phonetic spelling:—"Konsikwentli dhi unfamilyer kombinaishenz aur koloakaishenz ov familyer kombinaishenz at wuns point out diferensez to bee atended too." There are other schemes of spelling reform which are founded on more philosophic principles than that last mentioned, neither meditating a change in the number of letters in the alphabet, nor making any attempt to render the spelling of every word absolutely phonetic. These we cannot now notice, as our purpose is chiefly to draw attention to the system advocated by Prof. George Harley, of University College, and which he has recently expounded in two pamphlets on the subject, entitled respectively, "The Simplification of English Spelling" and "Rational Spelling: a Conservative Scheme for National Spelling Reform." This scheme, which is stated to be "solely founded on the basis of natural linguistic evolution and philosophic simplification," is divided into three parts which may either be adopted and worked out separately or conjointly. The first part proposes to abolish the use of duplicated consonants from every word in the language, except personal names. The second part proposes the abolition of all mute letters, be they vowels or consonants. The third and last part proposes (1) to spell all words with the fewest possible number of letters capable of furnishing a correct index to the pronunciation of the word; (2) to spell all similar vocal sounds with exactly the same letters of the alphabet; and (3) to abolish the employment of similar letters of the alphabet to denote unlike

vocal sounds. Dr. Harley has at present only fully unfolded the first part of his scheme, but our criticism will not be confined to that part, but will extend to the other suggestions he has made upon the subject.

With regard to the abolition of all duplicated consonants and of mute letters, his reasons for advocating this scheme are :—That the omission of duplicated consonants necessitates no re-education whatever ; that the omission of letters will entail no mental effort upon any one ; that it will at once lead to a considerable saving of *time* and *labour* in writing, printing, and reading ; that it will diminish expence by saving, not only time, but materials, as paper, pens, ink, &c. ; that this scheme of omitting letters can easily proceed side by side and hand-in-hand with the present method of writing and printing ; that the proposed reform would not interfere with the value of existing libraries and literature, which the adoption of the Congress scheme of reform would do ; that it offers a personal advantage to every man, woman, and child, and will be an equal boon to the lazy, as well as to the busy, members of the community ; and that it would be a stepping-stone to still more radical changes in English orthography, such as that meditated by the Spelling Reform Congress. Moreover, a century or two ago, a number of words were spelt with duplicated consonants which are, at the present day, spelt only with single ones, and if so many duplicated consonants have been expunged with apparent advantage, why are any retained at all ? The omission of these consonants will rarely tend to induce a change in the pronunciation of the words from which they are omitted ; whilst with the abolition of duplicated consonants would be annihilated all the rules, with their fetters of exceptions, which so perplex our children. Few persons, remarks Dr. Harley, have the slightest conception of the enormous number of duplicated consonants which infest English words. No fewer than *thirty thousand* of these consonants appear in every full-sized copy of the daily *Times*, one-half of which are totally useless. It is also a remarkable fact, of which we were not before aware, that "the number of duplicated consonants employed by any English writer stands in a direct inverse ratio to his literary talents." We trust, therefore, our readers will be so good as *not* to count the number of duplicated consonants in this or any of our leaders, for fear of the MEDICAL PRESS AND CIRCULAR losing its reputation by such an examination.

In short, says Dr. Harley, the employment of duplicated consonants "cannot be logically defended either on philosophical or on philological grounds." How far he is right, and what rational objections may be made to his scheme of spelling reform we must reserve for future consideration. In our next issue we hope to return to the subject, but, in concluding this article, we may remark that the zeal and ability which Dr. Harley has shown in advocating his method of simplifying English spelling entitles him to a respectful hearing from every one who is interested in the improvement of the English language.

THE LONDON TEMPERANCE HOSPITAL.

WHATEVER claims this hospital may have upon the patronage of the public in virtue of the total abstinence principles on which it is conducted, it is certainly, from a business point of view, a success. Contributors have been increasing, instead of falling off ; and a new hospital is in course of construction, which, when completed, will accommodate 100 in-patients, and a large number of out-patients. The Fifth Annual Report for the year ending April 30th, 1878, has just been published, from which we learn that during that period, 130 in-patients, and 1,272 out-patients were under treatment. We are also told that "the medical and surgical cases of a severe and serious type have been quite equal to the average proportion in other hospitals, and such as according to traditional usage would have been treated with a liberal supply of alcoholic liquors ; but the absence of these has not been considered by the visiting physicians to have been attended with any disadvantage, but to have conduced to recovery, or to an abatement of disease." We remarked on a former occasion that the practice at the London Temperance Hospital may be regarded as an experiment, but *not* as a very logical one, or as an experiment conducted on scientific principles, and free from the fallacies which are inseparable from mere statistical, or otherwise loose, methods of observation. That the mortality is much the same, or even less at this hospital than at other hospitals, and that the diseases there treated appear to run much the same course, and to get on as well without alcohol as with it, is no proof that alcoholic stimulants should for the future be wholly dispensed with in the treatment of disease. The personal feelings and comfort of the patient while under treatment, the temporary relief given from some distressing symptom, or the support afforded under certain trying affections, physical or mental, have also to be taken into account. The judicious administration of a little alcoholic stimulants may not save the patient's life, or even shorten the disease, but when it has done neither the one nor the other, how often have we seen some pain or ache entirely removed, or the flagging pulse invigorated, or the drooping spirits revived, or some unbearable affliction made more bearable by the timely administration of a little wine. The daily experience of the physicians of this hospital, shows them that they *can* do *without* alcohol, but their daily experience will not show them how much they might do *with* it. The experiment which they are trying is almost entirely of a negative nature. It is certain that the medicinal use of alcohol, must either do good or harm. If good there is at this hospital no opportunity of showing it, if harm, it is, for the same obvious reason, impossible to know it. It is only by contrasting a large number of similar cases, or similar symptoms, treated some with and some without alcohol, that any reliable results could be obtained. The syllogism of their argument, and of the cases cited it the last Report, is, that certain diseases were of a severe nature, nevertheless they got well under the non-alcoholic treatment ; therefore the administration of alcohol would not have done any good.

At the same time we shall not deny that the practice of this hospital will be the means of correcting many erroneous opinions that are still prevalent with regard to the use of alcoholic stimulants in the treatment of disease. No doubt these stimulants have been greatly abused, and an enormous amount of money spent on them that would have been better laid out in other ways. Just as homœo-

pathy has done some good by putting a check upon the wholesale drugging and polypharmacy of the old apothecaries, so perhaps will the example set by the London Temperance Hospital induce the profession and our several Hospital and Infirmary authorities to be more careful and discriminating in their prescription or distribution of alcoholic stimulants. In fact, both the dietetic and medicinal use of alcohol has been so much abused, and has been fostered by such conventional and routine principles, that we are not surprised to hear that many public institutions find that they can very well do with a much less supply of spirits and wines than they formerly did. Thus in the case of Wandsworth and Clapham Union Infirmary, the ounces of distilled spirits given in one week in 1877, amounted to 1,340, but fell to 320 in one week in 1878. The pints of porter and ale also given in the same week, sank from 998 in 1877 to 658 in 1878. Nevertheless, we are fully persuaded that neither the London Temperance Hospital nor any other theatre of observation and experiment will ever prove that there are no circumstances, or diseases, or symptoms, in which even a moderate allowance of diluted spirit or wine is at all necessary. We have watched by the bedside of too many patients, and too frequently witnessed the good effects of these stimulants in certain cases to allow our judgment to be unduly biassed by the one-sided practice and imperfect observation afforded by the Temperance Hospital. By all means in our power let us try to check the deplorable intemperance so prevalent in this country; by all means encourage the habit of not prescribing for patients one drop more wine or spirit than the occasion and a matured experience justify. At the same time will not the truth be found in some happy medium between the practice of such physicians as the late Dr. Todd, in the wards of King's College Hospital, and that of the medical staff of the London Temperance Hospital. We will even go further, and say that the time will come when, either for dietetic or medicinal purposes, a very small quantity of alcohol will be consumed by the community compared with the enormous quantity that is now retailed out to all classes of society. So far, therefore, as this hospital may help in checking the prevailing intemperance, and the general abuse of alcoholic liquors, whether given as a medicine, or taken as an agreeable stimulant, we shall wish it every success, and shall not venture to disturb the self-complaceny of its physicians when they think of the admirable example they are setting the rest of the profession, and of the inestimable advantages enjoyed by their patients.

Notes on Current Topics.

The Dental Practitioners' Bill.

This Bill has passed into law, and in consequence of the extraordinary inactivity of the qualified dental surgeons every druggist in the kingdom, and a multitude of jewellers' apprentices and other mechanics, who have turned their attention to the art of vulcanising india-rubber, will be placed on the medical register as officially-recognised dental surgeons. As a matter of law, no one of the new class of registered medical practitioners need have even the minutest knowledge of either surgical or mechanical dentistry; and, as a matter of fact, three-fourths of those who will be registered will be utterly and ridiculously ignorant of the elements of the profession which they are authorised to practise. This may appear a strong assertion, but we defy the promoters of the Bill to say that it is not the truth; and we say further, that the qualified dental surgeons, on whom lay the onus of preventing such a legislative *fiasco*, are the persons on whom the blame lies. It has been said that no great harm has been done by permitting unqualified persons to do legally that which they have been doing, and will continue to do without permission, and that, inasmuch as druggists and mechanics have been practising dentistry without hindrance, there can be no ill result from enabling them to do so by law. But the persons who argue thus forget that there is a wide difference between tolerating quack practice because we cannot prevent it, and recognising and patronising such practice. Hitherto druggists and such people have practised dental surgery under the shade of illegitimacy, being obliged to admit that they never learned the business, and could give no evidence of competency. Henceforth, these gentry are formally stamped with the Government cypher, recorded in the official lists as of recognised competency, and entitled to advertise themselves all the world over as being qualified, according to law, to perform dental operations. This Bill, which purported to be constructed for the protection of the public, and to enable them to distinguish between competent and incompetent practitioners, has done exactly the reverse, for it has deprived the public of the only means of judging, and has lifted into the rank of recognised competency a multitude of small tradesmen and artisans who are actually as ignorant of dentistry or surgery, and as dangerous in practice as would be the printer who composes these lines.

However, the Bill is law, and the moment has come to initiate proceedings under it. The Colleges of Surgeons of Ireland and Scotland and the Glasgow Faculty will, we presume, proceed at once to avail themselves of the powers given them by the Bill to appoint examiners and establish a license in dental surgery. The more disreputable the position of a registered dental practitioner has been made, the more anxious will all respectable dentists be to separate themselves from the herd of oilmen who will appear on the official list, and we anticipate, therefore, that there will be a rush, for dental licenses. We earnestly hope that the Colleges will not yield to the temptation to sell their dental licenses at too cheap an educational rate. In the case of senior men of respectability and standing a relaxation of examination may and ought to be made, but in the case of young and unknown men a fair comprehensive knowledge of dental surgery ought certainly to be required. We suggest that a modified examination might be permitted in the case of a candidate who—1. Has been, say, fifteen years in practice. 2. Can be certified as of high moral and professional character by, say, six licentiates in dentistry, members of the medical profession or members of a dental society of repute. 3. Shall sign a declaration that he has not for two years past advertised or used any other illegitimate means to practice, and will not do so in future.

It behoves the Colleges in question to keep up the prestige of the dental licenses when these diplomas are formed; for it must be recollected that such licenses are nothing but honorary distinctions, and confer no privilege whatever which the existing dentists do not already possess; and if these licenses be degraded to a low standard they will be neither necessary nor attractive to candidates.

Chloride of Ammonium in the Treatment of Hepatic Disease.

In a communication to the *Philadelphia Medical Times*, Dr. William Stewart calls the attention of the profession to the value of chloride of ammonium in the treatment of hepatic congestion and tropical hepatitis. In this country the chloride of ammonium has not obtained the reputation it apparently deserves as a therapeutic agent, and consequently it is rarely prescribed internally either in disease of the liver or any other disease. The dose necessary for its full therapeutic effect is gr. xx., and the only condition which contra-indicates its use in hepatitis is a hot and dry skin. Under such circumstances its use should not be commenced till the skin is rendered moist and perspirable by the administration of some simple diaphoretic mixture. Soon after taking the medicine there is a sensation of warmth in the epigastrium, which gradually extends to the abdomen, and over the entire cutaneous surface. The patient feels "light-headed," the pain in right hypochondrium is greatly alleviated, and a free and equable perspiration takes place and lasts for one or two hours. With the next dose similar effects will be observed, and with each succeeding one the interval will gradually become longer, till at length the relief becomes complete and constant. Moreover, after several doses of the medicine, the urine is much increased in quantity, is limpid, and passed without uneasiness, and after a few days the appetite is much improved. Dr. Stewart also mentions several anomalous symptoms, produced by the drug, which are peculiar and directly referable to the liver, such as a "shock," or as if "something gave way" in the side, or a feeling of "pulling," "pricking," "gnawing," &c. In primary acute hepatitis the chloride of ammonium treatment may be preceded by a mild purgative, diaphoretics, fomentations or poultices to the side, and, in some cases, a few leeches to the side. In congestion of the liver, in chronic hepatitis, and in "torpor of the liver," Dr. Stewart speaks from a large experience, of the great efficacy of this medicine, and several cases which he has fully reported appear to bear out the good opinion he has of the drug in the treatment of hepatic disease.

A Flaw in the Adulteration Act.

A very important and somewhat disastrous judgment was delivered last week in the case of Sandes *v.* Small by the English Court of Queen's Bench on an appeal from the decision of the magistrates by an inspector under the Adulteration Act.

The defendant had sold grog for whiskey, and the fact was proved, but he pleaded that there was a public notice exhibited in the house, "All spirits sold here are mixed" (sec. 38 and 39 Vic., cap. 63), not stating with what proportion of water it was mixed; and further, that the purchase was not for the benefit of the inspector, but only for analysis, and that, therefore, the purchaser was not prejudiced within the meaning of the Act.

The Lord Chief Justice pointed out that as the inspector had purchased only for analysis, and had consumed no part of it, he had not been prejudiced. It was urged that if it were so, sec. 13 of the Act was entirely nugatory, as it applied only to purchases by officers and others for analysis. The Lord Chief Justice said he quite agreed in that view, and was disposed to think that the enactment was nugatory. It is of the essence of the offence that the purchaser should be prejudiced; and how is he "prejudiced" if he purchases only for analysis.

The Court dismissed the appeal.

This is, as we have said, a very serious judgment, for it amounts almost to a repeal of the Adulteration Act. Ninety-nine hundredths of all the the cases in which prosecutions are instituted are under the initiative of inspectors, who buy samples for analysis and are, according to this judgment, not personally prejudiced by the fraud. We shall be anxious to see whether the difficulty can be got over without a new Act.

Insanity in Ireland.

According to the Report of the Inspectors of Irish Asylums, which has just been issued, it appears that the difference between the year 1876 and 1877 as regards the number of the accommodated insane of all classes was only 257, the excess being in 1877, the sane being to the insane at present in the ratio of 420 to one in the general population. There is, however, an important element of consideration, not to be over-looked in regard to the prevalence of mental affections—namely, the reputed insane at large; who amount under all denominations to 6,626. This total, calculated as in the preceding case, would be proportionally as 817 to one in the community at large. It should, however, be borne in mind that these returns, made out on both occasions by the constabulary cannot be accepted as conclusive, as the collectors, though otherwise highly intelligent, must, from their non-professional character, have relied in great measure on hearsay or common report.

To arrive at a more definite knowledge on this subject we purpose seeking, through the Local Government Board, returns from the dispensary physicians in the unions comprised within two or three asylum districts, of the insane at large, by name, with the nature of their maladies, so as to compare them with those we have otheawise obtained. Of 9,626 at large, and of all grades, 1,964 are set down as belonging to the middle and upper classes, leaving only 4,662, who under any circumstances, could become chargeable to the public rates.

Between both sexes 10,387 lunatics had been under treatment within the twelvemonth. Of these 1,076 were discharged cured, and 249 improved, constituting between both categories a total of 1,325, or a per-centage of beneficial results on admissions of 57—which may be fairly regarded as most satisfactory.

Dr. Turrell, medical officer of health for Windsor, was fined last week at the Bucks Assizes, £100 for taking under his care an insane lady without complying with the provisions of the Lunacy Act.

Another Death from Rabies.

Last week an inquest was held by the Manchester coroner touching the death of Francis Archibold, aged 23, a labourer. According to the evidence of the wife, deceased came home about three months previously, and said he had been bitten by a dog. He showed her his left thumb, which was red, and which bore a few little marks like teeth-marks. He took no further notice of the occurrence but for the last fortnight he had been "heavy." On Friday he went to his work as usual, and in coming home in the evening said he felt sick and unwell. He passed a restless night, and having partaken of some water, which made him shiver, he could eat nothing, and could not afterwards bear the mention of water. She then sent for medical assistance, and on Sunday week deceased was moved to the Manchester Royal Infirmary. Previous to that, however, when Mr. Daly tried to give him medicine, he got out of bed and ran into the back kitchen. He seemed to wish to drink but could not. After the doctor had made him take medicine he seemed in great agony. The deceased had been a heavy drinker, of beer chiefly, but he had not been the worse for drink for a fortnight.

Mr. F. A. Southam, Resident Surgeon at the Royal Infirmary, said the deceased was brought to that institution about three o'clock on Sunday afternoon, and died three or four days afterwards. Ten or twelve surgeons connected with the Infirmary saw deceased during that time, and all were satisfied that it was a well-marked case of hydrophobia. He was quite unable to swallow, and every attempt to do so brought on a violent spasm. He complained of great thirst, but when drink was brought to him he could not touch it. Everything was done for him, but in vain. The symptoms usually exhibited themselves in six weeks. The jury returned a verdict of death from hydrophobia from the bite of a dog.

Poor-Law Election Amenities in Ireland.

In referring last week to the great need of reform of the system under which Irish Poor-law medical officers are granted superannuation, and to the inexpediency of entrusting Poor-law guardians with the arbitration in such cases, we argued that the guardians were unfit for such discretion because, as every one knows, political or religious views and personal popularity are, with them, of infinitely superior importance to the merit or suitability of a medical officer. In illustration of the extent to which feeling on these matters is occasionally carried in Irish Poor-law elections we quote the following narrative from the local papers of the last election to a county Tipperary dispensary :—

"The election of a medical officer for Oola Dispensary, in the New Pallas district, took place yesterday, the candidates being Dr. Ryan, of Newtown, and Dr. Ryan, of Scarteen, the latter being elected by a majority of four. In consequence of communications made to the police authorities, a large force of constabulary, three companies of the 82nd Regiment, and two troops of the 2nd Dragoon Guards were sent by early train to New Pallas. This movement is explained by the fact that about nine years ago a similar election was held at Murroe, in the same district, when a dreadful riot occurred, an attack having been made on the friends of one of the candidates, and a head-constable so seriously injured by a fracture that he retired from the force on pension. Fortunately no repetition of these scenes occurred, the election having been conducted quietly throughout."

There are, we hope, few districts in Ireland where such a scene as this could be enacted, but we assert that the same feelings dominate in almost every board of guardians and every dispensary committee in Ireland, and, for this reason, it is manifestly absurd to make the members of such boards the judges of any matter which affects the position of the medical officer.

Jubilee Meeting of the West Riding Medical Charitable Society.

The 50th annual meeting of this admirable society will be held at the Medical School, Leeds, to-morrow (Thursday) and we congratulate the promoters on its reaching the ripe age of 50 years. The chair will be taken at 3 p.m. by Dr. Chadwick, who has been most indefatigable in his exertions to promote its usefulness. The necessity of supporting this charity does not require pointing out, every medical man in the West Riding should be a member of it, for if in affluent circumstances the small subscription of £1 1s. will not be missed, and if dependent on private practice and on health for a living, the subscription will be well bestowed as a species of insurance for days of adversity. Sickness may come at any time. This is a truism only too well-known to medical men. Though a local society, we notice with pleasure the liberal spirit which characterises it, instanced by the following extract from to-morrow's programme :—

At this meeting the following proposals will be made, of which due notice has been given :—

1st. That in order, specially, to mark the occurrence of the Jubilee Meeting of the Society, and in consideration of the prosperous state of our funds, a wider scope be in future given to our charitable operations.

2nd. That, with this object, at each Annual Meeting a Committee, consisting of the President of the year, the Secretary and Treasurer, the senior Vice-President, and the senior Steward, shall be appointed, to whom shall be entrusted a sum of not more than two-thirds of the surplus income of the Society, from all sources except legacies, during the previous year.

3rd. That this Committee shall, in its discretion, disburse these funds to such needy objects as, not being Members, cannot be relieved by the Society, but who are otherwise qualified to receive its benefits ; or in aid of such Societies as are established for the relief of distressed medical men or their families, and which they believe deserve support.

4th. That in all such disbursements, the Committee give a preference to such applicants as have been professionally connected with the West Riding of the County of York, or in case of any Society, require the Manager of the same to give a similar preference.

Age, Sex, and Condition as Factors in the Production of Insanity.

This interesting question is the subject of some valuable remarks by the Inspectors of Irish Lunatic Asylums in their last report. They have found that—though in the population females are in excess by nearly 2½ per cent., their number in lunatic asylums is 8 per cent. less than that of males. With respect to the assigned causes of mental affections under the comprehensive headings, *physical and moral*, they are, respectively, 1,952, and 1,583, the former predominating to a notable degree among men—1,257, as against women, 695. The reverse, but not by any means

to an equal extent, obtains in regard to moral causes, 707 cases of the disease being attributable to such in males, and 876 in females, who, by nature excitable, are more subject to sensational impressions.

Between the years of twenty and forty, a period when the mental and bodily faculties are in full development, lunacy appears to be far more prevalent than in any other like portion of life ; 1,211 patients, or more than half of those admitted in the past twelvemonth becoming deranged within that term. On the other hand, from the then greater recuperative power of the constitution, recoveries are more numerous—568 being sent out cured.

In our last report we referred to the marked disparity existing between the married and unmarried inmates of Irish Asylums, public as well as private, one totally at variance with what is elsewhere recognised—the married and widowed according to present returns before us, amounting between both sexes to only 2,355, the single to 5,491. If lunacy was a malady of early life, or one prior to puberty, or was marriage in this country an institution of advanced life, some explanatory reasons might be available, but facts are quite to the contrary.

As to intemperance and irregularity of life, which would seem to be three-fold greater among males than females, on the aggregate of 693 patients whose insanity is entered as referable to their combined influences in one of the tables, it is difficult to say how much of it can be absolutely attributed to drunkenness; dissipation, and a continued indulgence in alcoholic drinks run so closely into each other as cause and effect—both leading from vice to crime. From our own personal observation, we question whether genuine lunacy, or *that* standing the legal, and, as a rule, the proper test of delusion, is so largely the result of intemperance as is considered ; no doubt, as an exciting cause, when a predisposition to mental disorder exists, intemperance is one of the most pressing, and if indulged in by patients after recovery, certain to produce relapses. The specific disease of delirium tremens, unknown almost amongst the most depraved of women, is more properly the consequence of confirmed drunkenness with men ; while common to both sexes, whose offspring may be doomed to the penalty of idiotcy, epilepsy, physical malformations, or paralysis and fatuity—individuals of either sex so affected and too frequently received into asylums, entail an extra charge on the community, and occupy beds that might be much better engaged.

Italian Medical Literature.

Though we receive numerous translations from French and German papers, we are not often favoured with selections from Italian current medical literature. We presume the number of Italian scholars is limited. Italian medical literature is well worthy of study, and we afforded our readers an instance of it in our issue of July 3rd, in the translation by Dr. A. H. Jacob, from the *Gazetta del Cliniche*, of a paper by Dr. Louis Girola, "On Pressure Within the Eye, and the Phenomena connected With It." As medical science is enriched by the contributions of all civilised nations, by comparing the results of treatment and observations in different countries, we regret that the writings of Italian physicians are not more known in England, and that we have fewer opportunities of communicating them to our readers. Their medical productions are well worthy of attention, equally with those of France and Germany, and we might impress on some of the junior members of the profession the wisdom of extending their literary studies into this field, with the assurance that they will find a rich mine of medical wealth. The Italians are free from the mysticism of the Germans and the credulity of the French, and as the language is imaginative and rich, the mind will be improved by catching something of that spirit which is wanting in our national temperament. We shall be glad to receive translations or Italian works for notice, and thus to familiarise English practitioners with the writings of Italian practitioners.

The Progressive Increase of Insanity in Ireland.

The Inspectors of Irish Asylums reviewing, in their lately issued Report, the progress of insanity in Ireland, say with reference to admissions during the past year (2,314), 1,924 of them were cases of a first attack, and 390 relapses. In the preceding twelvemonth a very proximate total, or 2,344 was registered within the same period. The number received into private licensed houses bore a close proportion, being respectively 174 and 186.

So far then as the more authentic statistics of insanity in this country sustain an opinion, and which on other grounds we apprehend to be correct, lunacy is not so progressive in it as it is regarded to be in other portions of the United Kingdom.

It may be proximately assumed that one individual in about 2,150 of the population is primarily attacked each year by mental disease, and as the recoveries or improveprovements justifying a discharge, and which occur at indefinite periods ranging from months even to years, may may be estimated at nearly 76 per cent. ; 24 would thus continue to be uncured ; hence asylums—making all due allowance for those who may die in them, or may be taken home by their friends—must necessarily become over-crowded in the progress of a generation.

Dr. Drysdale on Vaccination.

We are glad to see that Dr. Charles R. Drysdale has written a very sensible letter on this subject to the *Echo*, of last Saturday, which may help to remove some of the absurd prejudices and ignorance under which many of the readers of that paper doubtless labour. With regard to the efficacy and protective power of vaccination, Dr. Drysdale alludes to the well-known experiment of Jenner, in which he inoculated a vaccinated cow with small-pox matter without any result following ; while—as was well known at that time—had it been unvaccinated, the inoculation would have been inevitably followed by small-pox. He trusts, therefore, that the readers of the *Echo* will admit that this experiment sets the matter at rest as far as evidence can go, nor does the writer exaggerate the drawbacks which the anti-vaccinators allege against the operation ? In a few cases a serious contagious disease may have been spread by vaccination, but this has been rare in England, so rare, that although conscious of the fact, it has never prevented him vaccinating with human lymph either his patients or his own family. At the same time he thinks

it would be as well if the State provided a supply of calf vaccine, so that parents might have the option of having their children vaccinated with either kind of lymph.

"Durham University and its Future Role."

A NORTHERN university is said to be required. The time may come when it may be necessary to found another university, but at present all existing wants might be supplied by utilising the material at our command. There is a university at Durham possessing university chairs, scholarships, and all the requisites for education. It is virtually defunct and effete ; its degrees are, if not *valueless*, the next thing to it. Its professors enjoy *otium cum dignitate*. We would disturb their rest and galvanize the university into life and action. The situation is favourable to university life, the town is quiet and free from the objections that have been raised against such a large centre as Manchester. It has all the historic associations, not perhaps essential, but still a feature in university life not to be disregarded. It only requires remodelling, new chairs instituting, fresh life poured into it by professors of eminence and energy not only in literature but in science. The school of medicine does possess some vitality. A new system of examination might be easily arranged, one to meet the requirements of the northern towns. The University of London is a model to copy from. The sanction of Parliament may be required to alter the foundation ; little difficulty has been experienced in dealing with other foundations which have not harmonised with the spirit of the age. Durham should share the same fate.

The Effect of Fright.

THE following extract affords a notable instance of the power of the imagination in disease. At the same time, owing to the unwise method adopted by the lay press in reporting cases of hydrophobia, we may expect somewhat similar cases in England. At Autun, in France, the sub-station master of the Creuzot station was picked up in convulsions and foaming at the mouth. He exclaimed, "Bind me tight ; a mad dog has bitten me, and I am mad myself." He was tied as desired and taken to the hospital, where several surgeons, military and civil, watched the case. They found a scar on one hand from a dog-bite. The scar was three months old. They came to the conclusion that he had not hydrophobia, but that his mind was wrought upon by accounts recently published. The man is now reported convalescent.

Dark and Dark-Green Urine from external use of Carbolic Acid.

M. M. E KIRMISSON, in *La France Médicale*, describes a number of well-marked cases of dark and dark-green coloured urine, from the external use of carbolic acid. There seems to be no special danger in connection with this appearance. M. K. concludes, however, that as soon as the phenomenon is observed the use of carbolic acid should be modified. The differential diagnosis between the dark urine from the use of carbolic acid, and the dark urine from certain hepatic troubles, is to be found in the general condition of the patient.

American Doctors.

THE State Board of Health of Illinois proposed lately to give certificates to all doctors who had been in practice ten years in view of official appointments. The following (says the *Chicago Medical Times*) is a sample of many letters received from the "learned" profession :—

" . . . Ill. (*No date.*)

" Dr. J. H. RauCh dir Sir

I Sent that affidavit to you and haent herd from it I Sent one dollar in the Sam hov you got and Was it Write if it is not Write and let me no and I Will make it Write I practice on the electric Mode

" ___ ___ "

Upon being informed that applicants for certificates of ten years' practice were required to furnish evidence of good moral standing, &c., he sent the following :—

" . . . Ill., Feb. 1, 1878.

" Mr. John H. Rauch, M.D.,

with regard to Dr. —— as fasetion he as given entiar satifaction and is aman well Respected and has a good Morral Caractor and has Conducted him self in Every Respect as a Jentlem an since he has been in theas parts Dr. —— has Practiest Medis on in theas Parts for annumber of years your very Respectfully

" —— —— a Justice of they Peace."

The raw material from which this learned profession is manufactured seems to be somewhat responsible for such results as we have given, if we may judge from some remarks of a medical professor which occur in the same number of the journal from which we have already quoted. He is urging the importance of a preliminary examination in English, Latin, &c., and he illustrates the necessity of such by a few samples selected at random from the graduates' papers. "One tells of *justation*, another of the *cexsix*, and another of *synethaics*, and another talks of the *mencise*, and another rubbing his empty skull calls it *sefulic*, and to crown the whole another says this is *siens*."

A Remarkable Pronouncement.

THE *Chicago Medical Journal* calls attention to the following dogma asserted by Dr. Lander Lindsay in the *Medical Times and Gazette* of March 16 :—

"The rise and progress of what is called the science of therapeutics is merely, I believe, a *modern development of professional credulity*."

Perhaps, at the risk of displaying our ignorance, we may ask what the author means by such a statement.

THE Adulteration of Foods and Drugs Act having been in force sufficiently long to test its usefulness, the best results are beginning to show themselves in various parts of the kingdom. As an instance, we may mention that Dr. Muter, the analyst for Lambeth, has just presented his report for that important parish, according to which sixty-nine articles of common consumption had been analysed during the quarter, but *none of them* were adulterated. The samples submitted for analysis included bread, butter, sugar, tea, coffee, pepper, mustard, &c.

WITH the exception of about a couple of hundred pounds, the £1,750 required for the erection of the Harvey Memorial has been subscribed. The sculptor will be decided upon to-day, at a meeting of the sub-committee of the Fund, at the College of Surgeons.

The Small-Pox in Dublin

Was rather on the increase the week before last, the deaths registered being greater, but the admissions to hospitals somewhat less than the previous week. The Public Health Committee of the Corporation, in view of the continued prevalence of small-pox, has adopted the following resolution, viz., "That the Local Government Board be requested to consider the advisability of putting into execution the power vested in it for the prevention of the spread of epidemic diseases, the present outbreak of small-pox in Dublin having now lasted over six months, and there being little sign of its diminution, despite every exertion of the committee.

The death-rate for the week ending July 6th, was 24·8 per 1,000 of the population, London 22·1, Glasgow, 22·0, and Edinburgh 19·2. Within that week the zymotic deaths had decreased by 14, but was still 16 over the average. The death-rate of Dublin for the quarter ending June 29 was 30·3 per 1,000, that of London being only 22·4, of Glasgow 25·5, and of Edinburgh 23·6. The dirt diseases have cost the city within the three months 586 lives, or 201 more than the average of the same quarter of ten previous years. There were from small-pox alone within the quarter 212 deaths, only 5 of which occurred in the suburbs. Classifying these deaths according to the dates in which they occurred, it is found that 2 should have been registered in the previous quarter, 67 in April, 80 in May, and 63 in June. Allowing for deaths in June not yet registered, it would seem that the epidemic is not increasing in intensity, but that there has been but little abatement in the disease in the later weeks of the quarter. On the 27th of April there were 231 small-pox patients in hospital, in the two months succeeding 777 new cases were admitted, of whom 122 died, and 645 were discharged, leaving 241 under treatment. The rate of mortality was therefore 15·7 per cent. of all the cases. According to the latest returns 97 new cases had been admitted to hospital in the week ending July 6th, against 80 in the previous week, so that the epidemic appears to be rather on the increase than otherwise.

Rejections at the College of Surgeons.

In the last Annual Report of the Royal College of Surgeons of England there is the following record of the results of the College examinations during the year. Of 746 candidates examined for primary membership, 477 were "approved," and 269 "referred." Of 533 candidates examined for pass membership, 411 were approved, and 122 referred. Of 95 candidates examined for primary fellowship, 46 were approved, and 49 referred; and of 44 candidates examined for final fellowship, 33 were approved, and 11 referred.

Thus it will be seen that a large percentage of candidates at either of the above examinations failed to satisfy their examiners. This must arise either from the standard of examination being pitched too high, or to the candidates' ignorance of the subjects on which they are examined; and then again, this ignorance must be either owing to their own folly and idleness, or to the inefficient manner in which medical education is conducted at the schools, and the imperfect control exercised over the conduct of most medical students. The standard of examination cannot be said to be too high at any of the English, and much less the Scotch Corporations; and we know that the Medical Council is even contemplating making some of them higher than they are at present. The fault lies partly in the student himself and partly in his teachers, as we shall take an early opportunity of showing.

A remarkable pedestrian feat has been undertaken by an American diver, who proposes to walk under water along the bottom of the Ohio river, from Cincinnatti to Cairo, a distance of about 500 miles, in twenty-five days, for a wager of £2,000. He stipulates that a boat is to accompany him with an air-pump in order to supply him with air, and moreover that he is to be allowed to come up to the surface as often as he pleases, but that the boat is to be stopped whenever he does so in order that he shall walk every step of the way. For the sake of humanity it would be charitable to hope that a mermaid or other equally affectionate piscatorial creature may take care of this Cincinnatti diver, and put him to better use.

The last weekly rates of mortality in the principal foreign cities, were—in Calcutta 35, Bombay 43, Madras 41; Paris 23; Geneva 22; Brussels 20; Amsterdam 26, Rotterdam 28, The Hague 24; Stockholm 24; St. Petersburg 46; Berlin 39, Hamburg 28, Breslau 40, Munich 34; Vienna 28, Buda-Pesth 46; Rome 25, Turin 33, Venice 28; Alexandria 45, New York 21, and Baltimore 21. Small-pox caused 70 deaths in Calcutta, and 86 deaths were referred to typhus and enteric fever in St. Petersburg.

There were less than half the number of deaths from small-pox in London last week compared with the previous week—21 only being registered. There were 18 fatal cases in Dublin in the same period, but not one in any of the other large towns of the United Kingdom. Scarlet fever is exceptionally prevalent in Sheffield; infantile diarrhœa in Leicester, and whooping-cough in London. Most of the other diseases of the zymotic class are below the average.

Three attendants at the Gloucester Lunatic Asylum were, last week, committed by the coroner for trial at the assizes for the manslaughter of a patient. It was shown that four ribs were broken on deceased's right side and five on his left side, and his breast bone fractured. A patient, named Cook, deposed to seeing him jumped upon, and praying God to take him out of his misery.

Correspondence.

A CASE IN MIDWIFERY PRACTICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Some months ago I was sent for to attend a woman in her first confinement, residing in the County Sligo. On my arrival I ascertained that three days before she fell off a wall whilst carrying a can of water, and a few hours afterwards was complaining of "pains," and noticed a "slight flooding;" her face was pale and clammy, tongue dry and furred, feeble quick pulse, extremities cold.

On making a vaginal examination I discovered a placenta-like mass about the size of a large hen-egg protruding through the os uteri into the vagina. While I was so employed a strong uterine contraction came on, accompanied by a gush of blood, making the presenting mass very dense and hard, and almost protruding a portion of it externally.

When the "pain" had ceased I found the os so blocked up with the mass that I was unable to discover the fœtal presentation.

The patient's strength now demanded my attention, and after some time the pulse became better in quality, the extremities warm, and her general aspect improved.

The pains returned about every half hour, varying considerably in their strength, with slight hæmorrhage. During an interval I discovered the attachment of the cord, and that a larger portion of the placenta had been forced into the vagina, the fœtal head could now be made out pressing firmly on it anteriorly. When the os had become fully dilated, I emptied the bladder with a catheter, and seizing the placenta firmly with my right hand, at the same time using my fingers to tear through the adhesions posteriorly, I endeavoured for several hours off and on to remove it, without success, so firm were the adhesions, and the fœtal head pressing so powerfully on it anteriorly, rendering instrumental interference impossible for want of space.

As the patient's strength was rapidly beginning to give way, I deemed it advisable to consult with Dr. Shaw, of Riverstown, who kindly came and assisted me. In about four hours we removed the placenta with the greatest difficulty, each uterine contraction impeding our efforts to tear through the powerful adhesions.

On its removal it presented the following appearances :— A large oval mass about the size of a man's hand, slightly flexed, covered with a shining membrane ; its posterior surface (by which it was attached to the uterus) was convex, the anterior was slightly concave, with the funis attached to it nearly at its centre, the shining membrane being reflected along the cord, which was cut and ligatured ; it was about ten inches long, presenting the usual appearances of a funis ; a slight oozing of blood below the ligature on the fœtal (?) side, and from the side next the placenta was remarked. The cord was here and there slightly discoloured as if from pressure, slight traction was made on the portion apparently attached to the fœtus, but it resisted without either breaking or coming away.

I now put on the short forceps (Sir J. Simpson's), and delivered the woman of a living female child, the remaining portion of the cord coming away with the birth (but in no way attached to the child), to which was attached naturally a funis and placenta, the latter being removed about fifteen minutes after delivery. The uterus contracted rapidly and well.

The woman made a steady though slow recovery ; she and the child are now in sound health.

There was nothing that I could ascertain concerning the previous history of the woman that could in any way bear on the case. An experienced nurse who was in attendance informed me that from the time she took charge of the patient (about an hour after the pains began) "the only change that took place was more of the after-birth presenting and an increase in the pains."

From the great difficulty I experienced in the removal of the first placenta, and from the toughness of the adhesions, I imagined up to the time that I felt the attachment of the cord that it was a fibrous polypus I had to deal with.

The opinion I now hold about the case is that the woman must have aborted and retained the placenta, which was being metamorphosed into some form of polypus, and that she again became pregnant. Dr. Stadfeldt, of Copenhagen, recognises the possibility of such a case where a large portion of retained placenta may give origin to such a growth.

I regret very much that the usual custom of burning afterbirths (as practised in this district) was carried out in this case through the carelessness of the nurse, to whom I had given instructions to preserve both for me.

Yours, &c.,

JOHN MOLONY, L.C.R.S.I., L.K.Q.C.P.I.

Dromahair, Leitrim.

MEDICAL HALLS (?)

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Allow me to draw attention to the tendency of *Irish Pharmaceutical Chemists* to style their establishments "MEDICAL HALLS." My own impression is that such title is equivalent for "*Medical advice is to be had within,*" and is as unwise as it is misleading. Hitherto medical halls have been the establishments of medical men, who dispensed their own prescriptions, and kept what are called in England an "open surgery," trespassing, no doubt, on the chemist's business by the retail of drugs, &c. I think that such apeing on the part of pharmacists is not good for them, and that they would do better to "call a spade a spade," and settle at once to promote their legitimate avocation, and I hope that such medical halls may be discouraged by the entire medical profession.

Your obedient servant,

M. P. S. I.

QUEEN'S COLLEGE, GALWAY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As your issue of July 10th contained the letter of a gentleman who signs himself a "Student of Queen's College, Galway," disparaging the system of education carried on in that medical school, would you kindly permit me a short space in your valuable paper to correct what I imagine to be a few misrepresentations ?

During last session I must confess that there were only thirteen subjects for dissections (owing to the resolution passed by the Galway Board of Guardians towards the close of the session), but as all the subjects dissected there were preserved, and the students being most agreeable amongst themselves, the blame rests on the student himself, who had not mastered a fair amount of anatomy by the end of the session.

Your correspondent asserts that the "anatomical and physiological museum was more jealously closed than before." Being a medical student of Queen's College, Galway myself, I can testify that your correspondent has made a gross misrepresentation in making such an assertion. Being of over three years' standing in Queen's College, Galway, I never knew the museum "jealously closed" against any student, and during last session every facility was afforded the students, for the *museum* was open to every one who wished to avail himself of it, and the specimens were most willingly placed at the disposal of any student who took the trouble of applying to our Professor or Demonstrator.

May I ask, Sir, your correspondent how many students from Galway were in for degree examination in June? The question being answered, perhaps, your readers would not be astonished "that not a single student direct from Galway obtained the degree." Also, I think your correspondent's letter too premature. Had he waited until after the honour examination in September, I have no doubt a quite different result might have presented itself to him, as almost all the Galway men going up for their degree did not present themselves in June, but are lying out until the honour examination in September.

Thanking you for the space you have given me,

I am, Sir, your obedient servant,

A MEDICAL STUDENT, Q.C.G.

THE IRISH APOTHECARIES COMPANY AS A LICENSING BODY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I consider that the profession are greatly indebted to you for your timely exposure of the absurd claims put forward by the Apothecaries' Hall of Ireland for representation at the Conjoint Board.

That the Apothecaries of Ireland are a useful body of practitioners is undeniable. But the Irish apothecary has no voice on the Hall Board ; the present holders of the shares of the Company are principally widows, and of the twenty-one apothecaries who possess shares, fifteen are directors, and although the charter of the Company expressly notifies the

desirability of an occasional change of the persons forming the Board of Directors, by requiring an annual election, yet the fifteen gentlemen on the Board by voting for each other, systematically re-elect each other, and so manage, keeping the letter of the law, to break its spirit.

Can such men be said to represent the apothecaries of Ireland? No claim could be more false; if the apothecaries of Ireland had a vote in their election very different men would preside over the affairs of the Company. And yet, as a representative body, they claim admission to the Conjoint Examining Board. Having bartered away pharmacy, they now attempt to compete with the Colleges of Surgeons and Physicians, and in their most recent curriculum require of the candidate for the L.A.H. the performance of *one or more* operations on the dead body, and these men decide on the fitness of a candidate as an operator who have never attempted any surgery beyond drawing a tooth or dressing a cut finger, and, who would shrink from the least attempt at any important operation.

Might I suggest that prior to con idering the claims of these fifteen general practitioners to nominate one or more of their members to a seat at the Conjoint Board (and to pay him or them out of their trade profits, which profits should go into the pockets of their widow-proprietors) that the apothecary profession throughout Ireland should be called upon to express their opinion, and once and for ever convince the Hall directors that they cannot continue to misrepresent the Irish apothecaries.

Yours obediently,

L.A.H.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I shall be obliged by a reply to the following queries:—

What course would you advise a physician to pursue in a case where a medicine different from his prescription was sent by an apothecary, to the detriment of the patient? The apothecary *practices* as a rival. The physician has been frequently advised that he and his patients did not get fair play in the other's establishment. The prescription (which was recovered) was plainly and unmistakably legible.

The patient was put to much pain, and symptoms which it was the prescriber's intention to assuage were aggravated.

Relief was obtained by timely resort to the medicine prescribed. Whether intentional or accidental, it is obvious that this is a very serious matter.

I am, dear Sir,

AN ORIGINAL SUBSCRIBER.

12th June, 1878.

P.S.—Would you also say what is the law as to "Pharmaceutical Chemists" (as they are styled) deviating from physicians' prescriptions, and also as to their prescribing and visiting?

[No dispenser has the remotest right to deviate in any respect from the prescription, and it is a breach of trust to both physician and patient to do so. We are, however, not aware of any legal remedy. The patient might make a dispenser responsible if he could prove the substitution of any ingredient, and could show that damage was sustained thereby, but it would be difficult to find such evidence. We doubt that the physician has any remedy, though he is undoubtedly damnified in repute if his prescriptions are altered so as to be ineffective.—ED. M. P. & C.]

Medico-Parliamentary.

HOUSE OF LORDS.—JULY 12TH.

VIVISECTION.

Lord TRURO rose to present a number of petitions, so large that his lordship could scarcely enclose them in his arms. He said they were not signed by a few explorers in the boundless field of science or nature, or by medical men of eminence, but by hundreds, or rather thousands, of Englishmen and women, against the practice of vivisection. On a former occasion he had made some remarks upon the composition of the Royal Commission on this subject; but as his noble friend, the chairman of that Commission (Viscount Cardwell) was not in the House, he would therefore take the liberty of repeating those remarks in his presence. On that Commission there were two or three gentlemen who were well-known strong partisans of vivisection, an extremely eminent lawyer, who was also a keen sportsman, and the noble viscount and others who had passed so much of their lives in official duties, that they regarded everything from a logical and experienced point of view, and therefore likely to be prejudiced in their judgment on such a matter. The noble lord denied that any important discovery had resulted from vivisection, and was proceeding with much warmth and at considerable length to attack the report of the Commission, when

The Earl of KIMBERLEY rose to order. The proper way of raising the question would be by giving proper notice.

Viscount CARDWELL said that either with or without notice the proper opportunity would have been when their lordships had before them a Bill founded on the report of the Commission. That Bill was fully discussed in the Upper House, as well as afterwards in the House of Commons, and was now the law of the land. His (Lord Cardwell's) colleagues on that Commission would be greatly surprised when they heard of his noble friend saying they were prejudiced against the cause of humanity, or that any of them were partisans of vivisection (hear). Having served on that Commission, he could testify that no men could have shown more impartiality or a greater desire to promote the cause of humanity (cheers).

The subject then dropped.

Literature.

LECTURES ON DISEASES OF THE NERVOUS SYSTEM. (a)

THIS work by Dr. Wilks, will not be merely acceptable to his old and present students at Guy's, but to the profession at large. His reputation, especially for researches into the nervous system, is not confined to English-speaking countries, but extends wherever medical science exists. It is announced in the preface that much of this work has previously appeared in print, especially in the Guy's Hospital Reports, but that the older lectures are supplemented by the additional matter which has accumulated since they appeared. This bringing the older lectures abreast our present knowledge has been done thoroughly and effectually. Publishing this work in the form of lectures, "does not admit of a reference to the source of information from which the instructor draws. He offers what he has in his own possession, but how much of his wealth has been acquired by his own digging, how much delivered over to him by his predecessors, and how much he has been unconsciously acquiring from his contemporaries, is unknown even to himself." This we think is a very straightforward way of treating the matter; and we prefer a work of this kind, which bears the evidence of thought on it, to those works which are flooded with references, lists of works consulted by the author, and other evidences of research, either genuine or a clever simulation of research, but which do not carry with them the stamp of the digestion of the data so culled. Such a plan may be necessary to demonstrate the erudition of a young aspiring author; but Dr. Wilks can well afford to do without such a parade, and he very wisely discards it.

It is very difficult amidst such an *embarrass de richesses* to know what to select for quotation to illustrate the matter and the style. But a few passages can be given. For instance, "it is said that the pattern of body which is most prone to apoplexy, is denoted by a large head and red face, shortness and thickness of neck, and a short, stout, squat build. This remark is as old as the time of Hippocrates. Such persons as just described died suddenly. True, and according to my showing, the very proof that they were not apoplectic. The fact is the blood is poured out in the brain because a vessel has burst. The person in whom the vessels are diseased, is

(a) "Lectures on Diseases of the Nervous System." Delivered at Guy's Hospital by S. Wilks, M.D., F.R.S. J. & A. Churchill. 1878. Pp. 470.

consequently he in whom apoplexy is most likely to occur. Such a person is often pale and thin, with a long neck. I knew a gentleman some years ago, who had such an extraordinarily red face that some young friends disliked to walk in the streets with him, lest he should die of apoplexy; his face was of a deep purple hue, like a ripe gooseberry, ready it was thought to burst and let out its contents. This gentleman died of heart disease." The question of bleeding in apoplexy is a very instructive piece of writing, and will be read with pleasure. Of railway concussion he writes, "when one considers the velocity of a heavy train, it is clear that the momentum with which it strikes any obstacle in its way must be immense. If one remembers, also, that some of the component parts of this mass of material are fragile human beings, composed of flesh and blood, with delicate soft brains and spinal cords, no surprise can be felt in witnessing the terrible results of a train proceeding at the rate of forty miles an hour, when brought to a sudden stop. It has often been credibly stated that after an accident persons have been taken up insensible, but without the slightest mark or bruise upon them; and indeed, I see nothing marvellous in the proposition that the soft cerebral mass striking against the hard skull-case should be thrown into confusion, and insensibility result. Well! our poor brains and spinal cords cannot be thus roughly treated without the necessary consequences, and a variety of symptoms from the day of the accident are set up, which develop into manifold troubles, or even end in a permanent palsy both of body and mind."

In writing of "sympathetic mania," Dr. Wilks says: "It is very probable that minor forms of melancholia and hypochondriasis may often have a real seat in the abdomen; as for example, in the case of an old lady who was so great a trouble to the doctors that they regarded her as a confirmed hypochondriac; she always had a most dismal countenance, and a long string of troubles to relate to them, but no disease of any kind was discoverable after repeated examinations. Having died of chest disease, I took the opportunity of procuring a *post-mortem* examination, in order to discover, if possible, why she always had such disagreeable feelings in her abdomen. I found a portion of omentum adherent to a femoral sac, and this dragged down the colon to the pelvis. I conjecture that this might, through the sympathetic system, have been the cause of her abdominal anguish and continued low spirits." These quotations will serve to show the style in which the matter is presented to the reader.

The reader will find in this work all he can hope for as to bulbar paralysis, insular sclerosis, acute ascending paralysis, and other maladies with which we have only recently become acquainted. Part first is devoted to the brain and its diseases. Part second, to the cord and its diseases. Part third, to functional and general diseases; while part fourth is engaged with the nerves and their maladies, concluding with general remarks on remedies and electricity. Dr. Wilks thinks that electricity has to play a very prominent part in the treatment of affections of the nervous system. It may be questioned whether Dr. Wilks is a very ardent therapeutist in other directions.

Here and there in the work are little matters which might have been more elaborated. Thus Part first ends with delirium tremens, the concluding sentence being as follows: "In many cases of delirious excitement, you will find that as soon as a hot vapour surrounds the patient he sinks into a quiet sleep." Surely it might have been well to have given the temperature of a delirious patient before and after the bath, and thus have shown the good effects of a lowered temperature upon febrile excitement. On the whole we are much pleased with this work, and are much mistaken if it does not prove a favourite handbook with the profession.

GOULSTONIAN LECTURES ON THE NATURAL HISTORY OF PULMONARY CONSUMTION. (*a*)

THE memorable discussion on tubercle at the Pathological Society in 1873, if it served no other useful purpose, at least called prominent attention to the "utter vagueness and confusion in which the subject is encouraged to lie." The conflict of leading opinion, no less than the bewildering jungle of scientific nomenclature through which the search for truth was led on that occasion, must have induced many a perplexed student devoutly to pray for some clear and authoritative exposition of the facts as they really stand, and Dr. Shepherd's lectures came, therefore, at a very opportune time, and enabled him with all the authority of the Goulstonian chair, to reduce the tangled threads of knowledge to something like true order, and to furnish the profession with a most complete and graphic account of the various pathological and clinical touches which go to make up the great picture of pulmonary consumption. What is tubercle? Is it an absolute entity a specific structure, or an accidental product? What relation does it bear to phthisis, and what *rôle* does inflammation play in the life-history of this class of diseases? are questions which have been keenly debated of late years, and to which it may perhaps be difficult to give a definite answer even now. Dr. Shepherd, however, brings to his task, not only a complete acquaintance with the literature of the subject, but large opportunities for observation at the Victoria Park Hospital and elsewhere, and the general conclusions at which he has arrived may be summed up briefly as follows:—

If the term tubercle is to be retained at all—and Dr. Shepherd is almost inclined to go with Dr. Bastian in his desire to see it expunged from our language—let us distinctly understand it to mean "hard nodules," mainly due to growth of the peri-vascular and peri-bronchial cords, together with alveolar catarrh of smaller or larger extent. These growths are secondary to some cheesy focus, not necessarily present in the lungs. They have no developmental connection with the intra-alveolar and intra-bronchial changes found in the ordinary pulmonary phthisis, and victims of this acute tuberculosis perish rapidly with symptoms which in no degree point to any implication of the lung.

Phthisis, proper, on the other hand, may originate either in catarrhal inflammation of the epithelium lining the alveoli and smaller bronchi, or in changes in the walls of the vesicles and bronchi themselves, this forming the intra-alveolar division, which includes the commoner varieties of the disease.

Passing on to the extra alveolar class in which we meet with "fibroid proliferation of the septa of the alveoli," Dr. Shepherd has much interesting information to give us regarding the so-called "fibroid phthisis" in which the irritation of alcohol or syphilis gives rise to the symptoms and appearances so well described in the text.

The third lecture furnishes some interesting information on heredity, the prognostic value of hæmoptysis, and the influence of sex, age, and climate on the origin and progress of the disease; and some judicious remarks on the too frequent abuse of cod-liver oil, bring the book to a conclusion. We congratulate Dr. Shepherd on having produced a work of the true scientific stamp, temperate and judicial, vigorously written, and with that smack of learning so thoroughly in keeping with the august body before whom the lectures were originally delivered. While the book itself is an excellent one, the author has been most ably seconded by the artist, and Mr. Noble Smith has produced a series of illustrations, which must undoubtedly take the first place in pathological art. Good as the microscopical drawings are, the three coloured plates are beyond all praise, and whether as regards rigid scientific accuracy, or absolute artistic perception and finish, we look upon them as distinctly superior to anything else of the kind which we have had the opportunity of inspecting.

(*a*) "Goulstonian Lectures on the Natural History of Pulmonary Consumption." By A. B. Shepherd, M.A., M.D., F.R.C.P. Smith, Elder, and Co.

A Laryngological Association.—All the principal medical men engaged in this special department in the United States, have formed themselves into a permanent organisation, with a constitution and bye-laws, and the following officers:—President, Dr. Louis Elsberg, of New York; Vice-President, Dr. F. H. Davis, of Chicago; Secretary and Treasurer, Dr. George M. Lefferts, of New York; Council, Drs. Clinton Wagner, of New York, William C. Glasgow, St. Louis, E. L. Shurley, Detroit, J. H. Hartman Baltimore. The first annual meeting will be held in New York on the second Tuesday in June, 1879.

Jervis Street Hospital, Dublin.—A new and spacious hospital on a site immediately adjoining the old hospital is at present in course of erection, the foundations being already laid. The new structure will have an area of 1,500 square yards, and will be capable of accommodating 300 patients. The building fund having been entirely expended in purchase of the new site and the removal of the old houses by which it was occupied, a sum of £30,000 will be required to complete the new institution.

Medical News.

Royal College of Surgeons of England.

Office Bearers for 1878-79.

At a meeting of the Council on Thursday last, Mr. John Simon, C.B., F.R.S., was elected President, and Mr. Luther Holden, F.R.C.S., and Mr. John Eric Erichsen, F.R.S., were elected Vice-Presidents of the College.

At a special meeting of the Council, on the preceding day, Mr. John Marshall, F.R.S., and Mr. Timothy Holmes were re-elected members of the Court of Examiners. Mr. W. H. Flower, F.R.S., and Mr. W. K. Parker, F.R.S., were re-elected Professors of Comparative Anatomy and Physiology, and Mr. Jonathan Hutchinson, F.R.C.S., was elected Professor of Surgery and Pathology. The Professorship of Dermatology, founded by Professor Erasmus Wilson, F.R.S., is at present in abeyance, pending some proposed alteration. At this special meeting of the Council the recently elected members were admitted as members of Council in due form, and took their seats—viz., Mr. Erasmus Wilson, F.R.S., re-elected on retirement by rotation this year; Mr. John Gay, F.R.C.S., re-elected after an absence of one year from the Council; and Mr. Edward Lund, F.R.C.S., of Manchester, who has not before served.

Primary and Pass Examinations.

The following is the report from the Board of Examiners of this College, of the number of candidates who have presented themselves for the *primary* and *pass* examinations for the diploma of member of the College during the collegiate year 1877-78, showing the numbers passed and rejected from each medical school during that period :—

Primary Examinations.

Medical School.	Total.	Number passed.	Number rejected.
St. Bartholomew's	97·83	69	28·83
Guy's	90·50	63·50	27
University College	84·60	54·3	30·30
St. Thomas's	49	33·50	15·50

In the above list candidates who are indicated by a fraction have received their education at two or more schools of medicine

University of Dublin.—At a meeting of the Senate on July 4th, the following degrees were conferred :—

Bachelor in Surgery.—Edward James Cowen, Henry Lawrence Cox, Francis Augustus Bonner Daly, James Dunne Day, James Campbell Hall, Arthur W. P. Inman, William Cox Neville, Guy Percival L'Estrange Nugent, John Gregg O'Neill, William Cleland Wilkinson, Richard Blayney Wrightson.

Bachelor in Medicine.—Fredk. Charles Berry, Ludovic Buchanan, Cecil Josiah Bushe, James Campbell, Walter Peter Carson, Francis Augustus Daly, Yelverton Dawson, Henry Singer Gabbett, Joseph Gibson, James Campbell Hall, Richard Atkinson Hayes, Reynolds P. Hetherington, Arthur W. P. Inman, James Bostok Jacob, Robert Henry Johnston, Christopher John Nixon, Guy Percival L'Estrange Nugent, John Gregg O'Neill, Walter Pool, Fredrick Ogilby Ross, William Cleland Wilkinson.

Master in Surgery.—Robert Norman Thompson, William Fetherstonhaugh Lambert.

Doctor in Medicine.—William Chatterton, William Clibborn, Arthur Henry Cole Daue, Yelverton Dawson, Herbert John Fausset, William Frazer, Henry Alex. Gogarthy, Richard Atkinson Hayes, William Walter.

Master in Obstetrick Arts.—William Cox Neville.

Licentiate in Medicine.—James Grove Crofts, Crosdaile Miller Thompson.

Licentiate in Surgery.—James Grove Crofts, Crosdaile Milfer Thompson.

Seamen's Hospital Society, Greenwich.—A general court of the governors of the Seamen's Hospital Society (late *Dreadnought*) was held on Friday last, when a statement of the work of the Society was presented; from which it appears that 368 seamen have been admitted to the hospital as in-patients during the past quarter from British and foreign ships, of which number 77 came from the port of London, 26 from Liverpool, 17 from Glasgow, 9 from Newcastle,

from Sunderland, and 5 from Dundee. In addition to the British seamen, 1113 sailors of different nationalities were benefited, including 28 from Sweden and Norway, 22 from Germany, 18 from the colonies, 13 from the United States, 10 from Russia, and representatives from Austria, Italy, Spain, France, Holland, Mexico, India, and Denmark. The accounts presented a deficiency of £458.

Resuscitation in Poisoning and Asphyxia.

In apparent death from chloroform, resuscitation can be effected by means of artificial respiration in those cases only, in which the heart has not yet fully stopped beating. If the latter accident has occurred, compression of the thorax becomes necessary, and even this loses its utility 7 to 19 minutes after the stoppage of the circulation, and 10 to 24 minutes after cessation of breathing. Sudden deprivation of oxygen (rapid asphyxia) paralyses the heart much more rapidly. Artificial respiration, combined with methodic compression of the thorax, must be commenced at the latest 1 to 1½ minutes after stoppage of the heart, in order to succeed as means of resuscitation. Resuscitated animals show a number of "symptoms of resuscitation from apparent death." Boehm describes them (*Archiv. fer Exp. Path.*) as increased reflex irritability, as in animals poisoned with strychnia, in co-ordinated movements, diminished sensibility, blindness remaining for two to three days, probably also loss of hearing, taste, and smell, reduction of temperature, and finally transitory glycosuria. In general, the animals resemble for a time dogs, whose cerebrum has been removed by the method of Goltz. Similarly, as in deep narcrosis, the different organs do not all return to a state of activity at once. The heart first begins to act, next respiration returns, and finally the functions of the brain are re-established.

NOTICES TO CORRESPONDENTS.

An Interested One.—Our contemporary was a little "behind the fair." You will find the correct information in our issue of the previous week.

A Volunteer Surgeon will find Surgeon-General Gordon's "Lessons in Hygiene and Military Surgery from the Franco-German War" of the greatest possible assistance. The lessons are based upon the experience of one of the ablest and most observant surgeons of the British service, who, as officially representing the British Government in one of the greatest wars of modern times, had every advantage for studying and reporting upon the various methods and appliances of field and internal siege surgery. We heartily commend the book.

Gastronomic.—The *Students' Journal* is responsible for the following:—"A young lady at home from boarding school for the holidays was asked if she would have some roast beef, when she replied, 'No, I thank you; gastronomical satiety admonishes me that I have arrived at the ultimate stage of deglutition consistent with dietetic integrity!' She was never asked if she'd have anything more again."

Mr. G. S. C. will please receive our best thanks for the information of which he will see we have made use in the present number.

Dr. John W.—Our publisher informs us that the number is out of print.

Indian Medical Service.—Notice will be found in our advertising columns of an examination of candidates for fifteen appointments in Her Majesty's Indian Medical Service on the 12th proximo. The necessary certificates must be submitted to the Military Secretary at the India Office at least a fortnight previously.

Communications, Enclosures, &c., have been received from—Dr. Byrd, Quincy, Illinois. Mr. John Gay, London. Dr. Harley, London. Mr. Erichsen, London. Dr. de Senna, Barcelona. Dr. Alford, Hampstead. Dr. Crossley, Rotherham. Dr. Williams, Fulham. Dr. Leet, London. Mr. James Shaw, Dublin. Dr. Stretch Dowse, Hornsey. Dr. Marmaduke Taylor, Cavalry Barracks, Windsor. Dr. Fixott, St. Heliers, Jersey. Mr. Jabez Hogg, London. The Registrar-General. Dr. Bell Taylor, Nottingham. Mr. Pearce, Pimlico. Dr. Hendrie, Cheshunt. Dr. Bernard Kelly, Rotherhithe. Dr. Morell Mackenzie, London. Dr. Barnardo, Stepney. Dr. Hunter, Bulman Village, Newcastle-on-Tyne. Dr. Lemoine, Rheims, France. Mr. D. Browne, Achill. Dr. De Fonmartin, Seamen's Hospital, Greenwich. Dr. Lyons, Dublin. Dr. Shuttleworth, Royal Albert Asylum, Lancaster. Dr. Peirson, Scarborough. Dr. Cox, Hawkesbury-Upton. Mr. Douglas Hemming, Notting Hill. Mr. Metcalfe, Paddington. Mr. Marlett Boddy, Camberwell. Mr. George Meadows, Hastings. Mr. Wheeler, Darlington. Mr. F. B. Courtenay, London. Mr. Squire, London. Dr. Byrom Bramwell, Newcastle-on-Tyne. Dr. O'Flanagan, Houghton-le-Spring, Durham. Mr. Teevan, London. Mr. Copland, Brighton. Dr. Stott, Haslingden, Lancs. Dr. J. Speer, Liverpool. Mr. G. C. Harding, Margate. Dr. Stokes, Dublin. Dr. Gillespie, St. Thomas's Hospital, Westminster. Dr. Krishaber, Paris. Professor Tichborne, Dublin. Dr. Scudda, Cincinnati, &c., &c.

VACANCIES.

Birmingham Borough Lunatic Asylum.—Assistant Medical Officer. Applications, with testimonials, to the Clerk, at the Asylum, on or before July 23, addressed to the Committee of Visitors.

Bradford Infirmary and Dispensary.—Dispensary Surgeon and House Physician. Salary, attached to each office, £100 per annum. Applications, with testimonials, to the Secretary on or before July 25.

Carmarthen Infirmary.—House Surgeon. Salary, £125. Must have a knowledge of Welsh. Applications to Mr. H. Howells, 58 King Street, Carmarthen. Election, July 31.

Manchester, General Hospital for Sick Children at Pendlebury.—Physician. Salary, £300. Occupant of the post may engage in consulting but not general practice. Applications before July 29. (See Advt.)

Newcastle-on-Tyne Borough Lunatic Asylum.—Assistant Medical Officer Salary, £100, with board and lodging. Applications to the Medical Superintendent before July 23.

Newport Union, Achill Dispensary District.—Medical Officer. Salary, £100, exclusive of fees. Applications to Mr. Carr, Achill, Newport. (See Advt.)

Portsmouth Royal Hospital.—Medical Officer for the Lock Ward. Annual salary at the rate of £150 first six months, £200 afterwards, with board and lodging. Applications, with testimonials, to the Chairman, The Vicarage, Portsmouth.

Royal Albert Infirmary.—Junior House Surgeon. Salary, £60, with board. Applications before July 29 to the Hon. Sec. at the Infirmary, Wigan.

APPOINTMENTS.

Byrne, William, M.B., B.Ch. Univ. Dub., Senior House Surgeon to the Metropolitan Free Hospital, London.

Croly, Thomas H., L.R.C.S. Edin., &c., Medical Officer to the Achill Dispensary, Newport Union.

Dixey, H.E., M.B., C.M., Junior House-Surgeon to the Royal Infirmary, Preston.

Dodd, T. A., L.R.C.P. Ed. & L.M., M.R.C.S.E., an Assistant Surgeon to the Newcastle-upon-Tyne Infirmary.

Field, A. F., M.D., L.R.C.P. Ed., Medical Officer of Health for the Swaffham Rural Sanitary District, Norfolk.

Gibson, G. A., M.B., C.M., D.Sc., Assistant Physician to the General Hospital, Birmingham.

Hodges, W., M.R.C.S.E., Medical Visitor of Fairford House Lunatic Asylum, Gloucestershire.

Hunt, J. W., M.D., an Honorary Physician to the Wolverhampton and Staffordshire General Hospital.

Langdon, J. W., M.R.C.S.E., Senior House Surgeon to the Royal Infirmary, Preston.

Le Tall, F. T., M.R.C.S.E., Medical Officer of Health for the Handsworth Urban Sanitary District, Yorkshire.

McDowell, Francis V., L.R.C.S.I., &c., Medical Officer to the Baltinglass Dispensary, Baltinglass Union.

McMaster, A., L.R.C.P.Ed., L.R.C.S.I., Medical Officer and Medical Officer of Health, &c., for the Ballygawley Dispensary District of the Clogher Union, co. Tyrone.

Smith, A. T, Medical Officer to the Annandale, Thornton, and Springhill Collieries, near Kilmarnock.

Army Medical Department.—Surgeon-Major F. L. G. Gunn retires on half-pay; Surgeon-Majors R. J. W. Orton and S. P. Woodfull retire on temporary half-pay; Surgeon-Major A. W. Shedden, M.D., resigns his commission; Surgeon-Major T. Y. Baker, from half-pay, to be Surgeon-Major.

Births.

Kearns.—On July 2, at Benagher, the wife of Robert Kearns, M.D., of a daughter.

Lovell.—On July 11, at 53 Wellington Road, St. John's Wood, the wife of J. O Lovell, M.R.C.S., L.R.C.P., of a daughter.

Owen.—On July 7, at Haulpe, Beaumaris, Anglesea, the wife of R. Briscoe Owen, M.D., M.R.C.S., of a son.

Marriages.

Hare—Alpe.—On July 11, at St. George's, Hanover Square, W., Surgeon-Major Hare, A.M.D., to Alice Blanche, daughter of J. P. Alpe, of Freshwater, Isle of Wight.

Salmon—O'Beirne.—On July 3, at Boherquill, co. Westmeath, Thomas Salmon, M.D., Castlepollard, to Jane, youngest daughter of the late James O'Beirne, Corelly House, co. Westmeath.

Deaths.

Bowen.—On June 17, at Richmond Road, Hammersmith, C. Chappell Bowen, Surgeon, aged 86.

Calder.—On June 30, at Victoria Road, Aldershot, William Menzies Calder, Surgeon-Major, Army, aged 48.

Fraser.—On July 7, at Hampstead, Donald Fraser, M.D., aged 67.

Harris.—On July 4, at Kempston, Bedford, Henry Harris, L.R.C.P., aged 45.

Kennion.—On July 8, at All Saint's Vicarage, Bradford, Catherine Elfrida, widow of George Kennion, M.D., F.R.C.P., late of Harrogate.

Murphy.—On June 19, at Bagenalstown, co. Carlow, Joseph W. C. N. Murphy, L.R.C.P.L., Assistant-Surgeon, Army, aged 40.

O'Neill.—On May 31, at Port Wellington, Madras, Charles J. O'Neill, Surgeon A.M.D.

Robertson.—On July 11, at Sele Grange, Hertford, Montgomery Robertson, M.D., aged 73.

Scobell.—On July 8, at Plympton, Devon, Thos. E. Scobell, M.R.C.S., aged 32.

IRISH POOR-LAW INTELLIGENCE.

DUBLIN SANITARY ASSOCIATION.

THE Annual General Meeting was held last Thursday evening. The Chair was taken by Lord James Butler.

Mr. R. O'B. Furlong read the annual report. The Committee regret to say that the epidemic of small-pox, to which they alluded in their last report, has but too fully verified the predictions of your Committee, and assumed very serious proportions in this city. On the first appearance of the disease in Dublin in the autumn of 1876, your Committee urged upon the Local Government Board, the Public Health Committee, and such of the Dublin hospitals as received fever patients, the necessity of adopting special measures to prevent the spread of small-pox ; they also issued a placard warning the public of the danger of the disease, and pointing out the best means for its prevention and treatment. The existing vaccination laws are loosely carried out—the local authorities abstaining from prosecuting defaulters, or only inflicting nominal fines, the excuse for such leniency being that the law is insufficient. Your Committee are aware that these deficiencies do not exist in the law in force in England. The defects are as follow :—A child may remain unvaccinated for a period of six months after its birth without its parents incurring any penalty. The period in England is but three months. Public vaccinators in Ireland have no power to take lymph as in England thus limiting considerably the lymph supply. There is no inspection of vaccination in Ireland, nor is there any system of awards for special zeal and efficiency in carrying out the practice as in England. The payments to public vaccinators in Ireland are so small that it is not worth their while to be zealous in the discharge of their duty. With regard to the fee allowed for each case of successful vaccination in Ireland (one shilling), your Committee consider it to be quite inadequate. Besides neglected vaccination there are unfortunately other causes for the prevalence of small-pox which do not require any new enactment for their removal :—1. The disgraceful sanitary state of the city as evinced by the high death-rate. 2. The want of proper sanitary organisation and supervision. 3. The want of proper means of removing infected persons to hospital. 4. The want of epidemic hospital accommodation. This is a great defect in hospital organisation in Dublin.

Mr. Charles H. Meldon, M.P., moved the adoption of the report, and the statement of accounts. He regretted very much that the report did not give a very favourable account of the sanitary state of the city of Dublin. In point of fact, he was afraid he must describe the sanitary condition of the city as almost as bad as bad could be. Certain it was that it far and away exceeded in its rate of mortality any other city in the United Kingdom. There were no means better adapted to bring about that state of public feeling on sanitary matters which ought to exist than the existence of an association such as that in the midst of the parties interested. One could not look to the names of gentlemen on the committee of the association, eminent scientific men, eminent professional men, and men eminent for the services they had conferred upon their fellow citizens, without feeling that that was an association that deserved public support and hearty co-operation by everyone. They had the sanitary matters in the city watched over by a Committee of the Corporation —the Public Health Committee—composed of gentlemen no doubt actuated by the best motives. There was no greater fallacy than the supposition that there must necessarily be some antagonism between that body and this association. Their only wish was to facilitate the Public Health Committee in their arduous duties, while creating a feeling among the public in favour of sanitary reforms. The subject with which the report opened was a very melancholy one, having reference to the very severe epidemic at present raging in the city. He would like to call attention to the fact that the first steps which had been taken in order to do away with the evils of that epidemic were taken upon the motion of that association. Alluding to the subject of vaccination, he thought they had just ground of complaint in the fact that the law in regard of vaccination was infinitely more stringent in England than in this country, and consequently in the former country the law was calculated to do more good than in Ireland.

Mr. Furlong, in seconding the resolution, regretted that the paragraph in the report as to the Public Health Committee having renewed the practice of destroying the clothing of small-pox patients was not correct. Though this was the safe and proper course to adopt, as recommended by most eminent sanitary authorities, the Public Health Committee were content with merely disinfecting the clothing by washing. He looked upon the establishment of artizans' dwellings in the city as the most striking of the results of the association, they having been the founders of the Artizans' Dwellings Company.

The resolution was passed.

Dr. Smyly, President R.C.S., proposed the election of officers and committee for the year 1878-79.

Dr. Grimshaw, in seconding the motion, said there was a point to which he would like to refer, and that was the great services Mr. Meldon had rendered, not alone to that association, but to the public generally, with regard to the Public Health Bill now before Parliament. (Hear, hear.) He thought he ought to say that singly Mr. Meldon had more to do with that Bill than any other member in the House of Commons. (Hear, hear.) With regard to the vaccination laws, bills had been drafted and prepared, but the Government had thought fit to pigeon-hole them for a year, when they might have been brought out before the present small-pox epidemic, and have conferred great advantages. They in the city of Dublin had very unfortunate experience with regard to hospital accommodation to meet such epidemics. (Hear, hear.) There was an idea abroad that each epidemic should take care of itself—that was a very unfortunate idea indeed. (Hear, hear.) In the last two outbreaks the extra accommodation had been

provided at a ruinous cost—certainly at a far greater cost than if it had been looked after in proper time. (Hear, hear.) There was only one epidemic hospital in Dublin—the Cork Street Fever Hospital—and it was of a very limited character, and totally incapable of coping with an outbreak such as they were at present visited with. The only other means available were the fever wards of the general hospitals, and it was rather a dangerous thing to introduce the epidemic there.

Dr. Smyly having been called to the second chair, a vote of thanks was passed to Lord James Butler, when the proceedings closed.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JULY 6, 1878.

Total registered deaths in Dublin and suburbs*			... 150
Ten years average of same week	...	...	... 122
Excess of mortality above average	...	...	... 38
10 weeks' ratio of deaths Rathmines			21·4 per 1,000

„ „ „ Kingstown			17·4 „
„ „ Entire Dublin District			24·8 „
Comparative Ratios—London		...	22·1 „
„ „ Glasgow		...	22·0 „
„ „ Edinburgh		...	19·2 „

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Thirty-nine deaths from zymotic diseases were registered during the week, being 14 less than in the preceding week, but 16 over the average for the 27th week of the last ten years. Thirty-six of these deaths were caused by six of the principal diseases of this class, viz., 18 by small-pox, 9 by fever (2 typhus, 5 typhoid, and 2 simple continued fever), 5 by whooping-cough, 2 by diarrhœa, and 1 each by scarlet fever and diphtheria. Two of the deaths from small-pox were chargeable to the North City Districts, 13 to the South City, and 3 were cases admitted into hospital from without the Dublin Registration area. Ninety-one new cases of small-pox were admitted into seven of the Dublin hospitals during the week, against 80 in the preceding week, 84 patients were discharged as cured, and 15 died, leaving 228 under treatment on Saturday last, being 8 less than the number on Saturday, 29th June.

Ten children died from convulsions.

Fourteen deaths resulted from bronchitis, 2 from pneumonia, 1 from pleurisy, and 1 from lung disease unspecified.

Five deaths were attributed to heart disease, 3 to paralysis, 2 each to apoplexy and epilepsy, 1 each to cephalitis, and brain disease unspecified; 2 to jaundice; 2 to Bright's disease, and 1 each to diabetes and cystitis.

Phthisis caused 25 deaths, hydrocephalus 3, mesenteric disease 2, and scrofula and cancer 1 each.

Belfast.—Three deaths from scarlatina, 1 each from small-pox, diphtheria, and measles, and 2 from diarrhœa were registered during the week.

Galway.—Two deaths from small-pox and 1 from fever were registered.

ABSTRACT OF THE TWENTY-SEVENTH REPORT ON LUNATIC ASYLUMS IN RELAND.

(Continued from our last.)

But while gratified at the generally favourable state of our public asylums, we cannot avoid expressing regret at the unsatisfactory condition of Londonderry district in respect to its insane poor, one not altogether creditable to such a wealthy and enlightened locality. On different occasions the advisability of erecting a new asylum was brought by us before the Executive, our effort for years to induce the Board of Governors to take action having proved fruitless. The asylum built nearly fifty years ago, for 112 patients contains at present 260; so over-crowded is it that as many as from eight to nine beds are to be found in dormitories scarcely calculated for five. There is nothing like adequate day-room provision, the kitchen and laundry for the use between sane and insane of 320 inmates, have, respectively, not more than eighteen feet square of superficial area; there is no infirmary, no refectory, no chapel, no suitable out-offices of any kind, no space for airing-yards; in a word, it has no recuperative power, and such being the case, ought to be replaced by one erected on a well-adapted and open site of from forty to fifty acres. We can discover no reasonable excuse why the Londonderry district with its 170,000 inhabitants and a rateable income of nearly £400,000 a year, should not provide an adequate accommodation for its insane poor.

There is a second northern district in which there is a dearth of lunatic accommodation, but by no means like to that in Londonderry. The county of Antrim, including the rapidly progressing borough of Belfast, contains a population of 410,000, with, fortunately for itself, an annual property under Poor-law valuation of nearly a million and a quarter. The asylum of the district is occupied by 440 patients, with an excess of admissions from one year to another so great that it is now overcrowded by 80 beds, space for which has been principally obtained by the conversion of workshops and other rooms from their primitive objects into dormitories.

The primitive statute directing the construction of public asylums for the insane poor of Ireland was passed in 1821,—the first and second George IV., cap. 33. By it the Lord-Lieutenant in Council was authorised to establish such institutions when and where it seemed expedient to him, while for the purpose of doing so the the more efficiently, eight Commissioners were nominated to superintend the execution of all operations connected with them.

The building of nine asylums, capable of accommodating between them 980 patients, was some years afterwards commenced at Armagh, Ballinasloe, Belfast, Carlow, Clonmel, Limerick, Londonderry, Maryboro', and Waterford, for their respective districts, some of them composed of as many as five counties. They were not, however, fully occupied before 1835, such was the dislike of the humbler classes to the name of mad-houses, by which they were commonly recognised. In 1836 the Board of Works assumed the duties of the Commissioners, who had retired, and continued to act up to 1861, when by the 18 and 19 Vic., cap. 109, two members of the Board, including the Chairman and the two Inspectors of Lunatics, were appointed Commissioners of General Control and Correspondence, and have now been in office seventeen years. The Act 1 and 2 G. IV. conferred on the Lord Lieutenant in Council unlimited power, not only to obtain from the consolidated funds moneys necessary for the establishment of public asylums, but to apportion the repayment of them in such modes and over such periods as he might think advisable, and by a subsequent statute he was authorised to direct that a sum not to exceed ten thousand pounds should be advanced quarterly to any one asylum for its support, an amount which has never been required, the largest so obtained being at the Richmond or Metropolitan for £8,000. Advances, whether made for buildings, furniture, the purchase of land, or current maintenance, bore no interest whatever. The liquidation of the former extended over fourteen years, of the latter to twelve months, both by grand jury presentments.

The sum expended on the establishment proper of district asylums, and the purchase of land attached to them, may be set down in round numbers up to the close of last year at a million two hundred and

fifty thousand, of which the original Commissioners spent £210,000, the Board of Works, £390,000, and the present Commissioners of Control, £486,000, independent of works now in operation, £90,000, but inclusive of works not as yet brought under repayment. To the above may be consistently added £74,000, the value of the Richmond Asylum, fully furnished at the time with other appurtenances, presented as a gift to the metropolitan counties.

The concession of interest on a principal, the repayment of which extended over a period of fourteen years, would be as nearly as possible 33 per cent. in value, a sum equivalent to a third of the loan ; so if the calculation be correct, on a million one hundred and seventy-six thousand pounds—not taking the gift of £74,000 into consideration—this country has had a clear and exceptional benefit of £390,000.

Prior to the 31 and 32 Vic., c. 97, the audit of the Irish Asylums accounts was carried out in London by the Commissioners at Somerset House. For the past eight years these accounts have been scrutinised at each institution by the auditors of the Local Government Board ; their examination of them, according to the amount of expenditure, occupying from three to ten, or more days. The total sum within the period mentioned, reached £1,555,959 10s. 6d. ; and we can adduce no more convincing proof of the satisfactory working of Irish district asylums—of the attention bestowed on their fiscal management, than that the strict and impartial investigators into all the particulars connected with their general and incidental expenditures, have not deemed it necessary to enforce the payment of a single disallowance ; minor irregularities, admitting of explanation, may have occurred, or oversights speedily amended ; but we may add that the reports submitted to us by the auditors under the Art are, without exception, highly favourable.

In the twelvemonth terminating on the 31st December, 1876, the total outlay, as audited, was £192,265 15s. 5d. On the 1st of January, same year, there was a balance to the credit of asylums of £33,730 18s. 5d. ; a sum of £106,615 8s. 10d. was advanced from the Paymaster-General ; the Treasury rate in aid was £77,907 ; £3,366 14s. 11d. was received from friends of paying patients, and £4,377 16s. 3d. from miscellaneous sources. A balance of £33,692 3s. was consequently left available on the first day of January, 1877.

(To be continued.)

IRISH MEDICAL ASSOCIATION.

ANNUAL GENERAL MEETING,

Held at the ROYAL COLLEGE OF SURGEONS IN IRELAND *on* MONDAY, THE 3RD JUNE, 1878.

DR. A. O'KELLY NOLAN (Gort.), Vice President for Connaught, in the chair.

REPORT OF COUNCIL FOR THE YEAR ENDING 31ST MAY, 1878.

Continued.

Medical Witnesses at Coroners' Inquests.

It will be remembered that, at the last Annual General Meeting, the Association was informed that the Council had instituted legal proceedings in the Court of Queen's Bench, Ireland, by which this Association objected to the payment of a fixed salary, instead of fees per inquest, to the coroner's medical witness ; and, secondly, to the appointment of a standing medical witness instead of the employment, in each case, of "a legally qualified medical practitioner, being at the time in actual practice, at or near the place where such death happened," as violations of the Act of Parliament ; and the case "The Queen at the prosecution of Jacob *v.* Finlay" was heard before the Court of Queen's Bench on the 17th and 19th November last. The judgment of the Court confirmed the views held by this Association, and decided that the custom then prevailing in Dublin was illegal, objectionable, and contrary to the policy of the law, but directed that, as no corruption was charged, or appeared to have taken place, and as the ratepayers had rather gained pecuniarily by the arrangement which had been a long time in existence, each side should pay its own costs. Owing to the many postponements of the trial, the costs were greater than they would otherwise have been, and amount to the sum of £76 16s. 10d., which includes all the expenses of the Association connected with this case. However, your Council trust that no further necessity will arise in this matter for legal proceedings to be taken by the Associations to enforce observance of the Act of Parliament, th eCourt of Queen's Bench having most emphatically pronounced that the arrangement complained of is contrary to the policy of the law.

Your Council are informed that the Corporation of Dublin have, since the above case was decided, obtained an opinion of Counsel regarding the matter ; and, acting upon the advice received, have discontinued the practice objected to by this Association ; but as it appears that hitherto coroners have not been informed by the police of the name and address of a medical practitioner, qualified as the Statute directs, to be summoned by the coroner to give evidence at each inquest, your Council addressed a letter to the Inspector-General of the Royal Irish Constabulary, and also the Chief Commissioner of the Dublin Metropolitan Police (to each of whom a copy of the judgment above referred to was forwarded), calling their attention to the 33rd Section of the 9th and 10th Vic., cap. 37, in the hope that they might see fit to issue instructions to the police, when giving notice of violent or sudden deaths to coroners, that they shall, in future, inform them of the name and address of the legally qualified practitioner (if any) who was in attendance upon the deceased at or about the time of death, or of the name and address of the legally qualified practitioner "at the time in actual practice at or near the place of death," with a view to his being summoned by the coroner to give evidence at the inquest. The Inspector-General of the Royal Irish Constabulary, in acknowledging the receipt of the letter sent to him thanked the Council for the suggestion offered, promising that it should receive due consideration, and soon afterwards issued instructions to the constabulary in accordance with the suggestions of your Council ; but as the Commissioner of the Dublin Metropolitan Police did not reply to the communication addressed to him, your Council subsequently forwarded another letter to him, bringing the matter again under hisnotice, and repeating the request made ; whereupon a lengthened correspondence ensued between your Council and the Commissioner (which was published in the Report of Council for the quarter ended 31st March last, and which will be found in the appendix of this Report), which your Council did not consider satisfactory ; it was therefore considered necessary that this correspondence should be brought under the notice of His Grace the Lord Lieutenant, and it was accordingly forwarded to the Chief Secretary for Ireland with that object, from whom an acknowledgment of the receipt of the communication has been received.

A complaint having been made to your Council, that, on the 7th of July last, an inquest was held, at which the coroner who held the inquest employed as medical witness a practitioner who resided over twenty miles from the place where the death occurred and the inquest was held ; your Council adopted a resolution detailing the circumstances reported, and requested that the coroner would offer any explanation he thought fit as to his action, which appeared to be a distinct violation of the Act of Parliament ; to which the coroner replied in a very unsatisfactory manner ; and your Council found it necessary to submit a case for the opinion of counsel, comprising not only the question of the meaning of the words "at or near," but also all the other points connected with the qualifications (defined by law) of the medical witnesses to be employed at coroners' inquests. In the case referred to, the complainant stated that he had been notified by the police to hold himself in readiness to attend the inquest, and that, at considerable inconvenience not only to himself but also to his patients, he had done so ; that on the second day following that on which the inquest was held he was casually informed of the fact, and he therefore considered it his duty to report the matter to your Council.

When the case of the Queen at the prosecution of Jacob *v.* Finlay was before the Court of Queen's Bench, the Court expressed their opinion that although a medical witness residing in a town might, by a stretch of language, be said to reside near the place of a death which occurred in the town, yet in the country the case would be quite different.

Mr. Robert O'Brien Furlong was consulted, and he has stated as his opinion—

1. That under the 22nd section of the Coroners' (Ireland) Act, in cases where the cause of death is not apparent (*i.e.*, neither accident nor violence), it is the duty of the police to make inquiry as to the fact of a medical man having been in attendance on the deceased—information on this point being material to enable the coroner to decide as to the necessity for an inquest.

2. The summoning of a medical witness is a matter for the discretion of the coroner; but if he should come to the conclusion that medical evidence is necessary, he is bound to summon a legally qualified medical practitioner being at the time in actual practice at or near the place where the death happened. He is clearly of opinion that a coroner is bound to give effect to the words "at or near" in section 33; and that in the case recited the coroner acted in direct violation of the letter and spirit of the statute.

3. He has no doubt as to the illegality of the coroner's conduct in the case recited, and he does not think the reasons given by the coroner in his letter afford the slightest justification for it. He also states that in the recent case, the Queen (Jacob) *v.* Finlay, the Court of Queen's Bench expressed their opinion that although a doctor residing in a town might, by a stretch of language, be said to reside near the place of a death occurring in such town, yet the case would be quite different in a county; and he is clearly of opinion that the Court would condemn the transaction complained of as illegal if brought before them.

4. He is of opinion that a notice should be served on the Secretary of the Grand Jury, cautioning him, and the Finance Committee, against making any payment for expenses of witnesses except to the coroner, and to him only when the payments are legal; and calling his and their attention to the illegal practice complained of; and that notice should also be served on the coroners cautioning them against any further violations of the law.

5. A coroner is liable to a criminal information, or he may be indicted, for any wilful neglect in the performance of the duties of his office. Section 42 provides that upon any coroner being convicted of wilful neglect of duty, the Judge of Assize before whom he is convicted may direct that he shall be removed from his office, and if so removed he becomes incapable of again being elected as coroner. In the case recited, the coroner certainly acted in violation of the provisions of the statute, and had no authority to summon the medical witness employed; and it might be concluded that this was such a wilful neglect of duty as would render the coroner liable to criminal proceedings.

6. The only remedy open to querists to put a stop to the illegal practice complained of is to apply to the Court of Queen's Bench for a criminal information against the coroner for wilful neglect of duty in disobeying the duty imposed on him by the statute, of summoning a medical witness (if he deemed the attendance of such a witness necessary) in actual practice at or near the place where the death occurred; the granting of such an application is a matter for the discretion of the Court, and would, of course, very much depend upon the particular circumstances of each case.

7. If the accounts of the Grand Jury, in which the payment of the medical witness employed in the case complained of have not as yet been audited, objection should be made to that payment when the audit takes place.

The coroner referred to in this instance is not only a medical practitioner but also a member of this Association; but your Council, although considering that these circumstances tend rather to aggravate his offence, hesitate in view of the result, to apply to the Court of Queen's Bench for a criminal information against him, and trust that by communicating to him this opinion of counsel, and cautioning him against a repetition of the offence complained of, they may be spared the necessity for further action with regard to this matter.

CURVATURES OF THE SPINE TREATED BY SUSPENSION AND THE PLASTER OF PARIS JACKET.

By LAMBERT H. ORMSBY, M.D., F.R.C.S.,

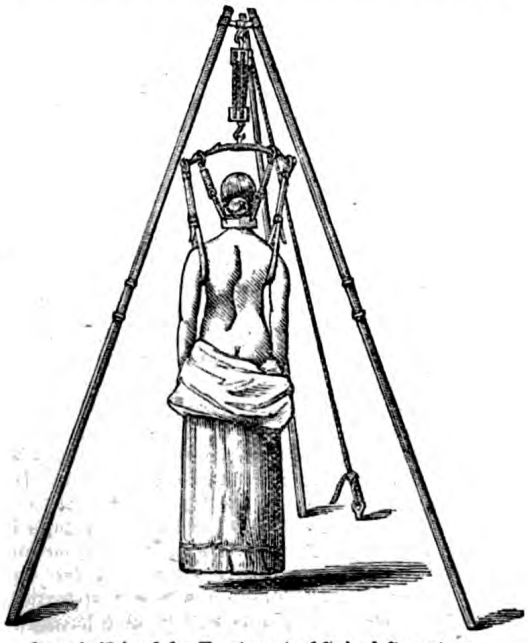
Surgeon to the Meath Hospital and Co. Dublin Infirmary, and to the National Orthopædic Hospital of Ireland.

Some nine months ago I published in the pages of this journal an account of the treatment of spinal curvatures by means of the plaster of Paris jacket in the National Orthopædic Hospital of Ireland (7 Upper Kevin Street). Since that time I have treated over a hundred cases, in hospital and private practice, and have fully considered the method in all its bearings, and for practical purposes I will divide the cases that came under my observation into three classes :—

1. *Cases where the treatment was eminently useful.*
2. *Cases where the treatment was partially useful.*
3. *Cases where the treatment was useless.*

As many of the readers of this journal may not have seen the apparatus, the accompanying wood-cut gives them a very fair idea. It consists of an iron or wooden tripod which stands from 8 to 10 feet from the ground ; from a hook at the top of the tripod, we have a double block and pulley suspended, to which is attached below a horizontal bar made of iron or brass ; from this bar is attached a leather collar well-padded, which encircles the neck, exerting pressure on the chin and occiput ; two straps also pass under each arm-pit, which are attached to extreme ends of the bar.

The patient suffering from curvature of the spine is then secured by buckling the cervical collar, the straps passed under each arm-pit so as to prevent the patient from being entirely suspended from the head and neck. The cord is then tightened by the action of the block and



Sayre's Tripod for Treatment of Spinal Curvature.

pulley, and the patient is then slowly and gently raised from off the ground. The weight of the lower extremities has a tendency to keep the body in a state of perpendicular extension, while the head and shoulders are fixed and stretched by the action of the block and pulley from above.

When the patient is slowly raised from the ground, if the spine is closely examined some curvatures to a great extent disappear, the angularity becomes less and less apparent after a few minutes' suspension. On lowering

the patient to the ground the angularity or lateral deflexion again returns.

Sayre's plan and idea was to suggest something that would keep the spinal distortion immovably fixed in a position it assumes when the body is suspended; for which purpose, in some cases, the plaster of Paris jacket suits admirably.

This, briefly, consists of a tightly-fitting woollen vest put on the body and over the anterior portion of the thorax and abdomen; a small elongated pad is introduced under the vest. Half-a-dozen coarse muslin bandages, about three inches wide, are then completely saturated or dredged with fresh dry plaster of Paris, the bandages are then placed *end* upwards in a vessel of water which must completely cover the bandages. When all bubbles disappear on the surface of the vessel containing the bandages they are completely saturated, and are quite ready for use.

The patient is then suspended by tightening the cord attached to the block. The operator takes the first bandage out of the vessel and begins to roll it round and round the body over the vest, while an assistant assiduously smooths the bandage evenly round the body and rubs fresh plaster into the wet bandages if necessary. Bandage after bandage is thus applied in the same way. When enough bandages are applied, which vary from four to six, the patient is still kept suspended, for a short time till the plaster sets and hardens, and a perfect mould of the body is thus formed. Strips of tin have been recommended to be inserted under the bandage at the back to give support and stability to the mould. These, however, I find are not necessary. Great stress has been laid on the way the patient is to be removed from off the tripod, directions being given that the patient should be grasped by the head and feet by two assistants, and carried in the perfectly extended position and laid on a flat bed or table, so as to allow the mould to set more perfectly. Other surgeons considered this point so particular that they have gone to the trouble of suggesting swinging-doors placed under the tripod so as to accommodate the patient and prevent the possibility of bending the body. These directions I believe not to be at all necessary if the surgeon uses good freshly-ground plaster of Paris. I always heat the plaster before the fire before using it, and I find that the plaster sets in some cases far too soon, and before the jacket is completed the mould is as hard and stable as possible, and the patient may then be gently lowered to the ground without any fear of the mould yielding and allowing the distortion to return.

Such is a brief outline of the manner and application of the plaster of Paris jacket. The muslin, I may mention, can be purchased at any of the large marts at 3d. per square yard, which will make at least six bandages. I find, however, that the jacket is not without disadvantage:

First. In extreme angular curvature this unyielding case frequently produces what are called *pressure-sores* on the prominent sub-cutaneous bony points, which at times give rise to great uneasiness. In one case I put on the jacket one day and had to take it off the next; owing to this fact the patient could not bear it, and when I did take it off I found the prominent bony points in the angular curvature red and slightly abraded, even after a few hours' pressure. The remedy is simple: where you anticipate pressure-sores cover such points with good adhesive soap-plaster, and over that place a small pad of cotton-wool. This, in most cases, will obviate the difficulty.

The second disadvantage is, should the plaster be kept on for a few weeks, as in all cases it should to be of any use, that at the end of a month or five weeks the patient feels very uneasy or itchy, a feeling which, in most cases, is due to the development of myriads of pediculi corporis, owing to the pent-up perspiration and sebaceous secretion, &c. These pediculi I find in all classes of society, where the jacket has been kept on for a period longer than a month or five weeks. For this disadvantage I have suggested a remedy, which I find to be completely effectual: The night before the jacket is used, I steep the woollen vest in a solution of corrosive sublimate, strength 20 grains to the ounce of water, and I find that in no case where I have steeped the vest in this solution, afterwards drying it before applying, were there any pediculi developed.

As regards removing the plaster of Paris jacket, there are many ways suggested—viz., cutting-pliers, &c.; but all such instruments have failed to a great extent, and what I suggest for removing the jacket is very simple, viz, a Hey's saw. I begin opposite the supra-sternal notch, and saw in an even line down the centre of the sternum. The saw cuts the plaster evenly, neatly, and completely in a very few seconds; a piece or strip of lead or tin may be inserted under the mould, so as to prevent the skin being rubbed or wounded by action of saw. Another point in the use of the jacket may as well be mentioned. It is not clearly laid down how long the jacket shall be left on until another is applied; I should say from five to six weeks is the longest time any jacket should remain on. I also would suggest that the patient be suspended for five or ten minutes three times a week, while the plaster is on. By this plan an improvement in the condition of the spine is encouraged, and by means of the next jacket some little may be gained as regards the gradual obliteration of the curvature. In this method it can be easily seen that a progressive improvement is hoped for. In the ordinary methods all that is aimed at is not to cure the curvature, but to prevent it getting worse, while the mechanical spinal supports in general use do nothing more or less. Having paid a considerable amount of attention to this subject, I am surprised to find so many suffering from spinal distortion, lateral or otherwise, particularly in growing girls. All dressmakers know how often they have to arrange the padding in ladies' dresses, so as to make up for want of symmetry at one or the other side. In early stages such distortion can easily be rectified by judicious treatment, but as patients in most cases are not conscious of anything of the kind existing, they seldom apply for treatment until the curvature is considerably advanced, and tell you frequently that they date this curvature to a fall or strain the child received at a certain date, while all the time it has come on gradually and slowly, being in some cases a growth of years, and not really attributable to any fall or strain; but perhaps to obliquity of pelvis, from standing on one leg, or having one leg longer than the other, as in hip disease; continued distorted position, in which the body is kept at certain trades and callings, or debility or paralysis of one set of spinal muscles, or perhaps to carious softening of the vertebræ. Such causes as the foregoing play an important part in the production of such curvatures.

(*To be continued.*)

HYDROPATHY.

By E. MARLETT BODDY, F.R.C.S., F.S.S., Etc.

(*Continued from page* 39.)

It would be next to useless to enumerate the constituents of water, but I must direct the serious attention of the reader to the undeniable fact that in pure water there is nothing of a pernicious nature, and nothing injurious to patients, let their diseases be what they may. However, a few remarks upon the operation which copious ingestion of cold water has upon the urine, will not be irrelevant, so we may as well, before we proceed further, consider the effect it has upon that secretion. The constituents are increased, and its quantity also; sulphuric acid, urea, phosphoric acid, and the chloride of sodium, are severally augmented, the chloride of sodium temporarily, the others permanently. Thus we see the effect which the ingestion of cold water has upon the urine is nothing to speak of, if pure, and consequently is harmless; and as it is an active disintegrator and eliminator, we can come to no other conclusion but that it is a useful medicinal agent, assisting

the elimination of many impurities which collect in the system during disease. We may designate it truly a natural tonic which has been given us by a highly beneficent Providence to slake our thirst in health, and to refresh us while on the bed of sickness.

The following short account of an interesting case will show the health-restoring properties of cold water, and even the nutriment that may be conveyed by it into an enfeebled constitution :—

An old woman, sinking through sheer inanition, had been unable to take any solid food for some time, and at last was unable to retain even liquid, so that she was slowly starving, for everything which she swallowed was immediately rejected. This became incessant, everything which I administered to her medicinally was useless, owing to the vomiting. I now bethought me of cold water, and to it I immediately resorted, and to the patient's great pleasure "it abided down," as she expressed it. Nothing more could this old woman take, and she lived upon it three days over a week, and eventually recovered. Now, in this case cold water was the drink, the food, and the medicine, and I am sure if she had not drunk it she would have succumbed to her distressing and enfeebling malady.

Another case which I will cite shows the efficacy of cold water :—

A young girl, in the last stage of phthisis, could take nothing else for a week previous to death, and she told me it felt so cool and soothing to her mouth and stomach, so fresh and invigorating. In this case, when medicine ceased to ameliorate her sufferings, cold water afforded relief. As for provoking dyspepsia and diarrhœa, it did nothing of the kind; it naturally enough increased the urine, but that was more beneficial than otherwise.

Many authors wrongly suppose that the ingestion of cold water provokes diarrhœa, and consequently weakens the already exhausted system; but my experience has shown me that such an opinion is erroneous. If diarrhœa is set up, drinking cold water is not the provocative, for there is nothing in this fluid—if pure—of that tendency. Diarrhœa sets in either because the intestinal tract is endeavouring to rid itself of some irritating contents, or the constitution is in that weakened condition that the whole length of the bowel is either rendered comparatively powerless, or the mucous membrane is in a state of irritation, consequent upon the presence of disease. I do not for one moment believe that cold water could possibly originate diarrhœa. As for it producing flatulence and dyspepsia, it may do so, but only if taken in superabundance; but at any rate it does not originate them to such an alarming extent as many authors would lead us to imagine. Various other agents will originate them, and so will too great a secretion of gastric juice and indiscretion in diet; but I must confess it seems remarkably strange to me that we should fall foul of this natural element and attribute to it certain qualities which I feel sure it does not possess.

No doubt I shall evoke some surprise and incredulity amongst some when I emphatically state that I have seen more benefit accrue from the cold water treatment of rheumatic fever than from all the other various modes which are so strongly advocated. Salicylic acid has, according to many accounts, signally failed as an antidote. Lime-juice, once thought so much of, has given place to ergot, and that, too, is now almost exploded, though I must own I found it almost superior to lime juice or salicylic acid in he treatment of this fever, but I have since discovered that cold water is quite as efficacious, if not more so, and that it is a beverage palatable and medicinal, and as in all febrile conditions it assuages the insatiable thirst, promotes the elimination of lactic acid through the perspiration, which as a consequence is increased, and also considerably modifies the acute pain in the various joints, and the lithates and purpurine which collect in the bladder are being continually eliminated through the perpetual flow of cold water imbibed by the aching, thirsty sufferer. The blood being of less consistency, the heart as a consequence, is considerably relieved, and there is less chance of that organ becoming diseased. I do not mean to lay it down as a general rule that the heart will escape being attacked, but I do most decidedly think that there is not so much fear of it being affected by the fever. Of course I am presuming that the patient takes proper care of himself according to the usual mode.

In cases of chronic rheumatism I have known cold water applications to the diseased joint speedily produce ease and comfort, and the following hydropathic cure of a case of long standing affecting the knee of a middle-aged woman, is still fresh in my memory. She had been bed-ridden for nearly eight months, and when I saw her she complained of acute pain at times, which after a while passed off, giving place to a dull, gnawing sensation. She could not endure her leg to be touched, and the least movement of the bed-clothes agonised her. I concluded, at first, that it was a case of chronic rheumatic arthritis, and accordingly essayed several modes of treatment, but with no avail, the knee still continuing as swollen and as painful as ever. I now tried constant application of cold wet cloths, not forgetting, of course, a strict attention to her general health; and to my astonishment, in less than a fortnight she was up and going about her usual household duties. Many would have shunned such treatment, or would have looked upon its proposal with the eye of scorn, but subsequent cases which have come under my notice have proved to me that in many instances it is the safest, the most expeditious and the most easy, of being carried out. We are unfortunately too apt to consider cold water as beneath our notice in the treatment of disease, and to place more reliance on various therapeutic agents rather than upon the life-giving qualities of a fluid necessary to health and longevity.

The following are golden rules to go upon in all cases of fever, whether epidemic or endemic—*i.e.*, where there is fever there is unnatural heat; where there is unnatural heat there is an insatiable thirst.

Quench the thirst, *i.e.*, let the patient drink cold water at pleasure, and you must of necessity modify the heat, and by so doing you naturally reduce the fever; in other words, you are simply putting the fire out by the constant imbibition of water; and then at the same time, if you think it advisable to administer a sudorific, you may the more rapidly eliminate the fever poison through the perspiration. However, I have found cold water do more good than all the medicines which may be administered to diminish or overcome the deleterious effects of the germs of febrile disease. I do not mean to exclude the benefits arising from purgation, which is necessary in every kind of disease, both mentally and bodily.

But the most marked effects of the benefits arising from the imbibition of cold water is observable in children when they are suffering from diseases incidental to infancy, and especially so when they are attacked by measles, scarlet fever, &c. The application of cold wet cloths to the head in such cases, so as to keep it cool, is extremely effective, as it staves off delirium, and modifies it when present, and I have never seen in one single instance that its imbibition is antagonistic to the eruption peculiar to the zymotic fevers; my experience has shown me that it tends to its promotion rather than to its retardation.

The hydropathic treatment of local diseases of a scrofulous nature is of great value, for it seems to antagonise the inflammation which gradually destroys the joint, and prevents, if applied in time, the formation of those sinuses which render the limb totally useless to the patient.

In scalds and burns cold water applications are invaluable, for wet cloths spread over the injured part, and kept perpetually moist, tend to a considerable extent to prevent the formation of a superabundance of pus, and keeps down the intolerable heat, and if some of Condy's fluid be added all offensive odour is at once obviated. But in those cases which occur in boiler explosions, and in those accidents which too often take place in iron and steel works, generally so destructive in their results, such a method

of treatment is inapplicable, owing to the great shock which the entire nervous system receives, and to which the agonised sufferer succumbs rather than to the injury itself. The carron oil is to be applied in these extensive, deadly injuries; but minor cases are best treated by the simple applications of cold wet rags, and the more so when such accidents occur in childhood.

In carbuncle, after the pus has been entirely removed, the application of cold wet cloths hastens the healing process in a most marked manner, for it stimulates the somewhat sluggish recovery which is generally noticeable in all cases of carbuncle, whether the result of over- or under-living.

In abscesses, which often follow an attack of scarlet fever, the same treatment is also efficacious, and the rapidity with which the part regains itself after the application of cold water is really surprising; indeed, such treatment is the best, the speediest, and the most judicious course to pursue in all these cases.

I now come to consider the hydropathic treatment of apoplexy and other diseases affecting the brain, and which, at the present day, are so much on the increase, and are produced in too many instances by the wretched practice of too frequent a use of alcoholic stimulants, giving rise to many irritable conditions of the brain, which are extremely difficult to overcome, and especially when excessive alcoholism is the prime cause. In these cases deluging the head with cold water, and at the same time applying hot water bottles to the feet are modes of treatment, of which I cannot speak too highly, for they are as important as the active aperient generally administered. Ice is, of course, in these cases much more preferable if obtainable.

In epileptic and in infantile convulsions the same method of treatment is to be strictly carried out; in any lesion of the brain, whether traumatic or organic, cold to the head, warmth to the feet, and the administration of a searching, active purgative are highly important to the well-being of our patient, and many times I have found them of great benefit when other means have been tried and have signally failed; for by so doing we are simply following out the laws and dictates of Nature. When a person is in full bodily vigour the head is cool, the feet are warm, and the bowels are opened regularly every day; when out of health it is the reverse—the head is hot, the feet are cold, and the bowels confined. Some habitually complain of cold feet; this peculiarity I have noticed to be very common in the female sex, and which, no doubt, depends upon some irregularity of the catamenia.

In that dreadful termination of a prolonged drunken debauch, delirium tremens, or what I think should be termed a drunken madness, cold water to the head constantly applied during the sleep produced by an opiate, tends to diminish the natural heat of the brain, and reduces the delirium when awake, and then the patient must be persuaded to drink as much cold water as possible, so as to accelerate the elimination of any alcoholic fluids by micturition. No harm will accrue; the only difficulty is to get the patient to accede to your wishes, for all those whose taste is depraved by alcoholism have a great antipathy to drinking cold water.

Applying warmth to the head is much to be deprecated, for it is simply conducive to congestion and dilatation of the vessels of the brain, and is just the opposite to what is so necessary to health, and in headaches the application of warmth is always to be avoided, for in these cases like will not cure like. In headache, cold must be invariably applied, so as to constrict the vessels of the brain and prevent congestion, for we must remember that heat dilates and cold contracts, and in any lesion of the encephalon the blood-vessels are, almost as a rule, dilated, but where there is an atheromatous degeneration no treatment is of the least benefit; and the same may be said of embolism, for such morbid conditions, especially the one primarily mentioned, are always more or less present in advanced age, though heart disease in many instances gives rise to an embolus in any period of life; but we may be sure that atheroma is a silent precursor of dissolution.

Headaches arising from some gastric disturbance are also relieved by the application of cold water; but, at the same time, we must not omit to pay the strictest attention to the state of the alimentary canal, for headaches, whatever may be their origin, are always relieved by active purgation.

(To be continued.)

Special Reports.

POISONOUS TRADES AND MANUFACTURES.

ABSTRACT OF A REPORT ON THE MEANS OF DIMINISHING THE DANGERS RESULTING FROM THE EMPLOYMENT OF POISONOUS MINERAL SUBSTANCES, AS MERCURY, LEAD, ARSENIC, &c., IN CERTAIN TRADES, WITH THE EXPERIMENTS TRIED TO REPLACE THEM DEFINITELY BY HARMLESS AGENTS.

Made in the name of a Commission composed of

MM. Bernard, Lavergne, Burcker, Carnot, Gubler, Hillairet, Laborde, Napias.

By MM. GUBLER and NAPIAS. (*a*)

I.—General Considerations.

Legislation.—At the present time questions of professional hygiene have assumed considerable importance. The specific evils of trades and occupations make themselves felt in spite of the ameliorations of modern society, and diseases depending on the means of existence in the struggle for life remain as fatally attached to the workman as the chance of wounds to the soldier.

As the Universal Exhibition will attract to Paris not only hygienists, and as the newest inventions and machinery in the various branches of trade will also be on view, the Congress committee have thought the opportunity a favourable one of considering this very important social question. This report aims at furnishing a basis for the communications and discussion of the members of the Congress. It embraces a wide field, for the employment of toxic substances is not limited, and death each year reaps a rich harvest of victims.

It is difficult to estimate the number of workmen who are exposed to the injurious action of poisonous minerals. The statistics furnished by the Chamber of Commerce, Paris, 1864, are imperfect in classification. In default of precise figures on this point, we can, however, group the trades requiring the use of certain poisonous agents.

Commencing with lead, Dr. Proust in his remarkable work on "Public and Private Hygiene," has placed at our disposal the following useful table:—

Table A.—*Professions or Trades in which lead is employed in some form.*

Turners	Designers
Printers	Lace and silk workers
Lapidaries	Dress-makers
Type-founders	Workers in English alpaca
Crystal polishers	Chemists
Glass manufacturers	Glovers
Potters	Perfumers, cosmetic makers
Manufacturers of Dutch ware	Sword-belt makers
Porcelain makers	Refiners
Looking-glass manufacturers	Lead founders
Glaziers	Makers of lead (toy) soldiers
Pewterers	Forge-foremen
Enamellers	Mechanics
Gilders	Carders of horse hair
Dyers	Copper founders
Painters	Bronze founders
Colour mixers	Cameo polishers
Paper manufacturers	

(*a*) Subject of a paper to be submitted at the Congrès International d'Hygiene de Paris during the sittings from the 1st to the 10th August. This Report, extending to 37 pages 8vo, is of the greatest practical importance, and we trust our English sanitarians will well consider it before attending the Congress.

In this table lead mine workers have been omitted, but it has been shown by Dr. Francisco Jose Bayes that the workmen in such mines are liable to lead poisoning ("De l'intoxication Saturnine des mineurs de la Sierra de Gador. *Gaz. Med. de Madrid,*" 1861), Several other occupations are also omitted.

We can form a more correct idea of the prevalence of lead-poisoning by examining the following tables furnished by Dr. Hillairet :—

TABLE B, *showing occupations of patients suffering from lead colic admitted into Paris Hospitals in* 1876-77.

Profession.	No.	Profession.	No.
Hair preparers	5	Ornamentist	1
Weighers	2	Furrier	1
Apprentice (?)	1	Worker in sulphide of zinc	1
Colour-mixers	4	Worker in metals ...	1
White lead workers ...	195	Porcelain-painter ...	1
Carmen	1	Decorator...	1
Hatters	3	Painters	240
Compositors	2	Potters	4
Commissionaire du Vin...	1	Polishers	14
Chacer	1	Plumbers	19
Forgemen	3	Lace-maker	1
Tinners	5	Chemical workers ...	4
Gilders	5	Porcelainer	1
Enamellers	1	Placeur	1
Plasterers...	3	Ponceur	1
Founders	8	Paper-maker	1
Type-founders	12	Locksmith	1
Florist	1	Crystal-cutters	3
Tinman	1	Dyer	1
Chimney-doctor	1	Varnisher...	1
Desoudeurs de boits de fer blanc	4	Glass-makers	2
Guardien de la paix ...	1	Zinguerer	1
Printers	5		
Gardener	1	Total ...	573
Lapidaries	2		
Looking-glass maker ...	1	Undetermined ...	61
Morocco-leather maker...	1		
Workers in red oxide of lead	2	General total ...	634

TABLE C.—1877.

Profession.	No.	Profession.	No.
Scale-maker	1	Day labourers	11
Stuff-dresser	1	Lithographer	1
Colour-mixers	6	Lapidary	1
Bijoutier	1	Looking-glass maker ...	1
Painters	2	Joiners	2
Boot-stitcher	1	Tawer	1
White lead makers ...	164	Bronze-mounters ...	2
Braziers	9	Mechanician	1
Compositors	2	Painters	284
Wheelwright	1	Chemical workmen ...	3
Hair-cutter	1	Plumbers	15
Cartridge-makers ...	6	Potters	4
Coiffeur	1	Polishers	22
Forgeman	1	Carriage-painters ...	4
Gilders	11	Decorator...	1
Designer	1	Ponceur	1
Enamellers	12	Barer	1
Florist	1	Plater	1
Makers of colours ...	2	Solderer	1
Embossers	1	Dyers	2
Plasterers...	2	Delvers	2
Desoudeurs	3	Stone-cutter	1
Maker of mirrors ...	1	Upholsterer	1
Founders	14	Copper-turner	1
Chimney-sweep	1	Varnisher...	1
Trotteur de plomp ...	1	Glass-makers	2
Wire-drawer	1	Zinqueur	2
Garçons	4		
Homme de peine ...	1	Total	630
Printers	9		

In these tables we find representatives of all the industries signalised as leading to lead-poisoning, though we have a few examples of its accidental occurrence in individuals not ordinarily exposed to such dangers.

Ten deaths are reported in 1876 of the 634 cases—viz., painters, 5 ; lead-workers, 4 ; colour-mixers, 1.

The following tables, after the method adopted by Dr. Proust for lead, groups the employments in which mercury and arsenic are used.

TABLE D.—*Mercury.*

Workmen in mercury mines	Goldsmiths
Workmen who prepare its chemical preparations	Makers of aniline
Looking-glass makers	Gilders
Florists	Telegraph post makers
Photographers	Hatters
Skin preservers	Embossers
	Inlayers of steel cannons

TABLE E.—*Arsenic.*

Lead frame makers	Sellers of colours
Paper makers	Decorative painters
Colour mixers	Florists
Ponceurs	Aniline workers
Sizers	Founders
Imitators of satin	Makers of arsenious acid
Carvers	Makers of green skylights
Painters	Curriers
Makers of colours	Dress-makers

Confining ourselves to lead, mercury, and arsenic, and omitting other poisonous substances, as phosphorus, &c., we see in how many industries workmen employ substances injurious to health.

The attention of legislators has been drawn to these dangers, and various legislative measures have been passed to ameliorate them. We shall cast a rapid glance at the legislation of the principal European Governments. The industries of France have been the subject of various decrees, as those of 1810, 1816, 1825, 1837, 1848, 1852, 1866, 1872, ; but the spirit of our legislation has been more to secure external salubrity, in the way of protecting cultivation and the public, than the individual health of the *employés.*

Our Belgian neighbours, in their codes, pay regard both to the health of the workman and the public, whilst Prussian legislation seems to have similar provisions.

The laws of Denmark, according to her eminent hygienist, M. Schleissner, does not take sufficient account of the interests of her artisans, but there is hope of this defect being soon amended.

The Sanitary Act passed in England, 1866, deals with unhealthy dwellings, manufactories, ventilation, and offensive gasses or vapours most likely to injure the health of the work-people, and gives power to the authorities to carry out all necessary sanitary regulations.

The Swiss law, whilst protecting the public, pays particular attention to the health of the workman. It is the best law of public hygiene we have been able to compare, and we may cite a few extracts, relative to the question of professional hygiene, we are considering.

Art II.—The ateliers, machines, and engines, in all manufactures, should be constructed and maintained in such a manner as to protect as far as possible the health and life of the workman. The rooms should be well-lighted during the hours of work, and the atmosphere rendered as free as possible from dust, and the air be renewed, always in a measure proportionate to the number of workmen. All parts of the machinery and connections should be covered, and all general precautions should be taken to prevent accidents.

Art III.—All manufactures must receive the sanction of Government; the plans, arrangements, &c., must be submitted to the authorities, &c.

Art XI.—After fixing the duration of work, contains the following paragraph :

"The workmen shall have in the middle of the day, at least an hour's rest for their dinner. A suitable place, heated in winter, and apart from the ordinary workrooms, shall be provided for the workmen who partake of their food in the *fabrique.*"

In Sweden a commission has been named and a scheme elaborated to perfect their present system, and bring it more in accordance with the requirements of public and professional hygiene.

M. Le Comte De Suzor, architect, of St. Petersburg, has favoured us with some interesting particulars of the Russian provisions, from which it appears that Russian legislation leaves to the local authorities the power of arranging, that the construction of mills, &c., and the manufacture of goods,

&c., shall be carried out in a manner to satisfy the exigencies of hygiene, in accordance with the special rules existing in other countries. In Italy legislation is imperfect, though the local authorities have powers to supplement the defects in the law, and to secure the health of the workman. In Austrian-Hungary, legislation is silent relative to the protection of the *employés*, whilst in Holland, the code seems to have a greater bearing on the public health than on the individual.

This short comparative study of the legislation of foreign countries may assist us in our investigations.

We are forced to admit that foreign legislation pays greater attention to internal salubrity than our own, and an attentive consideration of the Swiss law in particular, has forcibly convinced us of the defects in our system.

We have designedly omitted legislative action on the employment of children in manufactures, though it is a subject of the greatest importance, not only in an industrial, but in a general point of view, as it affects the physical and moral development of the population. It would require a special and long report. Of late years, in almost every country, the age for children's work has been raised. We know that a certain number of employers have complained of recent legislation on this subject, as affecting commercial interests. This is a mistake we must oppose. Similar complaints have been raised in other countries, but everywhere, and notably in England, the majority of employers have ultimately received these legislative enactments favourably, as they provide for the future of industry, and have a tendency to produce healthier workmen, and a more enlightened class of artisans.

Hygiene is everywhere and always in agreement with commercial interests, "*bien entendu.*"

II.—Hygiene.

The mineral poisons used are dangerous, either by contact with the skin when manipulated in the solid or liquid state, or by contact with the skin or pulmonary or digestive mucous membranes, in a pulverulent or gaseous form. The action may be local on the skin, causing erythema, pustules, or it may slowly induce poisoning.

We need not here describe the various accidents, but we may point out the principal hygienic measures adopted against these accidents, as they refer to the individual, or the industry engaged in.

A.—Individual Hygiene.—This consists of measures to protect the skin or mucous membrane from contact with the poisons, and of prescriptions relative to regimen.

The skin is protected by clothing, gloves, &c. ; the mucous membrane by masks and respirators.

The question of clothing is of the simplest. The operative should change his clothes for work, wear solid boots ; gloves should be used in all cases possible when dealing with poisonous substances. The integrity of the skin will be best secured by frequent ablution, and *les soins de propreté.* We must thus recommend repeated washing of the hands and face on leaving work, either with pure water, or water acid, or alkaline, or containing some neutralising agent. We must confess the workmen manifest a repugnance most difficult to overcome, against these little cares of personal hygiene, and in some establishments where general baths were in use, the workmen would not employ them. They, however, frequent public baths apart from their workshops, and thus the establishment of swimming baths in industrial quarters would be of advantage.

In certain trades brushing the teeth is of the utmost importance ; as the teeth play an important part in phosphoric necrosis, we must allude to the opinions put forward by Dr. Magitot as to its production, and the rules formulated by him in a communication to the Academy of Science. Dr. Magitot blames the teeth as a cause of phosphorous necrosis, and suggests that all individuals suffering from penetrating caries should be excluded until cured.

The mucous membrane of the respiratory and digestive tracts, require masks and respirators for their protection. There are many forms of respirators, that of Tyndall is complicated, Dr. Stenhouse's is more simple.

Convenience and simplicity are indispensible conditions for the popularisation of these contrivances. Masks are of more difficult construction. We have the masks for white lead and acetate of lead workers : the mask designed and patented by M. Paris for enamellers, the apparatus of Poirel, and the mask contrived by Dr. Layet. A very simple contrivance to catch small particles of dust, consists of a simple thin veil of gauze, slightly saturated with glycerine, and M. De Freycinet notices that Mr. Bell, of Washington, near Newcastle, has improved the hygiene of his workpeople engaged on the oxychloride of lead, by compelling them to wear a veil of batiste.

For certain mephitic, deleterious, and poisonous gases, the workmen require some further protection, and various apparatus have been tried, as those of M. Galibert, Denayrouse, De Fayol, Leard, Dr. Archambault, and that in use at Mannheim. The most of these apparati are too heavy and too close, and require precaution and care on the part of the workman.

We must mention the objections made by the operatives against their use ; they ridicule their fellow workmen if they employ them, accusing them of poltroonery.

All these apparati will render greater service when hygiene is popularised, and spread from atelier to atelier, and when the workman realises the dangers he is exposed to, and the value of his health : and then when some inventor has made a light and convenient form, we may be sure it will be speedily and universally adopted. There are many other individual precautions necessary. Food should not be left, or eaten, in the workrooms. In every large establishment there should be an organised system of medical inspection.

We need not dwell on the workman's diet, as it should be based on the laws of general hygiene. Alcoholic drinks should be avoided. Milk has been vaunted as a prophylactic in mercurial and lead poisoning.

The regular use of iodide of potassium affords almost a certain cure, according to the experiments of Dr. Melsens, of Bruxelles.

(To be continued.)

Clinical Records.

DUBLIN ORTHOPÆDIC HOSPITAL.

Abstract of Eight Cases of Spinal Curvature treated by means of the Plaster of Paris Jacket.

(Reported by James F. Baird, Resident Physician).

Under the care of R. L. SWAN, F.R.C.S.I.

Case I.—J—— G——, æt. 9, admitted to hospital Sept. 27, 1877, suffering from Pott's curvature of the spine, the vertebræ implicated in the disease being the 8th, 9th, 10th, 11th, and 12th dorsal and 1st and 2nd lumbar. The history of the case was very clearly given by the father of the child, who states that when the boy was about 6 years old he overbalanced himself whilst sliding down the stairs, and fell from a height of about 11 or 12 feet. At the time he complained of very little pain, but after four or five months had elapsed he commenced to suffer very much from griping pains in the lower part of the abdomen, especially after getting out of bed in the morning. The father also began to notice a peculiarity in his gait, his body being inclined altogether to one side, neither could he stand for any time without resting the hand upon the knee ; he also complained of fatigue after the slightest exercise. From this time he steadily grew worse, the curvature becoming more prominent as the disease advanced. When admitted to hospital he presented all the characteristic signs of the disease—he had paralysis of the lower extremities.

On Sept. 28th, he was placed in the suspension apparatus and a plaster of Paris jacket applied. After two days he was allowed out of bed, and walked up and down the ward without the slightest pain or inconvenience ; he has had the jacket renewed four or five times since, and is improving rapidly. The extremities have regained their normal temperature, the face has also lost its haggard appearance, and the arc of the curve has very perceptibly diminished.

Case II.—M. H——, æt. 2, admitted to hospital Sept. 19th, 1877, suffering from anto-posterior curvature, the 4th, 5th, 6th, and 7th dorsal vertebræ being engaged.

The history of the case was obscure, the first thing that attracted the mother's attention being the peculiar grunting respiration so frequently observed in such cases. She also remarked (to use her own words) a little lump growing on the child's spine, which seemed to be gradually becoming larger. About nine months had elapsed from the commencement of the disease until she was admitted to Hospital.

On Sept. 24th she was put up in a plaster of Paris jacket. Previous to suspension a thin strip of lead was placed along the spinal column and an accurate form of the curvature taken: this was then traced on paper. During suspension the same process was gone through, and it was found that the arc of the curve had decreased very considerably.

She has had the jacket removed several times since with a very favourable result, the grunting respiration having almost entirely ceased, and the curvature is scarcely perceptible.

Case III.—A. Mc——, æt. 6, was admitted to hospital suffering from anto-posterior curvature. The case in many respects was similar to the one previously described (No. II.), the symptoms, however, were more or less aggravated, the disease extending over a longer period.

Two days after admission the plaster of Paris jacket was applied, and the boy was able to leave the hospital after a couple of days. He has been several times at the hospital since its application, and there is a well-marked improvement in his condition. He is now able to walk about without the slightest difficulty, and is free from pain.

Case IV.—H. C——, æt. 4, admitted to hospital, Jan., 1877, suffering from Pott's curvature, in the upper dorsal region of a very aggravated character. The child had been complaining for over a period of two years, and was in a very emaciated condition on admission. At this time the plaster of Paris jacket had not been in use in the hospital, and the case was treated in the ordinary way—viz., the child was kept lying on its back with a well-padded accurately-fitting Hyde's splint, the internal administration of ol. morrhuæ and syr. ferri iod. was also persevered in, together with good nourishing diet. She was improving slowly, but with great distress on movement, when, in the month of July, the plaster-jacket was first applied. She was now able to be up every day and could run about the ward; she steadily improved from this time, and was able to leave the hospital in the December following. She has been at the hospital several times since, and the improvement in her condition still continues.

Case V.—Miss W——, æt. 18, an extern patient, was brought to the hospital some time since. She has been suffering from Pott's curvature for the last ten or eleven years. There was no history as to the cause of the disease; the curvature was in the lower dorsal and upper lumbar region. For the last three years of her illness she has been quite unable to take any exercise whatever, and could not maintain the erect posture for any length of time unless propped up by means of pillows, &c. She was placed in the suspension apparatus and a plaster of Paris jacket applied, and after it had thoroughly set, with a little assistance, she was well able to walk out to her cab.

Although in her case anchylosis had been completed, there was great weakness of the erecta spinal muscles, which explained the inability to maintain the erect posture, but since the application of the jacket she has been able to take plenty of exercise, walking from her own residence to the Phœnix Park daily, a distance extending over two miles.

Case VI.—J. W——, æt. 6, of very delicate appearance, admitted to hospital suffering from Pott's curvature, involving the lower dorsal and upper lumbar region. The disease had been going on for about two and a-half years. The arc of the curve was very prominent, and the boy had partial paralysis of the lower extremities.

A plaster of Paris jacket was applied a couple of days after admission, and he has been improving every day since, all signs of paralysis having entirely disappeared. The boy has been able since to leave for his home in Kilkenny.

Case VII.—M. Mc——, æt. 2, has been suffering for the past eight or nine months from Pott's curvature, the vertebræ implicated being those of the 6th, 7th, 8th, 9th, and 10th dorsal. The curvature was not very prominent, and the child's general health was, on the whole, rather good. The grunting respiration was well marked, as was also the peculiar shooting pains about the thorax and abdomen. She has been put up several times in the plaster of Paris jacket, and the improvement in her condition is very well marked, the symptoms before-mentioned having entirely disappeared.

Case VIII.—M. G——, æt. 3, has been suffering for the past eighteen months from anto-posterior curvature occurring in the lower dorsal and upper lumbar region. The child was in a very emaciated condition on admission, and for the latter six months of its illness was quite unable to walk. She was placed in the suspension apparatus, and a plaster of Paris jacket carefully applied, and in a fortnight afterwards was able to be up and walk about the ward with a little assistance. She has since left the hospital, but is still under treatment, the mother bringing her to the dispensary once a week. She is now able to walk about by herself, and her general health is very much improved.

Special Articles.

DISTRICT MEDICAL BENEVOLENT SOCIETIES.

Charity has ever been a distinguishing characteristic of our profession. Our voluntary services to hospitals and other such institutions, afford public evidence on the point, but this only feebly represents the amount and extent of the gratuitous work done, or of the private beneficence of individual members of our profession, who in their daily round of visits find ample room for the exercise of charity. Society undoubtedly owes us a deep debt of gratitude, and it is some source of gratification to know that this obligation is to a certain extent acknowledged, in the complimentary votes of thanks to our hospitals, staffs, testimonials from grateful patients, and other similar appreciative expressions of thanks.

But a large portion of society forgets how much is owing to medical men, especially to those who are thrown by the exigencies of life into our manufacturing towns and agricultural districts. Ill-remunerated for their professional services, after doing an enormous amount of work, payment for which is neglected, after a life of self-sacrifice and devotion to the cause of humanity, death carries off a large number, who necessarily leave their widows and children if not in absolute poverty, still with narrowed means, and badly provided for the battle of life; others break down whilst engaged in the laborious discharge of their professional duties, and as they have been dependent upon health for the necessaries of life, when health is gone, the means of existence are lost; they have to appeal either to the personal charity of friends, or have recourse to some charitable institution.

In a profession with such traditions as ours, it is not to be wondered at that societies have been established to succour those who are left in indigence as widows and orphans, and to support practitioners disabled either by sickness or old age.

As an instance of how much can be done at a very moderate outlay by united action, we have great pleasure in alluding to the history and progress of the West Riding Charitable Society, whose jubilee was held on Thursday last, as announced in our issue of July 17th.

Fifty years ago, when our profession occupied a far lower position than it does at present, this Association was established by the enterprise and benevolence of a few private Yorkshire practitioners. Since that time it has pursued its career of usefulness, distributing its charity with judgment, discretion, and impartiality, and increasing each year its grants, so that it has been enabled to increase its annuities from £15 or £20, to £60, £80, and even £100.

The funds of the Society amount at the present time to over

£1,300, thanks to the economic and excellent management of the executive. This large sum has been accumulated by the annual subscriptions and donations of the members. When we consider that the annual subscription is limited to £1 1s., the amount of the reserve fund and the annuities granted seem very large, and we do not know of any other insurance or provident society which offers such advantages for such a moderate expenditure. We must, however, take into account that there are no expenses for managers or secretaries, no commissions for collecting subscriptions; that the work of the Society is performed gratuitously by the president, vice-presidents, secretaries, and stewards, the latter collecting in their districts the contributions of the members.

We have not space to explain the organisation of this Society, but should any of our readers desire to obtain further particulars, we have no doubt the courteous secretary, Mr. Wheelhouse, F.R.C.S., of Leeds, will be happy to provide them.

Such work should not be confined to one district; in other parts of England, Ireland, and Scotland, the need for such a society exists, and the example set by Yorkshire is well deserving of imitation.

We need not urge the claims for support of such a society, as they are self-apparent. By a small donation of £1 1s. a year the fortunate and opulent practitioner can participate in charity of the highest and noblest order, as he assists in relieving the distress of his poorer brethren, by succouring their widows or orphans, by helping them to maintain themselves in respectability and comfort, and to bring up and educate their children, so that they may become respectable members of society. We need not point out the favourable nature of the investment to those practitioners who are dependent upon practice for support, and who have reasonable hopes of acquiring a competency if their health be spared. But the latter factor is one not to be depended on, especially in an arduous profession like that of medicine; hence a subscription of £1 1s. per year should be spared to make some provision for those who are dependent on the health of the bread-winners. Such societies are not calculated to discourage provident or saving habits during life; and the success of the West Riding Charitable Society, to a certain extent, must be attributed to the great number of supporters and subscribers it has, who give out of their superabundance, andto the evidently economic habits of the members, so that the claims are not in excessive proportion, and are always made by persons who are deserving of assistance. One great feature of the Society is the privacy surrounding its proceedings, and the considerate manner in which the grants are made, so that the recipient does not feel humbled by accepting eleemosynary aid; so, like the quality of mercy, the charity "is twice blessed—it blesseth him that gives and him that takes."

As to the proceedings of the jubilee meeting on July 18, we may briefly say they were of a most pleasant and useful character—pleasant in the social re-union of representatives from the most important towns in the West Riding; and useful, as eighteen applicants were accorded annuities, varying from £50 to £100. The members subsequently dined at the Great Northern Hotel.

Medico-Parliamentary.

HOUSE OF COMMONS.—July 16.

On the vote for the Local Government Board of Ireland,

Mr. Meldon referred to the insufficiency of the staff of medical inspectors, the spread of small-pox in Dublin, and the fact that the constabulary were not re-vaccinated.

Mr. Gray condemned the Local Government Board as being altogether in a bad way. He compared it with the constitution of the English Board, and showed how useless and inefficient the board was, composed as it was of three commissioners. He moved the reduction of the vote by the amount of the salaries of the commissioners, £4,200.

Mr. Lowther promised inquiry into the question raised by Mr. Meldon.

Mr. Gray said there was one of the gentlemen in the department who had never done anything but sign cheques. The fact was, these gentlemen had remained too long in the office, and were too old for their position.

Mr. Meldon wished the Chief Secretary for Ireland would make a full inquiry into these matters. Under existing arrangements it was perfectly useless to expect the Local Government Board in Ireland to do their duty. If they were in no way to blame he maintained there could be no possible objection to an inquiry being made into the way in which the Local Government Board performed their duty.

Mr. Parnell observed that they obtained great good last year by the inquiry held into the management and operations of the Board of Works in Ireland, and believed similar good would result by an inquiry being held in respect of the operations of the Local Government Board.

Mr. Lowther could not see the way to an inquiry into the board at the present time.

Mr. O'Shaughnessy regretted the challenge for inquiry had not been accepted, and he had no fear but that the board would bear the inquiry.

Mr. Gray insisted upon the importance of the subject.

Mr. Meldon moved that progress be reported.

Sir M. H. Beach defended the Local Government Board and the evidence given by Mr. Banks before the committee last year.

The committee divided — For reporting progress, 32; against, 78. Majority against, 46.

Mr. O'Sullivan then moved that the Chairman leave the chair.

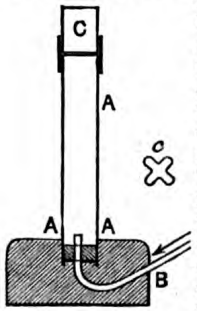
Mr. Lowther appealed to the committee to complete the remaining votes in the class.

Mr. Gray declined to put the committee to the trouble of a division in the hope that next session an inquiry would be granted. He then withdrew his motion, and the vote was agreed to.

Novelties.

A SIMPLE BURNER FOR LABORATORY WORK.

A simple and inexpensive Bunsen's burner has been devised by Dr. P. Edell (*New Remedies*), which may be constructed of ordinary laboratory materials, and which is declared by competent judges to be superior to metallic burners for observing flame re-actions. In a piece of combustion tubing, made of hard Bohemian glass, about 4—4½ inches long, two openings A, A, are blown, the edges of which are melted smooth in the flame. This constitutes the burner-tube proper. Into the lower end is introduced, by means of a cork, the curved glass tube B, the inside end of which is softened in the flame and formed into the shape indicated at *c*. The whole is held upright by being imbedded in a foot-piece made of plaster or cement, and then covered with shellac varnish. Since the upper part of the tube, by repeated heating and cooling, would acquire a tendency to crack, it is recommended to attach a shorter piece to the main tube, by means of a small rubber ring. In case of breakage this may readily be replaced.



The mortality last week in the four principal cities of the United Kingdom was 20 per 1,000 of the population in Glasgow, 21 in Edinburgh, 23 in London, and 23 in Dublin. Of the others, Liverpool gave the highest death-rate, with 29 per 1,000, but the country, as a whole, is in an exceptionally healthy state.

Deaths from small-pox have much declined in London, there were but 15 last week. Dublin, on the other hand, shows an increase of deaths from this cause; 23 having occurred last week in that city. With the hot weather, the deaths from infantile diarrhœa have increased four-fold, in Leicester they reached to 12·0 of the entire number.

WEDNESDAY, JULY 24, 1878.

MEDICAL EXAMINING BOARDS AND MEDICAL SCHOOLS.

IT is somewhat remarkable that, notwithstanding all the talk there has been about medical education, very little attention has been given to the relationship, or rather want of relationship, that has long subsisted between our medical examining boards and our medical schools. Apart from each other, the general conduct, the past and present position, and the practical work of the medical corporations and of the medical schools, have been the subject of repeated criticism, but very little has been said or written with regard to the educational connection of these bodies with each other, and with regard to their mutual co-operation in the cause of medical education.

In our last issue we briefly called attention to the large percentage of candidates, for both the membership and the fellowship of the Royal College of Surgeons, England, who failed to satisfy their examiners; and an important question arises as to what cause or causes these failures are to be attributed. It is evident that the fault must lie with one or more of the three parties concerned in the education and examination of the candidate, namely, the student himself, his teachers, or his examiners. As we have already remarked, it cannot be said that the standard of examination is too high at any of the English, and much less of the Scotch, Corporations. So far is this from being the case, the Medical Council is even contemplating making some of the examinations of a higher standard than they are at present; and we have no doubt that when conjoint boards are established their questions will be a severer test of the student's knowledge than those put by the majority of the existing examining bodies. Besides, that it is not the standard of the examination which is at fault is shown by the great ignorance displayed by a large number of the unsuccessful candidates—ignorance which can only be imputed either to their own folly and idleness, or to the inefficient manner in which medical education is conducted at the schools, and the imperfect control exercised over the conduct of medical students. Nor is the Royal College of Surgeons the only arena in which so many candidates display their ignorance of subjects on which they should be tolerably well informed. There is another examining body which has done much good in its time, and through whose portals a large majority of general practitioners have entered the profession. Owing to the frequency with which the Examining Board of the Society of Apothecaries is obliged by Act of Parliament to hold its examinations, it has not found it convenient to publish the relative number of its successful and unsuccessful candidates. But the examinations which are held every week at the Apothecaries' Hall have never, as most of us will admit, been conducted in a perfunctory manner, and, therefore, it need excite no surprise that the defective training or education of many medical students is as forcibly demonstrated by this examining body as it is at the Royal College of Surgeons. The character of the questions, both oral and written, put by these corporations respectively is well known, and no one who has carefully perused them can say that they are unduly severe, or pitched at too high a standard. With the exception of the more practical subjects, such as medicine and midwifery, the Hall examinations may appear rather below what the standard ought to be, but then it should be recollected that the subjects which the candidate for the Hall licence has to take up are comparatively numerous, and it would be unwise to expect from him so thorough a knowledge of botany, or chemistry, or pharmacy as he should certainly have of anatomy, physiology, and medicine. But in whatever light we regard the primary and pass examinations of the College of Physicians, the College of Surgeons, and the Apothecaries' Hall, it cannot be said that the standard of any of them is too high. On the contrary, if we have regard to some of the subjects on which the candidate is examined, this standard might be raised with advantage without in the least degree taxing the working powers of the dullest student, or expecting more knowledge from him than he has the opportunity of acquiring. There are certain subjects which are, in a practical point of view, of secondary importance, but that is no reason why they should be altogether ignored, and why students, who have displayed the grossest ignorance of them, should be allowed to pass because they have done better in other respects. Take such subjects as medical botany and histology. If there are good reasons for doing so, by all means let them be left out of the primary examinations. But if they are admitted the examination should not be in respect of them a mere matter of form, a certain minimum standard should be fixed upon, and if the student's knowledge does not come up to that standard he should be rejected however well up he may be in other and more important subjects.

But we have to inquire into the reasons why so many candidates are rejected by our several examining bodies, notwithstanding these bodies do not really exact from them more than they should readily know. How is it that, although the general character and scope of the anatomical and surgical questions given by the Royal College of Surgeons are well known to every medical student, and although every facility is given him for acquiring a fair knowledge of anatomy and surgery, yet a large number of those who are rejected make such blunders and show so much ignorance of the subject that it is a painful and disheartening task to look over their papers. How is it, again, that, although the Board of Examiners of the Society of Apothecaries have sent out to the schools one syllabus representing the very moderate amount of botany they would expect from every candidate for their licence to know, and another syllabus representing the equally moderate knowledge of chemistry they require of him, how is it, we ask, that students not unfrequently present themselves before that examining body who do not know a monopetatous corolla when they see it, call digitalis henbane, and henbane aconite ; or who, on the other hand, are ignorant of the most elementary facts in chemistry, and can scarcely write out with accuracy a single chemical equation ? Surely, this is a state of things that cannot be laid entirely at the door of the candidate himself ; and speaking from experience, and after due consideration of the subject, we are forced to conclude that for a good deal of this ignorance the teacher himself is partly responsible. During the period allotted for a course of lectures on either of those departments of knowledge included in the primary examinations, there is often time enough to go over two or three times the great facts and principles of the subject on which the student will be afterwards examined. But too frequently a long course of lectures means a dry and elaborate description of a variety of subordinate facts, and the consideration of certain details on which the student will probably not be asked a single question by the examining boards, or a knowledge of which he could most conveniently and profitably gather by private study. Hence, that absence of sympathy which ought to subsist between lecturer and pupil. The former fails to see the disadvantages under which every student labours who is obliged to gain a fair knowledge of a number of subjects within the short period of three or four years. He fails to put his information in the most concise form possible, to separate the wheat from the chaff, and withal to make it so agreeable and palatable that the idlest of his auditors cannot help taking away from the lecture-room a certain amount of useful knowledge that he will not easily forget. Can it therefore be wondered at that students will not often attend more lectures than they are obliged, that some teachers completely fail in gaining their interest and attention, and that the impression made upon them is often such as even to prevent them from studying in books what appeared to them so uninteresting in the lecture-room ?

Then again, the plan adopted at most of the schools, of the lecturers not signing the student's schedule unless he has attended a certain number of lectures, is no provision against his being about as ignorant of the subject at the end as he was at the beginning of the course. Much better would it be if the signature of the lecturer depended not so much upon the regularity of his attendance as upon the amount of knowledge he displayed on examination. If at the end of a course of lectures a general examination were given to the whole class, and if no pupil's schedule were signed unless he satisfied his lecturer that he possessed sufficient knowledge of the subject to carry him creditably through any of the examining boards, not only would he be forced to give more attention to the subject, either by attendance upon the lectures, or by private study, but he would without any grinding at the eleventh hour, be much better prepared for the final ordeal than he usually is, and we should not hear, so often as we do, of gentlemen knowing nothing about a subject on which their teacher had lectured them for three months. Doubtless, their might be some difficulty in carrying out this suggestion, but in our opinion no difficulty that might not be easily surmounted. It would be no hardship to the student, inasmuch as he would not be long acquiring the minimum amount of knowledge required by the lecturer, when once he found that he could not have his schedule filled up without it ; and the extra labour imposed upon the lecturer would be scarcely taken into consideration by one who was interested in the professional success of his pupils.

But when we have taken into account the defects in certain styles of lecturing, and the relationship that usually subsists between teacher and pupil, we have not fathomed all the reasons why the system of instruction pursued at our medical schools, and the great facilities presented there for students acquiring a thorough knowledge of their profession, should be so out of proportion to the results obtained, as is too frequently witnessed when the candidate presents himself for either the primary or pass examination. A little consideration will show that, although the standard of examination adopted by the several examining bodies is not too high, there are other grounds on which we find them, one and all, partly answerable for the frequency with which candidates fail to satisfy their examiners. And the point to which we would particularly call the attention of the reader, is the fact that the medical corporations have always been as it were more or less divorced from the medical schools. There has always appeared to us to be a want of that harmony, and of that mutual assistance and co-operation, that ought to subsist between two parties who have one and the same object in view, namely the sending forth into the world medical men whose general and professional attainments can claim for them the confidence and respect of the public.

It will be generally admitted that hitherto very little intercourse has been kept up between the examining boards and the schools. It rarely happens that an examiner enters either a hospital or a school unless he is one of the lecturers, or a member of the medical or surgical staff. Consequently, he does not often come into contact with either pupil or teacher. He is ignorant of what is going on at the schools, and seldom thinks it worth while, even if he be attached to a hospital, to see whether the arrangements there made are in every way calculated to give the student a fair medical education, and to make

him fit to practise with credit every branch of his profession.

Thus the teacher has little opportunity of learning from the examiner how his pupils succeed at the primary or pass examinations, and in what respects they have failed. The pupil also seldom gets any advice or encouragement from that quarter whence both advice and encouragement would be most acceptable. Now this relative position of the medical corporations and the medical schools is surely open to improvement, and it would certainly further the interests of all parties concerned, if a closer intimacy were to spring up between the examiners on one hand, and the lecturers and students on the other. If, for example, the examining bodies, or as it will be hereafter, the conjoint boards, find that candidates are constantly coming up to them very weak in some particular subject, why should they not call the attention of all the lecturers on that subject to the fact, so that some step might be taken to remedy the deficiency complained of. Or, if again they find that candidates are frequently ignorant of the several instruments and means of exploring and diagnosing disease, it should be incumbent upon them to visit all the hospitals and schools in order to see whether every student has the opportunity of becoming practically acquainted with the use of such instruments. With regard to the lecturer, we have often thought that if he could be occasionally present at the examinations of the licensing bodies, and witness the ignorance displayed by some candidates, he would be truly astonished, and certainly think that his time had been completely thrown away. Lastly, students would in a moral point of view, reap some advantage by the corporations and schools being more intimately connected with each other than they are at present. They would have more confidence in themselves, and in the justice and suavity of the examiners, while the latter would not be looked upon in that unenviable light in which they are too often regarded by the student.

We trust, therefore, that the several examining bodies will acknowledge the propriety of these remarks, and may think it worth while to carry out some of the suggestions we have ventured to make. For most assuredly it is not by the Medical Council laying down certain rules with respect to the scope and standard of examinations, nor by fixing the courses of lectures to be given at the schools, nor by their delegating from time to time inspectors to visit and report upon the examinations—it is not by such means alone that the medical education of every future practitioner in the kingdom will be greatly improved, much good would be effected by the mutual co-operation of the corporations and schools, by a closer connection springing up between them, and by the former not only insisting that every candidate should come up to a certain standard in respect of all the subjects in which he is examined, but also seeing that he has had every opportunity of gaining the knowledge exacted of him.

THE MEDICAL BILLS.

As the Parliamentary session advances towards the last days of July, the friends of medical reform are beginning to fear that the delays which have occurred may yet defeat the Bill, and that, in view of a general election, and possible ministerial changes, its probabilities of becoming law will be doubtful if the present session passes without a settlement of the question. The most serious difficulties have, it is true, been overcome, for the Government have agreed to recognise a diploma as an essential for registration, and the General Medical Council has half satisfied the direct representationists by voluntarily pledging itself to consider the amendment of its constitution next year.

There still remains a formidable opposition on the part of the Scotch bodies, who are for obstructing or defeating the measure by any means possible, and, in their interest, there are several notices on the paper to reject the Bill, and to refer it to a select committee.

The second reading is set down for the 25th, when there will remain very little time for its consideration in committee, and an insignificant opposition may succeed in defeating it. Within the last fortnight a new amendment has made its appearance on the notice paper, placed there by Mr. Freshfield, the member for Dover, who will move that:—

"Nothing in this Act contained shall extend or be construed to extend to prejudice or in any way to affect the trade or business of a chemist or druggist in the buying, preparing, compounding, dispensing, or vending drugs, medicines, and medicinal compounds, wholesale and retail, but all persons using or exercising the said trade or business, or who shall or may hereafter use or exercise the same, shall and may use, exercise, and carry on the same trade or business in such manner, and as fully and amply, to all intents and purposes, as the same trade or business was used, exercised, or carried on, by chemists and druggists before the passing of this Act."

This clause is a verbatim copy of the section in the English Apothecaries' Act, under which the counter prescribers have been prosecuted, and it has a very innocent appearance, but is, in reality, a complete charter for the prescribing druggists. Under the terms of the Apothecaries' Act the druggist can carry on his business "as fully and amply as the same trade or business was used, exercised, or carried on" before the passing of the Apothecaries' Act in 1815.

The prescribing druggists have striven to prove that counter-prescribing was the habit of the trade before 1815, and have completely failed; and they now seek to move forward the date to 1878, by which means they would, if successful, legalise the unqualified medical practice which, admittedly, has become the habit of the trade within recent years.

If the intention of Mr. Freshfield's motion be made manifest to the Government, we do not think there need be much alarm, lest it should be adopted and made law.

Indeed, we have the authority of the Duke of Richmond himself for the assurance that it is contrary to his policy to legalise unqualified practice. A deputation from the Pharmaceutical Society of England waited on him last week to urge that a clause in the original Bill, which repealed the Apothecaries' Act and protected the counter-prescribers, but which had been struck out subsequently, should be reinstated.

"The Duke of Richmond," we are told, "entered very fully into the question, and promised to give future consideration to the points urged; but he at once stated frankly that the words in the first draft of his Bill, which

had been brought forward as an argument by the deputation, were inserted inadvertently, and that he could not see his way to restoring them. Beyond this, His Grace said the Bill if passed would leave chemists in precisely the same position as that now occupied by them, and he thought under the circumstances the Medical Act would not be the proper channel through which to enlarge their privileges."

We believe that the Government is firmly decided to pass the Bill this session if it can, but it remains to be seen whether it may not be defeated in that intention by the want of time to bring the measure to a third reading.

PUBLIC HEALTH (IRELAND) BILL.

ALTHOUGH the Public Health (Ireland) Bill is not actually law it needs only the Royal Assent, and may be accepted as the statute under which the Sanitary System of Ireland is now working. It has been three years in parliamentary incubation, and has suffered autopsy by a Select Committee, and it may, therefore, be assumed to be as nearly perfect as circumstances permit. We are gratified to be able to say that it contains amendments of much importance and value to the Poor-law Medical Officers of Ireland, introduced into it at the instance of the Irish Medical Association, and acheived by most commendable perseverance exercised by that body. We may advantageously recapitulate these amendments, although many of our readers are aware of thei: 'ature.

In the first place, it has been arranged that the limit placed upon the sanitary salary of the medical officer, by which that salary was not to exceed one-fourth of his dispensary salary, shall be withdrawn, and it is henceforth in the option of the Boards of Guardians or other sanitary authority to give what salary they please, subject to the approval of the Local Government Bo This is a very important concession, for, although the medical officers have seldom received the maximum amount which the Guardians were competent to grant, yet the very fact of the sanitary salary being fixed below a small amount was equivalent to a notification to the Guardians that they were not expected to award any reasonable remuneration, and to the medical officer that he was not expected to do a reasonable amount of work. Moreover, the sanitary duty and the dispensary duty of a district have no relation whatever to each other, and it was manifestly ridiculous to make one dependent upon the other. It will be, henceforth, for the sanitary medical officer to establish for himself a claim for higher payment by exercising activity in the discharge of his duties, and should he do so, the guardians are not limited in their discretion as to his payment.

The second amendment is that by which the title of the medical officer is changed from "Sanitary Officer" to "Medical Officer of Health." This change is not without its value, for it at once raises the doctor to a level above his subordinates, and places him in his rightful position with his Boards of Guardians, and takes him out of the category of relieving officers and nuisance inspectors in which his former title had placed him.

Thirdly, the new Act grants to Medical Officers of Health a recognised fee for attending at sanitary prosecutions. It will be recollected that by their order the Local Government Board had required their officers to "attend and assist in all proceedings in which his attendance and assistance may be required," a requirement altogether beyond the powers of the Local Government Board to impose. It pleased them to consider attendance at sanitary prosecutions as a part of the duty herein set forth, and they endeavoured on all occasions to force the function upon the Sanitary Medical Officers. The clause of the new Act which removes existing doubts is as follows:

Every officer of a sanitary authority shall attend and assist in any prosecution instituted by such authority on receipt of an order from such authority so to attend: Provided always, that if a medical officer of the sanitary authority shall so attend and assist, he shall be entitled to remuneration from the sanitary authority at such rate as the Local Government Board shall approve, unless it shall have been agreed that the duty of affording such attendance and assistance shall be included in his salary, or that his whole time shall be occupied in the discharge of the duties of his office; and such payment shall be deemed to be expenses incurred by the sanitary authority under this Act, and may be recovered as part of the costs of the prosecution.

Under this clause, as will be observed, it will be necessary for Medical Officers of Health to take care that he shall not "agree" to include within their duties the prosecution of offenders unless they are properly paid for this work, for if they undertake such duty it will not be open to them to object at any future time.

There are several other amendments of minor importance, by which the medical officer receives a fee of £1 1s. 0d. for certifying a cause of death, and a special fee for attending on ship-board, and, on the whole, we believe we may congratulate the Poor-law Medical Officers of Ireland on having achieved, through the agency of the Irish Medical Association, a decided improvement in their position.

We regret, however, to have to observe that the chief hope of the Association—that they should secure proper sanitary supervision for Ireland—has not been realised. To this object the Association devoted itself with great energy, and, by the advocacy of a deputation to London, and by the mouth of Dr. Grimshaw, endeavoured, with apparent success, to impress upon the Government the necessity for providing for a proper supervision of the sanitary system in Ireland. These efforts were so far successful that the advisability of inspection was admitted by Sir M. H. Beach and other members of the Government, but the insertion of a clause in the Bill to provide for such inspection was refused on the ground that the Irish Local Government Board already possess the power to make all necessary arrangements, and that, therefore, no amendment of the Bill was necessary to effect that object. When the Bill was at its third reading in the Lower House—

Mr. Meldon said that the supervision in Ireland was totally inadequate for the carrying out of its provisions in an effective manner. The officers entrusted with the sanitary duties were the dispensary doctors, and these gentlemen, however anxious to discharge their duties in a satisfactory manner, were hampered in all directions by local influences. England had a great many more inspectors than Ireland for the carrying out the Public Health Acts. He felt that the medical profession was also of opinion that the question of supervision was an essential question.

The Attorney-General for Ireland, in reply, said the subject had been fully discussed before a select committee

in the previous year, and, while no one underrated the question, yet the whole subject must be regarded from various points of view, and it must also be remembered that the Bill contained powers for supervision, and that the only question was whether these powers were properly put into force or not.

Again, when the Bill reached the Upper House, Viscount Powerscourt put a notice on the paper to move the insertion of the following clause :—

The Local Government Board shall from time to time appoint so many fit persons as the Lords Commissioners of her Majesty's Treasury may sanction, being practising physicians or surgeons, to be inspecting medical officers of health to assist in carrying out the provisions of this Act, and may remove all or any such officers and appoint others in their stead. There shall be paid to such inspecting medical officers of health such salaries as shall from time to time be approved of by the Treasury, out of any moneys which may from time to time be provided by Parliament for that purpose. Within six months after the passing of this Act the Local Government Board shall divide the whole of Ireland into districts for the purposes of sanitary inspection, and every such district shall be subject to the supervision of an inspecting sanitary medical officer of health.

Lord Powerscourt, however, on consulation with ministers, decided to withdraw the clause upon the same ground as that urged in the Lower House.

Thus the Irish Medical Association, while it has achieved much, and succeeded in placing the medical officers of health in a far better position than they have hitherto occupied, has still before it the arduous task of securing the supervision without which the Irish sanitary system must continue to be a sham. We say the "arduous" task, because it must be evident that if supervision is to be obtained, the Irish Local Government Board must be either persuaded or coerced, and it will take continuous and persevering effort, in and out of Parliament, to do this. Our readers already know that since the day the Public Health Act became law the stubborn policy of the Local Government Board has been to neutralise its effects and annul its action. With this object in view the doctors' salaries were kept down to a minimum, energetic sanitary officers and progressive sanitary authorities were consistently snubbed, and the Local Government Board has, in fact, barely consented to tolerate such sanitary progress as it could not prevent.

Looking back upon the interval which has since lapsed, we mark the period not by any act of the Board to put the law in motion, but by occasional manifestations of a desire to prevent anything being done, and we therefore judge it to be the Board's policy to take it easy, and allow the Irish nation to grow out of dirt and insalubrity. We are glad to say that this is not the policy of Parliament, and the Irish Medical Association needs only to appeal—continuously and clamourously—for supervision, and it will get it. Until then the Irish Sanitary System continues to be a mechanism for permitting guardians (who do not want to improve the healthiness of their district) to pay to medical officers (who are given to understand that they are not wanted to do anything) a salary farcical in amount, and intended as a bribe to refrain from giving trouble by undue sanitary activity. The existence of such a system is a disgrace to the Local Government Board, and it will end as soon as the Irish Medical Association makes the facts known in Parliament.

For what the Irish Medical Association has already achieved much is due to the efforts of Mr. Meldon, M.P., and of the members of the Council who took the subject in hand in London. Mr. Meldon was untiring in his interest in the subject, and acted as intermediary with the greatest judgment, and he deserves the best thanks of the Poor-law medical officers for his exertions.

Notes on Current Topics.

The Artificial Feeding of Infants.

During the summer months children suffer from diarrhœa, and as this too often depends on improper feeding, medical men should impress on mothers the great truths established by experience as to the proper dietary of infants. The conclusions of the most experienced observers prove—

1. That milk received directly from the female breast is the natural food for infants. Every other kind of aliment must be regarded as artificial, even that drawn from the breast by mechanical means.

2. The results of artificial feeding are usually much inferior to those derived from suckling; they may be improved, but can never equal the natural source whence the infant should derive its nourishment.

3. During artificial feeding the first rule to be observed is that relating to the perfect cleanliness of all cups, bottles, &c., employed.

4. The value of any artificial food will depend much more on the easiness of digestion than on the quantity of nutritive matter which it contains.

5. In choosing as a substitute animal milk we should select that which in composition and the proportion of nutriment it contains, approaches nearest to human milk.

6. The caseine contained in different kinds of animal milk varies in its degree of digestibility, and the caseine of female milk is more readily digested than that contained in cow's milk.

7. Condensed milk is not to be preferred to fresh cow's milk, when the latter can be obtained from healthy animals fed on dry fodder.

8. The addition of sugar to the milk is liable to promote lactic fermentation, and increase the danger of infantile diarrhœa.

9. Every kind of farinaceous food should be avoided during the first two or three months, because at that age the salivary glands of the mouth digest starch incompletely, whilst those of the pancreas cannot digest it at all.

10. The majority of infants' food contains starch which has not yet been transformed, and hence it is unfit for infant food.

11. Liebig's soup is more easily digested by the infant than sweetened farinaceous liquids, because the fermentive element it contains may assist the transformation of starch into sugar after ingestion of the food.

12. Under an artificial system of feeding infants take in a much larger quantity of nutriment than they do while suckling.

13. In the majority of cases acute infantile diarrhœa is produced by the formation of an acid in the intestinal canal.

14. The green colour of the dejections also arises from the presence of an acid in considerable quantity in the canal.

15. Inasmuch as lactic fermentation may arise from either kind of sugar, this latter, as well as amylaceous substances, should not be employed during the course of infantile diarrhœa, whenever the stools are strongly acid.

The Mathematical Method Applied to Medicine.

In ophthalmology we have an example of the advantages to be derived from the application of the mathematical method, and it is a matter of regret we cannot similarly apply it to other branches of medicine, especially to experimentation with new drugs and remedies.

Inductive inference as to cause and effect at present rests upon a very unsatisfactory basis, and if we examine the treatment of certain diseases—as rheumatic fever, for which such a host of remedies are recommended, we see the desirability of a some more definite method. *Post hoc* is *propter hoc*. Salicylic acid has been administered, recoveries have taken place, *ergo*, salicylic acid is the remedy. (*Q.E.D.*)

Bicarbonate of potass has been used, recoveries have followed, *ergo*, bicarbonate of potass should be our therapeutical agent. (*Q.E.D.*)

There is a difficulty in assigning the true value to the remedy as the factor in causation.

There is a numerical method that might be safely applied in practice, and one which every practitioner can form for himself. For the treatment of the majority of diseases we presume most practitioners have some definite methods of procedure, the value of which they have tested by the results.

Now if, for instance, in any one disease, 90 per cent. of recoveries are afforded by the system pursued, the clearest evidence should be forthcoming that, by altering the treatment, 91 will recover under the new *régime*. But if cent. per cent. are restored to health under the old method, we think the practitioner having thus secured the great *desideratum*, it would be unwise, for the sake of novelty, to try a new remedy. This principle of numbers is illustrated in antiseptic surgery.

A. operates forty times with the best results, his dressings being after his own method.

B. has an equal number of operations, with a similar result. As there are cent. per cent. of recoveries *A.* and *B.* act wisely in adhering to their own plans. But the case would be different if *A.* had twenty deaths, while *B.* had none, for then there would be a legitimate reason to test the efficacy of the system by which *B.* obtained such favourable results.

We might dwell longer on the subject, as it offers ample food both for suggestions and thought.

Exactness in medical reasoning is a great want; the inductive method has assisted us, and there is an improvement in the tone of the papers read at many of our medical societies, but there is yet room for progress, which can only spring from extended education, especially in the principles of science.

Suicide of Dr. Angus Cameron.

A melancholy affair which has caused considerable sensation in medical circles in Bath where deceased was well known and respected occurred a few days ago, by the suicide of Dr. Angus Cameron, Medical Officer of the East Walcot District of the Bath Union. Upon an examination of deceased's room it was found that he had swallowed nearly an ounce of prussic acid. No reason has been assigned for the commission of the deed, but something may transpire at the inquest.

Somnambulism as a Plea in Murder.

It is not our intention now to enter into a disquisition on the various pleas that have been advanced by learned jurists from time to time in extenuation of crimes committed, our present purpose is simply to chronicle the latest phase of irresponsibility in a case of murder which came before the Edinburgh High Court of Justiciary last week. The prisoner, one Simon Fraser, was charged with having, on the night of the 9th of April last, in his dwelling-house in Lime Street, Glasgow, attacked his son, eighteen months' old, by lifting him from his bed and dashing him against the floor or walls of the house, thereby fracturing his skull and causing his death. It was stated that the prisoner was in a condition of somnambulism when he committed the crime, and that he thought when he seized his child he was preventing a wild beast from entering the bed. On several previous occasions he had risen during the night and attacked his wife and other relatives. The Jury returned a verdict that the prisoner killed his child, but that he was in a condition in which he was unconscious of the act he was committing. The case was adjourned till to-morrow, in order to consider what arrangements should be made with reference to the accused. Of course a most serious issue is raised by this case. Somnambulism is certainly not an uncommon affliction, but it is the first time in our recollection that it has been pleaded in extenuation of the crime of murder, and it is not at all improbable now that it has once been successful, that we shall hear more of sleep-walking in our criminal courts.

Poisonous Trades and the means of Diminishing their Dangers.

We have already given the programme of the International Congress on Hygiene which is to sit in Paris on the 10th proximo and following days, and as the deliberations affect equally the profession and public of this country, we have much pleasure in placing before our readers in another column the very valuable Report of a Special Commission "On Poisonous Trades" which is to be submitted to the deliberations of that assembly. At the present time this Report will be specially interesting in view of recent and promised legislations, and the numberless deaths which have been reported amongst employées in various noxious trades, the poisoning of our rivers by the discharged refuse from manufactories so engaged, &c.

Iced-Water at Railway Stations.

THE arrangement which Mr. J. P. Knight, the General Manager of the London and Brighton Railway, has just made with regard to supplying railway travellers with iced water, has attracted a good deal of notice, and probably the practice will be followed by most of the other railway companies. During the hot weather of the summer and autumn months, platform attendants will, on the arrival of a train, pass along rapidly from one end to the other proffering iced water at a penny a glass. But passengers will be requested to drink the water and return the glass with as little delay as possible. We agree with all the newspapers in hailing this innovation as a great boon to the thirsty traveller, and doubtless it will prevent many from indulging during their journey in those stimulants which are neither so wholesome nor so quenching to the thirst as water is. Unless, however, the public partake of this refreshment rather cautiously, it may, harmless though it appears, be attended with some disagreeable consequences, arising from the peculiar circumstances under which the traveller will have to quench his thirst. The short time allowed for indulging in this simple luxury will induce many to drink the iced water with a rapidity that is incompatible with either health or comfort. To drink off quickly a large draught of cold water when the body is overheated is by no means free from disagreeable or even serious consequences, especially if the temperature of the water is much reduced by the presence of ice. Severe gastrodynia, or pains in the stomach, spasm or even inflammation of this organ, and other painful affections of the stomach or bowels, have more than once resulted from taking large draughts of cold water when the thirst has been very great and the body overheated. If, however, passengers make up their mind at once on entering a station whether they will or will not avail themselves of the advantage offered by Mr. Knight, and thereby give themselves time to swallow slowly the grateful draught, no inconvenience can possibly arise, and everyone will have reason to thank the manager of the London and Brighton Railway for supplying what has been long felt to be a great want at all our railway stations.

The Perils of Fashionable Life.

BY a long and able leader in one of the daily papers, the attention of the public is called to the evils often resulting from the fashionable dissipation of a London season. The damage done to the constitution by the round of pleasures, late hours, constant excitement, over-heated and ill-ventilated rooms, exposure to sudden changes of temperature, want of sleep, irregularities of diet, imprudent indulgence in stimulants, are all graphicly set forth in the columns of our contemporary. But what is to be done to remedy the mischief? It would, perhaps, be an easier task to conquer a country than to put a stop to the frivolities and unhealthy pursuits of those fashionable men and women who stand the racket of a London season. Our contemporary wonders that medical men have not protested more emphatically against this mode of life. Singly, we are told "the more eminent members of the profession could do a great deal, while if the majority of the busiest practitioners in the West end were to steadily discountenance our present mode of life, we should very soon see it altered." Doubtless, the profession might do something to check this unwholesome state of existence, but that would not amount to much. Unfortunately, we should be contending with a condition of things over which we can have very little control. In nine cases out of ten the fashionable woman does not come under the notice of her physician until the harm is done. She does not consult him before she incurs the risk, but after she has reaped the penalty of her unnatural and frivolous mode of life. At the same time we admit that the profession have not taken the matter up as they might have done. Public hygiene has monopolised too large a share of their attention to the neglect of private hygiene, and they have witnessed with too much indifference those social abuses and irregularities to which many of the disorders common among the higher classes of society are to be chiefly attributed. If, however, physicians took every opportunity of deprecating in the strongest terms the foibles of his fashionable patients; if a knowledge of the laws of health becomes, as it one day will become, an important element in the education of every man and woman; and if, moreover, some members of the Royal Family were to discountenance some of those unhealthy habits to which attention has been drawn, we should not then meet with so many patients whose nerves have become unstrung, and whose general health has been damaged by the prolonged excitement, fatigue, and dissipation of a London season.

Lime-juice in the Treatment of Rheumatism.

AMONG the many remedies we recently enumerated as having been presented for acute rheumatism we quite forgot to mention lime-juice, although many years ago we saw this plan of treatment tried on a very extensive scale at one of our metropolitan hospitals. It appears from the *Canada Lancet* that Dr. A. H. Chandler has been adopting this treatment with success. He finds that even on the second day the amendment is decided, and the disease in acute cases quickly subsides on the fourth or fifth day of treatment. Opium was given night and morning in order to restrain the bowels, which the juice has a tendency to relax. The effects of this treatment are said to be rapid diminution of the swelling in the joints, diminished perspiration, and steady fall of the pulse, the majority of cases requiring quinine and supporting food about the sixth day. Little reliance, however, can be placed upon lime-juice as a remedy for rheumatism. After a fair trial, some years ago, in several of the London hospitals, it was finally abandoned in consequence of the repeated failures that were met with during its employment. Perhaps the much-vaunted salicylic acid may one day share the same fate, notwithstanding the remarkably good effects which have resulted from the administration of this acid.

Medical Men and Wills.

Ne sutor, ultra crepidam. This old motto should be observed by medical men. Our law courts, however, unfortunately reveal instances of our neglect of this rule, generally to the discomfiture of the medical practitioner. In the *Leeds Mercury* we have an account of a case in

which a medical man, of the name of Henry Allbutt, put his finger into a domestic pie, and Mr. Allbutt's examination will, no doubt, convince him that for the future his better plan will be to mind his own business. We might even go farther, and say that the judge might have justly and seasonably have administered a rebuke to this member of our profession.

As everyone knows, there is a Dr. Clifford Allbutt in Leeds, whose reputation is more than provincial, and though he cannot help another man bearing the same name, we sympathise with him on having it shared by a practitioner whose professional actions do not come up to our standard.

The Flaw in the Adulteration Act.

We noticed last week the judgment of the English law courts, which decided that an adulterator could not be punished for selling a sophisticated article to an inspector for the purpose of analysis, inasmuch as such article could not be said to have been sold "to the prejudice of the purchaser." In order to remedy this flaw in the Act and restore the law to its former efficiency, a Bill has been introduced into Parliament by Mr. Anderson, Sir Wilfred Lawson, Mr. P. A. Taylor, and Mr. Whitwell. It provides "that it shall be no defence to" any prosecution under this section of the Act "that the purchaser having bought only for analysis was not prejudiced by such sale." We observe that in the interest of the shopkeepers Mr. Isaacs, M.P., opposes this Bill, and considering the late period of the session, he may succeed in his opposition, in which case the public will be left absolutely at the mercy of the adulterators until next session.

A Remarkable Case of Morphine Tolerance by an Infant.

Dr. J. L. Little reports (*Am. Jour. Obstet.*, April, 1878) a case where paregoric in small doses was administered to a child three weeks old, for the relief of suffering caused by an inflammation of the knee-joint. The child gradually bore larger and larger doses—the paregoric was changed to tr. opii., and this again to Magendie's solution. Soon the child obtained such a tolerance of this drug that, in a couple of months, from half a drachm to a drachm a day was necessary to quiet it. This state of things continued until *the amount consumed by the child, then less than eight months old, was two ounces of Magendie's solution in twenty-four hours.* The dose was gradually diminished at the rate of about three drops per day, and at the time of making the report, but ten drops were given at bed-time. The child's appearance improved very much; it is intelligent, and weighs eighteen pounds.

English Victims in Turkey.

The *Stamboul* has published statistics of the English medical attendants and nurses who have fallen victims to zeal for the cause of humanity. The Stafford House Committee employed 35 doctors, 11 of whom were dangerously ill, and 2 died. The Red Crescent employed 45, 14 of whom were dangerously ill, and 7 died. The Red Cross employed 14, three of whom were severely ill and one died. The Turkish Compassionate Fund employed 11, three of whom were dangerously ill. The Charity Sisters employed 40, of whom 27 were ill, and 13 died. Total employed 145; severely ill 58; 23 died.

The Irish College of Surgeons and the Dental Diploma.

We understand that two leading committees of the Council of the above body have recommended that the powers under the Dental Practitioners' Act shall be used, and that towards the end of April an examination for the dental diploma shall take place. It is also proposed that a Board, consisting of three anatomical and surgical examiners (who must be Fellows of the College) and of three registered dentists, shall be elected by the Council at large early in the ensuing month. Dentists who can produce evidence of high moral and professional conduct (especially as regards the abstinence from advertising for a considerable period), will be admitted for the license in dental surgery without curriculum up to August 1881. After that period candidates must produce certificates of a very full course of education by lectures, hospital practice, and apprenticeship or assistantship. The College is also about to found a Professorship of Dental Surgery.

Counter-Prescribing.

"One who Prescribes over the Counter," writes as follows to the *Chemist and Druggist*:—

"The *British Medical Journal* congratulates the Medical Defence Association 'on account of its having' vindicated the law and maintained the interests and rights of their own profession and of the *public at large.* I know a town where there is an infirmary at which the dispensing is done by an unqualified dispenser and the *porter* of the hospital. A surgeon in the same town employs an unqualified dispenser; another surgeon allows his coachman to dispense some of his medicine. In another town I know two doctors who employ mere youths as dispensers."

We can assure this correspondent that, if he, or the Chemist's Trade Association will take in hand the abuses of which he complains, and put a stop to the malpractices to which he refers, none will be better pleased than the medical profession at large. We have no power to prevent individual members of the profession sacrificing public advantage to their own pocket interests, and we really do think that the chemists and druggists would occupy their energies more profitably in agitating against doctor-shopkeeping, than in endeavouring to maintain a system of unqualified practice, which, they must feel cannot be defended on any good ground.

Students and the New Medical Bill.

The *Students' Journal* hears that a clause has been inserted in the New Medical Acts Amendment Bill, which exempts students, who may have commenced their professional studies previous to the passing of the Act, from coming under its provisions.

The programme of the fifty-first meeting of the German Naturalists and Physicians (the German equivalent of the British Association) will be held this year at Cassel, from September 18 to 24. This, probably the most thoroughly scientific and efficient of all the Associations, consists of twenty-five sections, ranging from Mathematics and Astronomy to Veterinary Surgery. This year a number of addresses on leading topics by eminent men of science are promised. Among these are the following :—"On the Relation of Darwinism to Social Democracy," by Prof. Oscar Schmidt, of Strassburg ; "On Symbiosis, Parasitism, and Allied Phenomena of Life," by Prof. de Bary, of Strassburg ; "On the Education of the Physician," by Prof. Fick, of Würzburg ; "On the Physician in his Relation to Research and Natural Science," by Prof. Hüter, of Griefswald ; "On Harvey's Life and Work," by Dr. Baas, of Worms ; "On the Colour-sense and Colour-blindness," by Dr. J. Stilling, of Cassel. Many other attractions are promised, including excursions, social gatherings, and the inevitable winding up "Abschieds-Commers." The various German railways will afford great privileges to those attending the meeting.

Several substantial bequests have been received by various medical charities during the past week ; amongst which may be mentioned stock to the value of £2,316 have been presented anonymously to the Leeds Royal Infirmary. The Gloucester Infirmary has received £2,000, under the will of Mr. Charles Walker. The London, St. George's, and Royal Free Hospitals, £1,000 each, under the will of Mr. Powell, of Lime Street, City. The West of England Eye Infirmary the Royal Albert Idiot Asylum, and the Bradford Infirmary have received £500 each, under the will of Mr. Henry Brown, of Rawdon, Yorks.

At the last meeting of the Council of Queen's College, Birmingham, Dr. Sawyer was elected Professor of Materia Medica, in place of Dr. Mackey, resigned ; and Dr. Rickards was elected Professor of Pathology, in the place of Dr. Sawyer. Mr. Eales was elected additional demonstrator of anatomy ; and a vacancy being thus created in the office of medical tutor, it was resolved to advertise for a resident medical tutor, to give his whole time to the work of the College.

In the principal foreign cities the annual rates of mortality, according to the most recent weekly returns, were —in Calcutta 34, Bombay 39, Madras 36 ; Paris 24 ; Geneva 33 ; Brussels 25 ; Amsterdam 32, Rotterdam 31, The Hague 22 ; Copenhagen 23 ; Stockholm 27 ; St. Petersburg 46 ; Berlin 40, Hamburg 31, Dresden 30, Breslau 37, Munich 33 ; Vienna 27, Buda-Pesth 36 ; Rome 32, Naples 36, Turin 27, Venice 25 ; Alexandria 48 ; New York 22.

The external iliac artery was tied by Mr. Spencer Watson at the Great Northern Hospital on Wednesday last for femoral aneurism of eleven days. Antiseptic precautions and Lister's dressings were employed. The temperature has remained normal. Temperature of limb, 95·6.

We understand that of the 118 candidates examined during the last and present weeks, at the Royal College of Surgeons of England, exactly one-half (59) who presented themselves failed to reach the required standard, and were referred for three months' further anatomical and physiological study.

Literature.

A REVIEW OF THE MEDICAL WORKS PUBLISHED IN FRANCE FOR THE YEAR 1877.

(*Continued from page* 17.)

1. "Leçons de Thérapeutique du Professor A. Gubler." "Regueilles et Redigées," par le Dr. Lablanc. 1 vol. 8vo, prix 10f. Paris, Delahaye.
2. "L'Hygiene et l'Education, &c." Par le Dr. A. Riant. 1 vol. 8vo. Paris, Hachette.
3. "Clinique Medicale de la Pitie." Par T. Gallard. Paris et Londres, Bailliére.
4. "Manuel de Medicin Legale et de Jurisprudence Medicale." Par Dr. Letant. 1 vol. 12mo, 740 p., avec figures. Paris, Lauwereyns.
5. "Essa de Psychologie la Bête et l'Homme." Par Fournie. 1 vol. 8vo, prix 7f. 50c. Paris, Didier et Cie.
6. "Leçons sur les Localisations dans les Maladies, du cerveau Faites à la Faculté de Medicine de Paris." Par J. M. Charcot. "Regueilles et Publiées," par Bourneville. 1 vol. 8vo, prix 5f. Paris, Delahaye et Cie.
7. "Traité d'Hygiene Publique et Privée." Par A. Proust. Paris, Masson.
8. "Clinique Ophthalmologique du Dr. De Wecker ; releve Statistique, par le Dr. Masselon. Paris et Londres, Baillière.

1. "Lectures on Therapeutics." By A. Gubler.

The name of Professor Gubler is so well known in connection with materia medica, that his lectures hardly need any recommendation. His classification is based on physiology, a view not generally accepted, and one not always to be relied on in point of practice. In France, as in England, the study of morbid anatomy and morbid symptoms has been made the basis for therapeutical indications ; but though theoretically rational, yet as an actual fact we often derive benefit from the administration of medicines, the action of which bears no physiological relation to the symptoms.

These lectures of M. Gubler are well deserving of a place in the library of the physician.

2. "Hygiene and Education." By Dr. Riant.

This author's name is also known by other manuals on hygiene.

The present work is a valuable contribution to a much neglected subject, and will be acceptable to medical men and teachers. The hygienist's province extends over a wide field, and it could not be better devoted than to the amelioration of the physical, intellectual, and moral anæmias which are so often met with in public schools, colleges, and even universities.

3. "Clinical Lessons." By Dr. Gallard.

The real education of the student may be almost said to depend upon clinical teaching, and we owe Graves a debt of gratitude for his efforts, in connection with the Irish School of Medicine, to establish a sound and practical system, based upon utilitarianism. M. Gallard seems to have had a similar object in view in his clinical illustrations, and his work is an excellent example of the large choice of practical subjects open to the teacher, and the necessity of selecting them.

4. "Manual of Legal Medicine." By Letant.

A useful, complete, and concise work, and one that will be especially valuable to the medical jurist.

5. "A Psychological Essay." By Fournie.

Several other works have issued from the pen of this author, as the "Physiology of the Voice," &c., which have already established his reputation. The present work will prove interesting to the physiologist and thinker, as it is an honest attempt to assist the study of psychology by render-

ing its expressions more precise, and by allying it more closely to physiology.

6. "Lectures on Cerebral Localisation." By Charcot.

The name of M. Charcot has become almost identified with this theme, and we have been able during the year to present our readers with a translation of some of his excellent writings. This work should be read by all who desire to thoroughly understand the subject.

7. "Traité d'Hygiene Publique et Privèe." Par A. Proust.

We have done a great amount of practical sanitary work in England, but it has been insensibly achieved. We have not had such standard works on hygiene as our French brethren, and until the publication of the classic work of the lamented Parkes, the general practitioner did not possess a standard work of reference on sanitary science. Individual monographs and papers we had in abundance, but it remained for the industry and talent of Parkes to condense and epitomise our knowledge, and to enrich medical literature with a work of which, as a nation, we may feel proud. Hygiene has been a theoretically popular subject with French writers, and their works are characterised by an exhaustiveness, and by a thorough grasp of the wide domain over which it extends.

The work of M. Proust—of more than 800 pages—bears ample evidence of this spirit; and English readers will find treated in it nearly every subject conducive to the improvement of man's social condition, and the preservation of his physical and moral well being. It is impossible to devote space to an analysis of a work which, commencing with general anthropology, human ethnography, special ethnogenesis, subsequently includes vital statistics, on the French nation, bearing on rural and urban populations, and their influence on the wellbeing of the nation; marriage, and its effect on mortality, insanity, and crime; and hygiene proper in its relation both to the whole State and individual classes in it.

Military service necessarily has a considerable space devoted to it, and the individual is studied according to age, sex, and professions, and the diseases incidental thereto receive their due consideration.

Chapters are of course devoted to air, water, aliment, clothing, habitations, hospitals, public baths, the prevention of contagious disease, climatology, and the geographical distribution of diseases. We can confidently recommend this work as a valuable addition to sanitary medical literature.

8. "Clinique Ophthalmologique." Du Dr. de Wecker.

This little pamphlet, bearing principally on operations for cataract, will be interesting to the ophthalmic surgeon, as it furnishes statistics of 222 cases operated on by Wecker in 1876, according to the methods he has laid down, and his used both for simple linear extraction, the combined method, and that of Von Graefe.

Literary Notes and Gossip.

THE International Literary Congress, which has been sitting in Paris for the last three weeks, has just concluded its deliberations, and as this country was represented, and its decisions, if carried into practice, affect English authors equally with foreign, we append its principal clauses.

* * *

LITERARY work is as much the property of an author as his house, until he disposes of his right or the laws of the State in which he resides fix a time for expiration of such rights.

* * *

WITH regard to the copying, reproducing, or translation of works, the Congress is of opinion that the author, his heirs, or assigns, should have the power to prevent such reproduction in any country, unless a fair remuneration be paid or guaranteed by the person publishing the work.

* * *

LITERARY, scientific, or artistic works will be treated in each country as if they had been first produced in that country, and the author or publisher first purchasing or obtaining the right to publication in any country, shall have the power to prevent any other issuing or importing such work for sale in that country.

* * *

FINALLY, a committee is to be formed in each country, in connection with, and after the style of, the "Société des Gens de Lettres," with a corresponding member of the International Committee attached to each, through whom all communications between the said committee and his nation shall pass.

* * *

OF course, the work which came before the Congress was of a much more complex nature than we have sketched, but enough has been given to show authors, that what we, in conjunction with all who deplore the piracies of the past, is on the eve of being granted, and that the rights of medical men, as well as others, to their own writings will be acknowledged. To Mr. Blanchard Jerrold and Mr. E. Jenkins, M.P., the best thanks of authors are due for their labours in this direction.

* * *

DR. GRAILY HEWITT'S able lectures "On the Mechanical System of Uterine Pathology," which were delivered before the Harveian Society of London in December last, have been expanded and brought out in book form during the last few days, with some well drawn illustrations showing flexion, anteflexion, retroflexion, &c., of the organs. We were much interested with these lectures when delivered, and have no doubt we shall be still better pleased on reading the book.

* * *

A "CLINICAL Manual for the Study of Medical Cases" is announced as in the press. The editor is Dr. Finlayson, of Glasgow, who has been assisted in special subjects by several practitioners in the same city. The book will be published in London.

* * *

AN interesting production has just seen the light in the United States, under the title of "How to be plump, or talks on Physiological Feeding." By T. C. Duncan, M.D. If we may judge of its merits by the estimate of the reviewer in the *Louisville Medical News*, who describes it as "a book written in the form of a dialogue, one of the parties to the conversation apparently being an illiterate idiot, the other an uneducated lunatic," we fancy the author will lose somewhat of his "plumpness" after this, if he be a man of sensitive gait."

* * *

THE *Clinic* which has been in existence about seven years, and was at all times, a well-informed and useful weekly medical journal among our American exchanges, has now ceased to exist as a separate publication. It has now been incorporated with the *Cincinnatti Lancet*, a monthly of forty years standing, and the two as *Lancet* and *Clinic*, start this month on a new lease of life which we cordially wish may be a long one.

Correspondence.

SUPERANNUATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am in the position pointed out in the last Annual Report of the Irish Medical Association, viz., of one worn out in the service and in need of superannuation, but who *cannot calculate on obtaining the required approval of the Board of Guardians* for a retiring allowance, and therefore am obliged to hold on with the prospect (to use a vulgar phrase) of "dying in the harness." In a late interview with a member of the Local Government Board, I was told that when I took the office I had no promise of superannuation, nor any reasonable expectation thereof, and therefore I could not complain for not getting it. This is certainly a fact, and constitutes an unanswerable argument in a logical point of view. In an equitable and moral sense, however, it is surely defective. In country unions, at least, the guardians consider it—and not perhaps unnaturally—to be their chief business *to keep down the rates*, and no man is likely to get a retiring allowance unless—whatever other qualities he may have—he is a good flatterer, and if he gets

by this means the favour of the guardians, you may infer he will require but little else.

Some, whom I could name, are at present in the enjoyment of retiring allowances, who have served less time, and are apparently in much stronger health than myself. You may perhaps say "they are cleverer men, and have been—or still are—more useful to their masters" than I am. Well, I believe this may be, and most probably is, the case. But that they did their duty better, or more efficiently as Poor-law officers, I would deny, which manifestly makes for my argument. I therefore, for want of time and ability to express my sentiments better, must just content myself by re-echoing, with deep sincerity, the words of the second resolution of the late annual meeting of our Association, only altering the construction a little, viz. :—

"That, whilst it would be only an act of justice to the medical officers holding appointments in the Poor-law Service, it would also tend to benefit the public that such of these officers, as through illness or infirmity have become unfit or unable to discharge their public duties, or as have either served twenty years or attained the age of sixty should be entitled to claim superannuation allowance in amount not less than two-thirds of all their official emoluments."

I am, Sir,
Your obedient servant,
A Medical Officer of 28 Years' Service.

DEVIATION FROM PRESCRIPTIONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—May I be permitted to make a few remarks on the letter of your correspondent, "An Original Subscriber," in your issue of 17th inst., and your remarks thereon.

The question as to deviating from physicians' prescriptions you say is a breach of trust. I grant that in ordinary circumstances it is, and I think I may say, so far as my pharmaceutical brethren are concerned, never resorted to; but you would hardly expect the following prescription, handed into my establishment, to be compounded, without consulting the writer :—

℞ Mist. acaciæ, ℥iv.;
Acid hydrocyanici. dil., ℥j.;
Morphiæ mur, ℥iv.;
Syrupi. hyd. chloral, ℥vj.;
Aquæ ad., ℥vj.;
Capt. coch. mag. j., tum. urgent.

Another day I was requested to compound the following :—

℞ Magnes. sulph., ℥j.;
Acid sulph. dil., mx.;
Inf. rosæ ad. ℥j ss.;
Fl. haustus, s. s.

I quite concur with your correspondent M.P.S.I. that the title of "Medical Hall" is misleading, but I dissent from "An Old Subscriber" as regards prescribing being practised as a rule by pharmaceutical chemists.

Yours faithfully,
J. T. Holmes, Upper Baggot St., Dublin.

July 17th, 1878.

[It is hardly necessary for us to say that, in our opinion, to withhold a prescribed medicine in case of doubt, and until the prescriber is communicated with, is most proper, and it is quite open to the dispenser to refuse to compound a prescription which seems to him dangerous; but it would not, as we think, be right to alter the prescription without the knowledge of the prescriber, unless in exceptional cases where communication with him was impossible, and where the error was quite obvious. It would be utterly unjustifiable to alter the constituents of a medicine either to save trouble, or to alter the effect upon the patient.—Ed. M. P. & C.]

PRESCRIBING CHEMISTS IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—The enclosed advertisement appeared in *General Advertiser* of 29th June. I was not aware that Pharmaceutical Chemists were authorised to visit patients and prescribe for them, as this would lead one to suppose. I thought, as the law stands at present, that they were not entitled to prescribe even in their own shop (although of course they do so), much less at the patient's residence. Kindly state your views on the subject in next week's publication. Yours, &c., * * *

To Pharmaceutical Chemists, or Apothecaries—Wanted by a qualified Pharmaceutical Chemist of vast experience, a situation as Compounder or Manager; *thoroughly competent to visit and prescribe, also extracting of teeth*, well used to putting up proprietary articles, and is the inventor of several valuable remedies.

[No chemist either in or out of Ireland is legally entitled to visit or prescribe. He can do so in Ireland without hindrance, there being no law under which to prosecute him unless he falsely represents himself as being legally qualified to practise medicine. In England he can be prosecuted under the Apothecaries' Act, and it is an anomaly that no such enactment exists in Ireland.—Ed.]

Medical News.

The Cork Maternity.—The work of this useful, if unpretending institution, for the five years of its existence is before us in the form of a report of its working by Dr. H. M. Jones, the Physician to the Institution, and Surgeon to the Cork Hospital for Women and Children, and we are gratified to find that the Maternity is able to answer for itself in the most satisfactory and creditable terms.

Previous to December, 1872, there was but one other institution of the kind in Cork, with its city and surburban population of about 80,000. This opened its door also to the county, and is named the City and County of Cork Lying-in Hospital. Many years since there was a second lying-in hospital for the south side of the city, but it has long ceased to exist. The poorer classes of the city were mainly attended to by ignorant and frequently drunken old midwives, who called in no physician until they had exhausted every traditional and superstitious device to bring on labour and effect delivery. The Lying-in Hospital, imperfectly maintained as it has always been, did its work well, as far as its resources would enable it. It is only necessary to allude to the senior member of the staff, the late Dr. J. R. Harvey, Professor of Midwifery in the Queen's College, Cork, to prove the class of obstetrical work done in this time honoured hospital.

The design of the Maternity, to which we now refer, was twofold. To give efficient aid early in labour, and at any moment, to the poorer women throughout the city, and to train a better class of nurse. Up to the present, with many difficulties, and very slender resources, the Maternity has fulfilled both these objects. During the first five years 1,611 cases have been attended to in this city, and some twenty highly intelligent and competent nurses have been trained. The students of the Queen's College have largely availed of the Maternity to learn practical midwifery, and there is yearly a course of lectures on obstetrics and gynæcology delivered to the class.

Many of our cases, says Dr. Jones, were placed under the most unfavourable circumstances for recovery—poverty, filthy surroundings, over-crowded dwellings, delay, rude and barbarous interference, drunken friends, and little help in times of emergency, were the principal difficulties we had to contend with. Still it is strange that, during those five years, we have not lost a single case from puerperal fever coming on idiopathically, or having a purely septicæmic origin.

Of the 1,611 labours which occurred in the Institution, 108 were difficult, 74 preternatural, and 117 complex, and the total mortality was 14.

The forceps preferred is Simpson's long forceps, with the blades both long and strong. Also the handles are longer and roughened instead of being grooved. Of the 93 forceps cases there was one instance of death from subsequent peritonitis. This was after a very severe and prolonged effort at extraction. Of the 93 cases in which it was applied in our Maternity practice, 7 deaths of the child resulted. As to dilatation of the os, Dr Jones believes that it is essential to the safety of the mother to wait to secure *fair* dilatation, such as will admit of the application of the instrument, but not so complete as that the lips of the os may not be felt,

The further details of Dr. Jones's report are of so much interest to the obstetrician that we regret our inability to reprint them here. The entire report affords evidence of good work done under disadvantageous circumstances, and inspires hope of a future of success for the Institution under Dr. Jones's care.

University of Durham.—The following gentlemen, having undergone the necessary examination, have obtained the degree of M.D.:—William Thomas Fernie, M.R.C.S., L.S.A.; Richard Henry Milson, M.R.C.S., L.S.A.; William Summerhayes, M.R.C.S., L.S.A.—The following, having fulfilled the regulations of the University and undergone the necessary examination, were admitted to the degree of M.B.:—James D. Dixon, M.R.C.S.; — Mahony, M.R.C.S.; Shadforth Morton, M.R.C.S.; Henry E. Price, B.Sc., M.R.C.S.; A. H. Robinson, M.R.C.S.; B. R. Rygate, M.R.C.S. The examination for the M.D. degree is for practitioners of fifteen years' standing.

College of Physicians in Ireland.—At the July examinations the following obtained the licences in Medicine and Midwifery:—

MEDICINE—Samuel Bagley, Edward Bennett, Henry Foster Burnes, James Davison, John Sneyd Hawkins, Arthur Edward Pownall, Robert Leonard Rutherford, Peter Ryan.

MIDWIFERY—Samuel Bagley, Edward Bennett, Lewis Buchanan, Henry Foster Burnes, James Davision, Henry Singer Gabbett, John Sneyd Hawkins, James Bostock Jacob, Robert Joseph Martyn, John Gregg O'Neill, Arthur Edward Pownall, Peter Ryan, Robert Norman Thompson, William Cleland Wilkinson.

Society for Relief of Widows and Orphans of Med. Men.—At the last quarterly court of the Directors of this Society, under the presidency of Sir George Burrows, Bart., a sum of £1,253 was granted to be distributed, according to their circumstances, among 58 widows, 11 orphans, and 3 orphans on the Copeland Fund. The expenses of the quarter were low as usual, and amounted to £51 12s. 3d. Three new members were elected, the deaths of two members were reported. There were no fresh applications for grants.

NOTICES TO CORRESPONDENTS.

MR. MESSENGER BRADLEY'S lecture, "On Intracranial Abscess," shall appear the first week in August.

DR. HERBERT TIBBITTS.—We will look in to see the new hospital when passing.

DR. P.—We are glad to notice that Mr. Councillor W. is always on the *qui vive* to expose the many abuses of authority which, unhappily, seem very prevalent in your town. The case described in the local paper was, in every respect, disgraceful.

HEALTH OFFICER.—The report "On the Suppression of Noxious Gases," &c., will be continued in our next, and will contain the information you require. The experiments and suggestions are applicable to any country or part.

GRATUITOUS MEDICAL RELIEF.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Would you kindly inform me if the following is a fit case for out-door medical relief:—A railway porter in receipt of thirteen shillings a week with perquisites (which, say, are on an average five shillings), and is also a pensioner receiving seven shillings a week?

Yours faithfully,

P. K.

[*** The case is certainly not one deserving of dispensary relief, but, under the terms of the law which leaves it to the discretion of the ticket-issuer to decide who is a "poor" person our correspondent is bound to attend and has no remedy. In metropolitan districts charity relief is usually give to artizans whose net income is nearly as good as the doctors', and who can afford to spend one-half of their earnings in bad whisky.—ED.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The next preliminary examination for the diplomas of Member and Fellow will be held on Tuesday, Wednesday, and Thursday, the 3rd, 4th, and 5th September, at the University of London, Burlington Gardens, W. Candidates desirous of presenting themselves for this examination are requested to apply to the Secretary, Royal College of Surgeons, Lincoln's Inn Fields, W.C., for the prescribed form of application a month before the date of the examination, and return the same to the College not later than Monday, the 12th August.

DR. C. P. KNAPP, Wyoming, will please receive our best thanks.

H.M. NAVAL MEDICAL SERVICE.—Notice is given in our advertising columns that the next examination for candidates in the Royal Navy will be held at the London University on the 12th August and following days. The necessary forms will be supplied on application to the Director-General.

THE ROTUNDA HOSPITAL.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Would you kindly oblige me with the information as to (1) the steps and means necessary for obtaining the L.M. of the Rotunda Dublin, (2) the extent of its use as a qualification, and (3) if it is registerable in the "Medical Directory"?

Yours, &c.,

ACCOUCHEUR.

[*** The diploma from this Hospital is granted to pupils after a period of six months' attendance on the practice of the Hospital, and on their passing an examination before the Master and assistants. It is recognised by the Local Government Board as a qualification in midwifery for all hospitals and dispensaries under their control, but is not registerable. Application for admission as a pupil to be made to the Master, at the Hospital, Rutland Square.—ED.]

VACANCIES.

Birmingham Children's Hospital.—Non-Resident Assistant House Surgeon. Salary, £60 per annum, with lunch and dinner in the Hospital. Application to the Medical Board before August 2.

Bradford Infirmary and Dispensary.—Dispensary Surgeon and House Physician. Salary, attached to each office, £100 per annum. Applications, with testimonials, to the Secretary on or before July 25.

Carlow Union, Ballickmoyle Dispensary.—Medical Officer. Salary, £120. Election, July 31.

Carmarthen Infirmary.—House Surgeon. Salary, £125. Must have a knowledge of Welsh. Applications to Mr. H. Howells, 58 King Street, Carmarthen. Election, July 31.

Devonport, Royal Albert Hospital.—Resident Medical Officer. Salary, £200, with board and apartments. Endorsed "Application for Appointment" to be sent to the Committee on or before August 2.

Manchester, General Hospital for Sick Children at Pendlebury.—Physician. Salary, £300. Occupant of the post may engage in consulting but not general practice. Applications before July 29. (See Advt.)

APPOINTMENTS.

ANDREWS, Mr. W. S., House Surgeon to University College Hospital.

CASE, H., M.R.C.S.E., Lecturer on Psychological Medicine at the Middlesex Hospital Medical College.

EDGINTON, R. W., M.D., an Honorary Physician to the Birmingham and Midland Hospital for Women.

HARVEY, C. A., M.D., Assistant Physician to the Cork Lying-in Hospital.

HAWKES, J., M.D., M.R.C.S.E., Medical Officer for the St. Faith's District and the Workhouse of the St. Faith's Union.

HOLMES, W. H., L.R.C.P.Ed., L.R.C.S.Ed., Physician to the Cork Lying-in Hospital.

MCPHERSON, C., M.B., L.R.C.S.Ed., Medical Officer and Public Vaccinator for the Parish of Creich, Sutherlandshire.

MOONE, J., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Wolverhampton and Staffordshire Hospital.

POWELL, D., M.D., Assistant Physician to the Middlesex Hospital.

PRYCE, E. W., M.R.C.S.E., Assistant Medical Officer to the Woolwich Union Workhouse and Infirmary, Plumstead.

ROBINSON, A. H., M.R.C.S.E., an Assistant House Surgeon to the General Infirmary, Hull.

Births.

DOBBIN.—July 11, at Banbridge, co. Down, the wife of William Dobbin, M.D., of a daughter.

ILES.—July 12, at East Gate, Taunton, the wife of Alfred R. Iles, L.R.C.P., of a son.

Deaths.

ALLEN.—On July 5, at Gorey, co. Wexford, Martha, the dearly loved and only daugoter of John B. Allen, M.D., aged 16.

BERESFORD.—On July 18, at Narborough, Leicestershire, James Wm. Beresford, M.R.C.S.E., L.S.A., aged 62.

COCKS.—On July 10, at Falmouth, W. P. Cocks, M.R.C.S., aged 87.

FOWLER.—On July 4, at Easter-Ord, Skene, Aberdeenshire, John S. Fowler, M.D., aged 37.

FRY.—On July 10, at Frimley, Augustin Barber Fry, M.R.C.S.E., aged 35.

GRAY.—On July 13, at Ashley Road, Aberdeen, John Gray, Surgeon, formerly of Dundee, aged 80.

MUNGALL.—On July 13, at Abbotsford Place, Glasgow, Andrew Mungall, L.F.P.S.G., aged 58.

NOON.—On July 14, at Dublin, Frederick Noon, L.F.P.S.G., of Earlstown, Lancashire, aged 58.

PROSSER.—On June 18, at Tramore, co. Waterford, John H. Prosser, M.R.C.S.E., aged 61.

RUDLAND.—On July 14, at Foleshill, Warwickshire, William Goldsmith Rudland, M.R.C.S.E.

SMITH.—On July 14, at St. Helier's, Jersey, Joseph Smith, M.R.C.S.E., formerly of Wadham House, Lozells, Birmingham.

STUBBS.—On July 1, at Canning Street, Liverpool, Henry Stubbs, F.R.C.S.E., aged 69.

SWAN.—On July 14, at 33 Clarinda Park, Kingstown, Harriet, the beloved wife of Joseph W. Swan, M.D., in her 79th year.

WARD.—On July 7, at Wimbledon, William Ward, M.R.C.S.E., of Horncastle.

IRISH POOR-LAW INTELLIGENCE.

IRISH MEDICAL ASSOCIATION.

ANNUAL GENERAL MEETING,

Held at the ROYAL COLLEGE OF SURGEONS IN IRELAND *on* MONDAY, THE 3RD JUNE, 1878.

DR. A. O'KELLY NOLAN (Gort.), Vice President for Connaught, in the chair.

REPORT OF COUNCIL FOR THE YEAR ENDING 31ST MAY, 1878.

Continued.

Incorporation of the Association.

As the funds of the Association were not in as flourishing a condition as they would have been if the annual subscriptions had been punctually paid in, your Council considered it advisable that the matter of having the Association incoporated under existing Acts of Parliament should be postponed, especially as that course afforded an opportunity of revising the rules; accordingly your Council will present to this meeting a new code of rules, to the consideration of which they have devoted their most earnest and full attention, and which they believe will, if adopted, provide most thoroughly all that is necessary for the management of the Association; but as a whole year has elapsed since the adoptionat last Annual General Meeting of the resolution authorising the incorporation of the Association, your Council are advised by the Solicitor to the Association that that resolution should be submitted to this Annual General Meeting, when if again adopted and the state of the funds admit of it, your Council think the Incorporation should be proceeded with.

Superannuation to Medical Officers.

THIS very important question has for many yearsbeen the subject of frequent communications made to this Association, and your Council are deeply impressed with its importance, not only from a public but also from a professional point of view. Whilst on the one hand it is essential in the public interest that the sick poor should have the services only of medical officers who are capable of discharging their duties efficiently, it is, on the other hand, only reasonable and fair that the services of medical officers, whose health and years have been almost exhausted in faithful and efficient service to the public, should be adequately recognised. Under the present state of the law, the Boards of Guardians have a discretionary power to grant superannuation allowance to any medical officer who has become incapable of discharging his duties with efficiency—by reason of permanent infirmity of mind or body, or of old age, upon his resigning or otherwise ceasing to hold his office—in amount not exceeding two-thirds of the emoluments of his office. Your Council observe with gratification that the Boards of Guardians are much more considerate now than heretofore in dealing with the question of superannuating worn-out medical officers; but they regret that, owing to the fact that superannuation allowance is at present only permissive, there are too many instances of medical officers utterly worn out and incompetent to discharge efficiently their duties to the sick poor, who, being solely dependent upon the salary and emoluments of their office, and who cannot calculate upon obtaining the required approval of their Boards of Guardians, in the first instance, to the granting of a retiring allowance, are—through absolute want of means to support themselves without it—compelled to hold their appointments rather than incur the risk of having to be supported by charity, in consequence not of improvidence on their part, but rather of inability to make provision for themselves and their families in their old age.

Your Council are of opinion that the State should contribute to the superannuation allowances in the same proportion as it contributes to the salaries of the medical officers in office; and that superannuation allowance should be obtainable as a matter of right by those medical officers who, by reason of age, illness, or infirmity, have become unable to discharge their duties efficiently, as well as by those who have served over twenty years; and that the permissive system at present in force shall be confined to cases which would not come under those heads; and your Council are confident that, if such were the case, the result would be much more satisfactory to the public than the present system.

Your Council have received from "The Louth, Meath, and Drogheda Medical Society" a resolution adopted by its members, urging the importance of this subject, and a resolution thereon will be submitted to this meeting.

Leave of Abcence.

Under the existing regulations a Dispensary medical officer is not entitled to "leave of absence" unless incapacitated by illness or other cause from discharging his duties; in which case he is required to nominate a fit and proper person to undertake his duties; and the practitioner appointed as *locum tenens*, owing to some informality, is occasionally either unremunerated for his services or has to look to the incapacited medical officer for his salary for the time during which he was unable to discharge his duties.

Your Council believe that such a state of matters is not conducive to the well-being of the Poor-Law Medical Service, and are convinced that it would tend to the efficiency of that service, and not materially increase the expenses thereof, if workhouse and dispensary medical officers were entitled to a reasonable period of leave of absence in each year at the public expense. By such an arrangement the medical officers would be afforded an opportunity not only of recruiting their health, but also acquiring information and extending knowledge, which would in turn be advantageous to their patients and tend to diminish the number of instances of incapacitation from

illness. In the various departments of the Civil Service this system exists, and your Council cannot see any reason why it should not be extended to the medical officers of the Poor-Law Service, who certainly do not less require it. Your Council have therefore drawn up a resolution on this subject to be submitted to you this day.

The Parliamentary Franchise (Ireland) Bill.

Attention having been directed, when it was before the House of Commons, to this Bill, one of the clauses of which proposed the repeal of the 111th section of the 13 & 14 Vic., cap. 69 which disfranchises as a voter for Members of Parliament any person who, within twelve months, had received relief under the "Acts for the more effectual relief of the destitute poor in Ireland," your Council took prompt measures to oppose that clause in the Bill, and Communicated with the Attorney-General for Ireland and other Members of Parliament, the result of which was satisfactory.

The Factories' Bill.

The attention of your Council was drawn to this Bill but as it had already passed the Committee of the House of Commons at the time, your Council considered that no action on their part, further than that already taken by them in their resolution of 21st July last, would be of any use, and the Hon. Secretary of the "Certifying Factory Surgeons' Association" was informed accordingly; but your Council are pleased to report that many of the claims put forward by that Association were recognised by the House of Commons, and trust that the resolution above referred to tended, in some measure, to ensure that result, and the thanks of the Certifying Factory Surgeons' Association, for the action taken by this Association have been received.

The attention of your Council having been directed to the retirement from Parliament of Mr. Henley, M.P., they forwarded to him the following resolution, which was unanimously adopted, viz.,

Resolved—"That the Council of the Irish Medical Association, having observed that Mr. Henley, late M.P. for Oxfordshire, has retired from Parliament, and recognising the very valuable and kind assistance given by him towards the passing of "The Medical Officers' Superannuation (Ireland) Act, 1869," desire to express the deep sense of gratitude they feel towards him for his services, and hope he may long be spared, in the midst of happiness, to enjoy the rest from Parliamentary toil which he has sought."

Obituary.

Your Council with deep-felt regret have to report that sixteen members of the Association have, during the past year, been removed by the hand of death.

New Members.

Twelve new names have been added to the list of members during the past year.

ABSTRACT OF THE TWENTY-SEVENTH REPORT ON LUNATIC ASYLUMS IN RELAND.

(*Continued from our last.*)

On comparing the average cost per patient in all asylums in the two years last audited, there is a difference of only 8d., a circumstance displaying a remarkable uniformity of expenditure, and a fixed system of management; although, no doubt owing to incidental circumstances, one institution may be dearer than another. Abstracting the rate in aid £10 8s. from £24 13s. 8d., £14 5s. 8d. would represent the charge on the rates for every lunatic in an Irish Asylum during the whole of 1876, a sum we apprehend scarcely greater—all charges included—than that necessary for supporting the inmates of a union workhouse infirmary.

Before concluding this portion of our Report, we would venture to observe that if the utility of public lunatic institutions be estimated by results, the district asylums of Ireland, tested by the number of cures effected in them, by their average low mortality, by their immunity from the recurrence of fatal or serious accidents, one solitary suicide being the only untoward occurrence that took place within the year in a floating population of over ten thousand inmates, a large portion of whom were admitted as dangerous to themselves or others, as well as by their uniform, humane and economic management, may fairly compete with the best regulated of kindred establishments in other countries.

Workhouses.

In previous Reports we have so fully expressed our sentiments with reference to the unsuitability of workhouses to the treatment of lunatics, that we should only repeat ourselves did we dwell at any length on the subject at present; and we feel the less disposed to do so, as a commission of inquiry was appointed towards the close of last session of Parliament to visit these institutions. We may, however, succinctly advert to opinions which, already expressed by us, have been corroborated by a growing experience and more studied observations. At all times, as places in which cases of acute, dangerous, or complicated insanity could be treated, we have been totally adverse to them, regarding such receptacles as calculated, from their want of proper organisation, attendants, and appliances of management, as more calculated to fix than to alleviate mental disorders, no matter how intelligent the physicians attached to them, or however benevolently inclined the non-professional superintendents. In the absence of asylum accommodation, workhouses have doubless proved most beneficial to many of the insane class, by affording a certain refuge and a safeguard against personal danger, particularly to the idiotic, the epileptic, and utterly demented of the pauper community.

It will require much consideration as to how an amendment can be best secured in the general management of poorhouse inmates labouring under mental disease.

So far back as 1857, and some years prior to the erection of the intermediate establishments of Leveson and Cateram, near London, we expressed opinions, from which we have since discovered no reason to depart; and to the effect:—

"That the most suitable place for every demented person, lunatic, or idiot, dangerous or inoffensive, is an institution devoted to the care of the insane, under the management of experienced attendants well acquainted with the treatment of mental disease in every form."

And further—

"That the question was deserving the considerations of the executive of how far the separation of the insane from the sane would ensure to the former more care and comfort than they can possibly enjoy in ordinary workhouses. By the erection of distinct auxiliary buildings, a desirable object would be obtained, as on the removal of many chronic and incurable inmates, occupying a great deal of valuable room in several district asylums, the latter could be more beneficially devoted to recent or acute cases of larceny, and then efficiently serve as hospitals for the cure of insanity instead of being mere receptacles for the safe-keeping and maintenance of hopeless patients."

The Commission of Inquiry into the feasibility of amalgamating unions, whereby some workhouses might possibly be rendered available for other than their primitive object, has not as yet reported; so far, then, the transferring of an unoccupied workhouse to the lunatic department in each asylum district, should the Local Government Board sanction the procedure, must remain in abeyance.

Private Asylums.

We have to record no alteration during the past twelvemonth in the number of private asylums.

Their inmates, too, are almost the same as given in our Report for 1876, 644 and 636 being under treatment respectively at the close of last year.

As regards the management of these institutes, it has been on the whole satisfactory—many of them being conducted, with due attention to the comfort of the patients, are not inferior to similar establishments elsewhere, in neatness, order, and facilities for amusements, as well as in and outdoor occupations. Three or four certainly stood in need of improvement, the necessity of which we did not fail to impress on the proprietors. They were not, however, in such a condition as to justify an interruption of the license under which they were kept up, for though deficient in their interior arrangements, allowance should be made, not only for moderate stipends, but not unfrequently irregularities and delays in the payments of them by the friends of the insane.

In no instance have we had reason to find fault with the treatment of patients by the owners of private licensed houses—in fact, if any blame is attributable in their regard, it should be put down more to the neglect of relatives than to any other cause.

WESTPORT UNION.

DUTY OF MEDICAL OFFICERS IN CONNECTION WITH OUT-DOOR RELIEF.

THE Westport board of guardians made inquiry of the Local Government Board respecting the duties of dispensary medical officers, and received a reply to the following effect :—

In reply to the question of the guardians of the 27th ult., inquiring as to the duty of the medical officers with respect to visiting persons in receipt of out-door relief under the circumstances set forth in the minutes, the Local Government Board replied that the giving of certificates as to the state of health of applicants for out-door relief or of persons in receipt of such relief in order to guide the board of guardians in determining as to the continuance of the relief, is not a duty which the medical officer is strictly to observe. The duty of inquiring into the case of application for relief and of furnishing the guardians with such information as they may from time to time require in reference to such cases should be performed by the relieving officer. The tickets which the relieving officer is authorised to issue the medical officer are for affording medical advice and medicine to a person needing such aid ; and Article 21, No. IV. of the dispensary regulations defines the circumstances under which he can call on the medical officers for a certificate as to fitness of removal to the workhouse.

COUNTY KILDARE GRAND JURY.

CORONERS' PAYMENTS TO MEDICAL WITNESSES.

Major Borrowes—We should take into consideration how the coroners of this county are to be paid for the current expenses of the various inquests which they may be called upon to hold. Formerly, before the doing away with the Board of Superintendence, the coroners sent in an account of their expenses every month. Now that there is no Board of Superintendence, they want to know by what means they are to be paid their current expenses.

Dr. R. S. Hayes (one of the county coroners) pointed out that there was a presentment of £50 to the court-house committee passed at last assizes, which could be applied to the purpose of meeting these expenses. Since he could not be paid as heretofore by the Board of Superintendence, he had not advanced any money to medical witnesses, but gave, instead, a certificate that they were entitled to so much for attending an inquest.

Major Borrowes—I would like to know if it is legal for the court-house committe to pay this money. I certainly do not think it at all a beneficial system that your coroners are to give certificates to medical men.

Dr. Carter mentioned that he had written to Mr. Galloway, Grand Jury solicitor. asking how he was to be repaid his current expenses. Mr. Galloway, in the course of his reply, wrote :—" It appears from the last presentment made at last assizes that the sums which had been presented to the Board of Superintendence were represented in aid of the county at large, and I think therefore an application made to the Grand Jury when they next assemble, to present under the provisions of the 30th sec. 9 and 10 Vic., cap. 37, may be entertained."

Major Borrowes deprecated the system of coroners giving " I Owe You's" on the part of the Grand Jury to medical men and other witnesses who might be in want of their money.

Mr Rynd said coroners were not bound to give any " I Owe You's."

Dr. Carter said in the early part of his administration he tried the system of certificate. It was a signal failure.

Ultimately, the matter was referred to the coroners' committee, who subsequently reported as follows :—

"The Grand Jury having requested the committee on coroners' accounts to recommend some manner in which the coroners' accounts—*i.e.*, certain monthly expenses on inquests—can be met, suggest that the Grand Jury do appoint the visiting justices the coroners' accounts committee to examine and pay monthly as heretofore money due on inquests, and that a sum of £50 be presented for at each assizes to meet these expenses."

ATHY UNION.

DISINFECTION OF CANAL BOATS.

THE sub-sanitary officer of Athy presented a bill for £3 3s. 2d., the value of clothes and other articles destroyed by him when disinfecting a canal boat from which a small-pox patient, who had since died, had been taken to the workhouse hospital.

Sir A. C. Weldon.—The railway company are compelled to disinfect the trucks. I do not see why boat owners should not be subject to the same law.

Sub-sanitary Officer—I have it on good authority that the man was brought from Dublin suffering from the disease, and that he was kept in the boat from Sunday until Friday.

Mr. Mahony—If that be so the person in charge of the boat could be punished. The section of the Act bearing on this is very stringent ; it says :—Any person suffering from any dangerous or infectious disease who wilfully exposes himself without proper precaution against the spread of said disease in any public place or public conveyance, or any person in charge of one so suffering who so exposes the sufferer, or any owner or driver of a public conveyance who does not immediately provide for the disinfection of his conveyance after it has conveyed such sufferer, shall be liable to a penalty not exceeding £5."

Sub-sanitary Officer—I do not think you could come at the owner of the boat in this instance.

Mr. Mahony—You could ; he is responsible for the acts of his servants.

Sub-sanitary Officer—I can not get people to go into these places and disinfect them without paying them, and it is even difficult to get them at any price. The board should pay me, and look to the owners afterwards.

The Clerk was directed to write to the owner of the boat on the subject.

Mr. Mahony—The following section of the Nuisance Removal Act bears on it :—" Any ship or vessel lying in any river, harbour, or other water, shall be subject to the jurisdiction of the nuisance authority of the district within which such river, harbour, or other water is, and shall be within the provisions of the Nuisance Removal Act, in the same manner as if it were a house within such jurisdiction, and the master or other officer in charge

shall be deemed for the purposes of the Act to be the occupier of such ship or vessel."

The sanitary officer's attention was directed to the section, and they were ordered to attend to the resolution of the board.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JULY 13, 1878.

Total registered deaths in Dublin and suburbs*	...	...	137
Ten years average of same week	...	...	120
Excess of mortality above average	...	...	17
10 weeks' ratio of deaths Rathmines		19·7 per	1,000
„ „ „ Donnybrook†		23·6	„
„ „ „ Blackrock		12·3	„
„ „ „ Kingstown		16·3	„
„ „ Entire Dublin District		22·6	„
Comparative Ratios—London	...	23·2	„
„ „ Glasgow	...	19·5	„
„ „ Edinburgh	...	20·6	„

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Deaths from zymotic diseases are 1 less than in preceding week, but 13 over the average for the 28th week of the last ten years: they number 38, of which 23 were from small-pox, 4 from fever (2 typhus and 2 typhoid fever), 3 each from scarlet fever and diarrhœa, and 1 each from diphtheria, whooping-cough, erysipelas, and hydrophobia, the last named death being that of a girl aged 5 years, who was bitten by "a rabid dog" on 5th April last and died in Sir P. Dun's Hospital.

Of the 23 deaths from small-pox 4 are chargeable to the North City Districts, 18 to the South City, and 1 to Donnybrook. The deaths from this cause are 5 over the number registered in the preceding week, but there has been a remarkable decline in the number of fresh cases of the disease admitted into hospital, the total for the week being only 51, which is 43 under the number for the previous week, and much less than in any week for some months past. Seventy-four small-pox patients were discharged during the week, and 16 died; 197 remained under treatment on Saturday last, being 39 less than the number on Saturday, 6th instant.

Nine children died from convulsions.

Bronchitis caused 18 deaths, pneumonia 4, and lung disease, unspecified, 2; these 24 deaths are 7 in excess of the average mortality from diseases of the respiratory organs in the 28th week of the last ten years.

Three deaths resulted from heart disease; 4 from apoplexy, 3 from paralysis, 2 from epilepsy, 1 from cephalitis; 1 from jaundice; and 4 from nephria.

Twenty persons died from phthisis, 5 from mesenteric disease, 2 from hydrocephalus, 1 from scrofula and 2 from cancer.

WATERFORD GUARDIANS.

Mr. Elliot, J.P., said the police of Mullinavat came to him and asked him to take the depositions of a woman who was believed to be dying. Hs asked if a doctor had seen her, and they said that Dr. Cane was on leave, and that his substitute, Dr. Evans, was not to be found. He went, and took the woman's depositions. On his way he met the relieving officer, who told him that Dr. Evans, the substitute, had gone to Dublin. At the same time Dr. Cane drove up from Waterford, on his way to Dublin Although informed of the case, he refused to attend, and went on to Dublin also. The result was, the poor woman was left without a doctor all night, and it was only next morning that Mr. Carroll was able to get Dr. Jackman to see her, and he pronounces her life in danger.

Mr. M'Shea—The *locum tenens* had all the responsibility while he was in office, and no one else was implicated.

Mr. Carroll, R.O., stated that he received a letter from Dr. Evans, stating he could not attend, as he had to go to Dublin.

Mr. Elliot—I think that the Local Government Board should be informed that Dr. Cane, although knowing the case, went off to Dublin, and would not attend it.

LECTURES ON LOCALISATION IN CEREBRAL DISEASE.

By Prof. CHARCOT, M.D.,

Physician to the Salpetrière Hospital, Member of the Academie de Medicine, Paris; Fellow of the Clinical Society of London, &c., &c.

(*Continued from page* 284, *vol.* xxiii.)

Origin of the Cerebral Portions of the Optic Nerves.

Gentlemen,—I hope I have achieved my purpose of rendering conspicuous the existence of *crossed amblyopia* as a symptom of lesions occupying the posterior part of the internal capsule, or the corresponding radiations of the foot of the corona radiata.

At the same time I have striven to show that De Graefe's proposition—that with the exception of crossed amblyopia, homologous hemiopia would be the only functional trouble of vision which could result from a lesion of one of the cerebral hemispheres. I have tried to show that this proposition is much too sweeping, and that the arguments on which it is founded require complete revision.

I wish to-day to inquire, with you, whether normal anatomy can explain whether this sensorial trouble, this crossed amblyopia, is a frequent or habitual accompaniment of sensitive hemianæsthesia arising from lesions of the internal capsule.

This hemianæsthesia—of common sensation—is explained by a fasciculus of centripetal fibres, called *direct*, because they do not terminate in the grey nuclei of the central masses, but which, on issuing from the internal capsule, form the most posterior part of the foot of the corona radiata.

Is there any convexity—any sort of relation—between this sensory fasciculus and the sensory fasciculi which connect the visual apparatus with the grey matter of the brain?

To answer this, we must first study the deep or cerebral parts of the optic nerves. This is a difficult subject, and has its points of obscurity. Still, I cannot avoid showing you its chief aspects, if only to point out in what direction researches should be made, pathological anatomy affording the principal ground for investigating the matter.

Following the general plan, the cerebral nerves should, before penetrating the brain itself, meet with one or more masses of grey substance, which are usually called *nuclei of origin;* and there are expansions, arising in these nuclei, which would indirectly connect these nerves with the grey matter of the cerebral hemispheres.

A priori, why should the optic nerves be an exception to this general plan? In fact they are not; but their arrangements are very complex, and imperfectly understood.

I. We will first consider certain particulars of the formation of part of the corona radiata of Reil. You will notice especially the posterior cornu of the ventricle, which plays an important part in the topography.

The nucleus caudatus has been removed; its radiating appendage (that is to say, the cortico-striated radiating fibres) has also been removed (fig. 31, FK), so that the surface of the cortico-optic radiating fasciculi is laid open (F T, fig. 31). It is possible, then, in these last fasciculi, to distinguish three groups of fibres.

1. Those in front are called the anterior root of the thalamus, and pass to the frontal regions.

2. Those in the middle are called lateral expansions, or radiations.

3. Those behind, named by Gratiolet (who first described them), central optic expansions, or optic nerves.

The fasciculi last named, which we are now studying, are only separated from the cavity of the posterior cornu by the ependyma and the tapetum, an expansion from the splenium of the corpus callosum.

In this very region, but at a greater depth, are the central expansions of the fasciculus of centripetal fibres, whose lesion brings about sensory hemianæsthesia of brain origin.

Here is, then, well marked association by contiguity between these fasciculi and the optic expansions; and

this association would explain, anatomically, the frequent co-existence of hemianæsthesia and crossed amblyopia, if it were clearly shown that the fasciculi called optic expansions are really prolongations of the optic nerves.

FN Fibres of lenticular nucleus which go to the periphery. FK Fibres of caudate nucleus which go to the periphery. FT Fibres of optic thalamus which go to the periphery. FD Direct fibres.

II. To examine this last point, it is well to look around, and consider what is known about these grey nuclei—where the optic nerves take their first origin at the base of the brain—in a sense, outside the cerebrum proper. Some data about the external architecture of the parts we are considering must be given first.

Having detached the whole of the isthmus from the brain, and having left the thalami attached, we examine the posterior surface of the preparation thus obtained, and we find as follows :—

1. In front, on each side, are the thalami.

2. Behind, the anterior and posterior corpora quadrigemina.

3. On the outside, the anterior fasciculi, their inner ends in relation with the anterior of the corpora quadrigemina, and the posterior fasciculi in relation with the posterior corpora.

In the same region, on raising the posterior end of the thalami or "pulvinar," we see within, the inner corpus geniculatum, and outside, a little larger grey mass, which is the external corpus geniculatum.

Behind and above these parts is the fillet of Reil, the processus ad Testes, the cerebral peduncles, the restiform bodies, and the middle cerebellar peduncles.

The inner and outer geniculate bodies are clearly the two first grey nuclei, with which the optic nerves form relation in their course to the brain. We know that these nerves behind the chiasma take the name of optic tracts, or bands; and how these last in their posterior two-thirds are divided into two tracts, which may be considered as inner and outer roots.

The outer is the most voluminous and important; it gives off many fasciculi which are connected with diverse grey nuclei.

1. We may trace a band which ceases in the outer geniculate body. This consists of a considerable mass of grey substance, containing stellate or fusiform ganglion cells—of larger size—which are well represented in Henle's book.

2. A second band, placed inside the last-named, passes into the lower part of the thalamus, about twelve millimetres anterior to the extremity of the pulvinar. In a transverse section, such as is figured in Meynert's work, the band in question is placed between the outer geniculate body, and the foot of the peduncle. The existence of this band, as stated by Gratiolet, is also recognised by Meynert, Henle, and Huguenin.

3. A third band, which, according to Gratiolet, is the clearest and best known of the roots of the optic nerve, passes round the outer geniculate body and enters the anterior quadrigeminal body of its own side. Gratiolet's description, confirmed by Vulpian and Huguenin, is perfectly correct as far as most of the mammals are concerned. But in men and monkeys the band requires most careful examination before it can be made out.

From what has been said you see that the outer roots of the optic nerve arise in these grey nuclei, namely—

1. The thalamus.
2. The outer corpus geniculatum.
3. The anterior corpus quadrigeminum (nates).

These are certainly the chief roots of the nerve in man, and the only ones in a great number of animals. These are the conclusions which appear to result from M. Gudden's interesting experiments, consisting of extirpation of the eyeballs of young rabbits.

When at the end of some months the mutilated animals were killed, it was found that the result on the central parts was atrophy of the *anterior* quadrigeminal tubercles, of the thalami, and of the *outer* geniculate bodies. And on the other hand, the *posterior* quadrigeminal tubercles, and the inner geniculate bodies, were unaffected.

Although less important, we must not neglect the internal root of the optic nerves, especially when we are considering human anatomy. It is known that it is connected with the inner geniculate body. This latter containing only rudimentary nerve cells (Henle) cannot be regarded as so important a centre as the outer geniculate body. Whether it is after traversing the geniculate body, or in a straight course, the nerve bands of the inner root ultimately end in the anterior quadrigeminal tubercles. Quite recently Huguenin has shown that the inner root of the optic nerves, at any rate in man, is anatomically related to the posterior quadrigeminal tubercles, either directly or indirectly, through the inner geniculate body. According to that, the posterior quadrigeminal tubercles could not be entirely unconnected with the optic apparatus in man, as they appear to be in animals.

This does not conflict with the indications of certain symptoms of grey induration of the optic nerves. And quite recently, in an ataxic woman, blind for fifteen years, grey induration of the optic nerves could be traced from the chiasma along the tracts as far as the geniculate bodies.

The quadrigeminal tubercles—nates as well as testes—had nearly kept the white colour of health, but they had

both undergone a most manifest loss of size. I have also made many similar observations.

We must inquire how these various grey nuclei are connected with the grey cortical matter of the brain. The relation is effected, as I have hinted, by a system of fibres constituting the most posterior part of the radiating fibres of the thalamus, and which are sometimes named Gratiolet's optic radiations. You can follow the rather complex anatomical details on this point, in the following figure borrowed from Meynert's work (fig. 33) :—

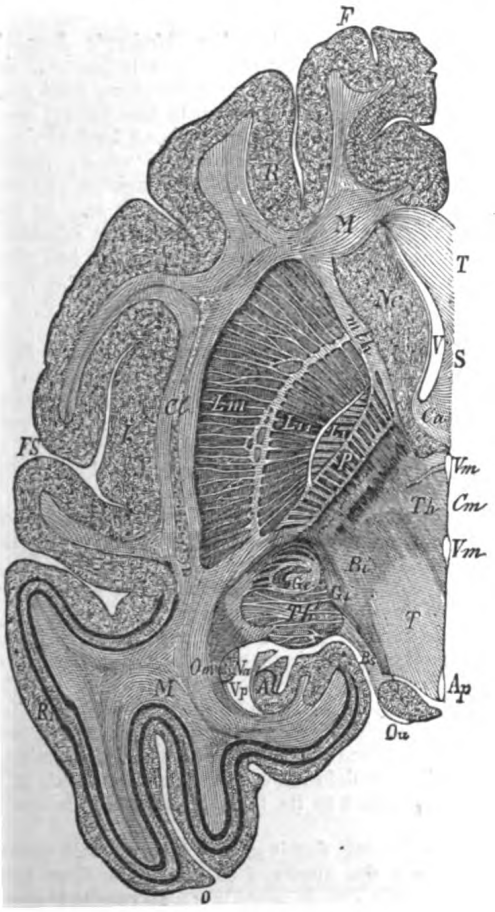

FIG. 33.

Na Head and Nc Tail of the caudate nucleus. Th Part of the optic thalamus situated in front of the corpora geniculata. Th' Optic thalamus, pulvinar. Qu Quadrigeminal tubercles. Gi Internal geniculate body. Ge External geniculate body. P Foot of the cerebral peduncle. Om Medullary fasciculi from the occipital lobe which go to the pulvinar, to the (BS) processes of the anterior quadrigeminal tubercles, to the (BI) processes of the posterior quadrigeminal tubercles, to the corpora geniculata, to the foot of the cerebral peduncle.

The section is a horizontal one of a monkey (*Cercocebus cinomolgus*).

It may be seen in that plate how the fibres radiating from the outer geniculate bodies, G E, and inner G I, from the pulvinar, TH', from the anterior quadrigeminal bodies, Q U (these last indirectly through the anterior band, B S) after running backwards, go to unite with the band, OM, which is the collection of centripetal fibres known as direct peduncular fibres already described, on which depends the common sensation of the whole of the other side of the body.

Doubtless with these bands are mingled the fibres coming from the olfactory tract through the anterior commissure, whose extremities, according to Burdach and Gratiolet, pass backwards into the substance of the occipital and sphenoidal lobes. Clinical facts lead us to suppose that there are also here decussating nerve fibres in relation with the auditory and gustatory nerves. If this arrangement, at present quite hypothetical, should prove to be anatomically correct, we could understand how crossed impairment of smell, taste and hearing, as well as of sight, habitually forms part of the syndrome, cerebral hemianæsthesia.

The cerebral region to which I call your attention, and which corresponds with the hindmost part of the foot of the corona radiata, might be regarded as a sort of cross-road in the substance of the brain, where all the sensitive and sensorial tracts meet in a limited space. It is a cross-road, not a centre ; the true cerebral *centre* must be sought in the cortical prolongation of the medullary fibres—in the grey matter of the occipital and sphenoidal lobes.

We shall have to return to this point when considering localisations in the cortex.

(To be continued.

ON THE PHYSIOLOGICAL ACTION OF THE BARK OF ERYTHROPHLEUM GUINENSE, GENERALLY CALLED CASCA, CASSA, OR SASSY BARK.

By T. LAUDER BRUNTON, M.D., F.R.S.; and WALTER PYE, Esq.

SEVERAL months ago we received from Mr. Monteiro a piece of casca bark, which he had obtained with great difficulty from a native at Bembe during his residence in Angola. This bark is used by the natives as an ordeal, persons suspected of theft, witchcraft, or other crimes being made to drink an infusion of it. If it causes vomiting only, the person is acquitted ; but if it causes purging he is considered to be guilty, and is either allowed to die of the poison or is at once killed. Among some tribes a practice prevails of making the accused, after drinking the infusion, walk in a stooping posture under half a dozen low arches made by bending switches and sticking both ends into the ground. Should he fall down in passing under any of the arches he is at once considered guilty, and, without waiting for a purgative effect to be produced, is at once put to death.

All the natives agree in their description of the effect produced on a person poisoned by this bark. His limbs are first affected and he loses all power over them, falls to the ground, and dies quickly, without much apparent suffering.

The same bark, or one having precisely similar effects, is used as an ordeal in Sierra Leone, under the name of "red-water bark," and in Ashantee under the name of "doom." In both these places the test of vomiting or purging only seems to be employed, and not that of stumbling, as described by Mr. Monteiro ; but according to C. A. Santos, the missionaries describe the bark as causing vomiting, glazing of the eyes, and loss of the power of contracting the muscles throughout the body ; so that, when the poison has fairly commenced its action, the sufferer is incapable of standing or walking, and the head rolls heavily about the breast and shoulders.

Appearance of the Bark.—The pieces given to us by M. Monteiro were from 8—12 inches long, about 4 inches broad, and ⅜ of an inch thick, dark brownish-red in colour, and deeply grooved externally. Their appearance agreed exactly with the description given by C. A. Santos, in the *American Journal of Pharmacy*, April, 1849, p. 96, of the bark which he terms Saucy bark, or Gidu.

Chemical Reactions.—When treated with alcohol it yields a dark brownish-red tincture, and boiling water gives an infusion of a similar colour, which deposits a pale brownish-red precipitate on cooling; but at the same time the supernatant fluid remains turbid from suspended particles, which do not subside, and which are not removed by filtration. It becomes clear when heated, but the turbidity returns on cooling. The tincture, when evaporated, leaves a resinous-looking extract, and when mixed with water gives a pale brownish-red precipitate. The watery solution of either the alcoholic or aqueous extract becomes much darker in colour after exposure to air.

An aqueous solution gives a brownish-black precipitate with ferric perchloride, indicating the presence of some form of tannin. It also gives a precipitate with tincture of galls or tannic acid, mercuric chloride, stannic chloride, gold chloride, silver nitrate, and lead acetate, either neutral or basic. If the precipitate produced by neutral lead acetate be removed by filtration, the addition of basic lead acetate to the filtrate causes very little further turbidity. Platinum chloride causes little or no precipitate.

These reactions closely agree with those given by Santos and Procter.

Santos states that by passing the dilute tincture through animal charcoal, washing, drying, and boiling in absolute alcohol, he obtained a crystalline substance which was poisonous; but Procter failed to obtain a poisonous substance, although he got crystals which were non-poisonous.

From the small quantity of bark at our disposal, we have not attempted to isolate any active principle, as we feared our supply would not be more than sufficient for the investigation of its physiological action.

Professor Liebreich, however, has lately succeeded in separating a crystalline substance which is exceedingly poisonous.

General Action—Its action on the lower animals has been investigated by Santos and Liebreich. The former found that a decoction of the bark caused alternate dilatation and concentration of the pupils, appearance of delirium, violent retching, vomiting, symptoms of tetanus, and finally death. The crystalline principle obtained from the bark by Liebreich caused vomiting and sudden death, without previous loss of consciousness. Death is attributed by him to paralysis of the heart.

In our own experiments on dogs and cats we have observed vomiting, weakness, and death during a convulsion from the effects of the drug, whether introduced into the stomach or injected under the skin, into the peritoneal cavity, or into the veins.

GENERAL ACTION ON MAMMALS.—ACTION ON CATS.

Experiment I.—*Effects of a very Large Dose.*—Four and a half cubic centimetres of a saturated alcoholic solution of casca (*a*) were injected into the abdominal cavity of a half-grown kitten weighing 746 grammes. At three minutes after the injection it began to walk stiffly, and a peculiar jerk occurred in the hind legs each time they were lifted. Respirations 60. At five minutes after injection it seemed giddy, and rolled over on trying to walk. Fæces were passed. Respirations 80, gasping. At ten minutes it was lying on its side with its mouth wide open; respirations 120. At ten minutes thirty seconds the respirations were 160. At eleven minutes it made feeble and unsuccessful attempts to vomit; the respiration became intermittent; there was an oscillating movement of the eyeballs, and the pupils were widely dilated. At twelve minutes the respiration became slower, as well as irregular. At sixteen minutes it was 60, irregular and laboured. At twenty-one minutes the respiration appeared to be entirely diaphragmatic. At twenty-four minutes there were strong, ineffectual attempts at vomiting, followed by sudden stoppage of respiration, and death in a condition of emprosthotonos. The pupils at that time were widely dilated.

On opening the thorax immediately after death, the ventricles were found firmly contracted; but they recommenced to pulsate, and continued to do so for a few minutes spontaneously. They responded by a single contraction to irritation for three hours and a half after death. By this time the heart looked quite dry and glazed, and *rigor mortis* was well marked in the muscles. The lungs were pale.

Experiment II.—*Effects of a Moderate Dose.*—Three cub. centims. of the same alcoholic solution were injected into the abdominal cavity of a cat weighing 2238 grammes. At twenty-five minutes afterwards the animal vomited; and this was repeated at thirty-five and forty-one minutes. At forty-one minutes the cat seemed weak; respirations laboured, 60 per minute; pulse 100, regular. At fifty-five minutes respirations 80, shallow, irregular. At seventy-five minutes respiration deeper and more laboured. At eighty-five minutes the gait was staggering, and the limbs were moved with a jerk at the end of each step; respirations 40, more regular; pulse 100, regular. Four hours after injection the animal was sleepy; when roused it walked feebly; there was no further vomiting. Its condition remained unaltered as long as it was observed; and it died between eight and twenty hours after the injection.

On *post-mortem* examination *rigor mortis* was well marked. The abdomen contained some yellow serum. The stomach contained no solid food, but about two ounces of a greyish turbid alkaline fluid.

Experiment III.—*April* 28—Seven cub. centims. of a similar solution to that used in Experiments I. and II. were injected beneath the skin of a moderate-sized, well-nourished cat. In fifteen minutes the animal vomited for the first time, and this vomiting was repeated four times within the next hour and twenty minutes. During the rest of the day it remained quiet, without further vomiting, and with no paralysis or disturbance of muscular movements. It appeared to be quite comfortable.

On the following day it remained sitting in one position, and refused its food and milk. There was no vomiting, and no urination or defæcation. When disturbed, it would immediately return to its former position in a mechanical manner.

On the following day it passed a very small quantity of fæces; it was not observed to urinate, and, as before, it neither ate nor drank anything. It vomited once, very slightly.

From this time forwards, for a fortnight after the administration of the poison, the cat remained in this condition, neither eating nor drinking, although tempted to do so with milk and meat; and even when a live mouse was placed before it it merely pricked up its ears and looked eagerly at it, but did not touch it, nor did it pass urine or fæces once for the last eleven days.

It sat always in one position unless disturbed, and though it got steadily weaker did not lose flesh in the way an animal starved would have done. The temperature on May 2nd was 38°C.

Five days after the poison was given a subcutaneous abscess formed over the right scapula and ribs. No other lesions were ascertained during life. The abscess did not form at the seat of puncture.

It died, apparently from exhaustion, fourteen days after the poison was administered.

POST-MORTEM EXAMINATION.

Rigor mortis well marked.

Subcutaneous tissue contained a fair amount of fat.

There was a large, sloughy, subcutaneous abscess in the situation mentioned above, and another localised collection of pus a little higher up in the skin of the neck. No other superficial abscesses were found.

The muscles were pale and rather dry. There was general

(*a*) This solution was prepared by extracting the bark with alcohol and evaporating to dryness. The solid extract thus obtained was dissolved in warm alcohol in such quantity that on cooling a deposit occurred. The solution was then filtered and the filtrate employed for experiments.

congestion throughout the body of the larger venous trunks, but apparently not of the smaller ones.

Abdomen.—The omentum contained rather a large quantity of fat.

The stomach was quite empty, pale and contracted.

The small intestine contained a small quantity of bile-stained mucus; it was otherwise empty.

The large intestine contained bile-stained mucus, and in its lower half a considerable quantity of fæces, also bile-stained. The mucous membrane appeared perfectly healthy.

The bladder contained only a few drops of high-coloured urine, but not contracted at all firmly. It had the appearance of a bladder which has been dried when inflated, and the air then let out.

The kidneys were pale, although the renal vein was much distended.

The vagina and uterus contained a large quantity of a greenish smeary fluid, which under the microscope was seen to be mucus-pus. The mucous membrane had here and there patches of injection on it (*vide infrà*); near the orifice of the vagina the secretion had quite the character of ordinary pus, but no abscess existed there.

The diaphragm was pale, flabby, and very transparent (*vide infrà*).

Thorax.—The lungs were congested, but otherwise natural.

The heart was very pale and flabby; all the cavities contained moderate quantities of blood.

MICROSCOPICAL EXAMINATION.

Kidneys: epithelium not degenerated.

Heart: muscle-fibres very granular; in many places hardly a trace of transverse striation could be seen.

Voluntary muscles (rectus abdominis) also granular (well marked, but not quite so much as the heart).

Bladder: muscular coat not degenerated.

Intestines: muscular coat not degenerated.

Remarks on Experiments I.—III.

Experiments I. to III. show the effects of the poison on cats when administered in three decreasing doses.

It will be seen that, during life, the most prominent symptoms of a rapidly poisonous dose were in their order of constancy:—1, vomiting; 2, respiratory difficulty; 3, abnormal muscular movements.

After death the condition of the heart and great vessels and of the lungs are most noteworthy.

Vomiting.—This was a constant symptom in all the cats we experimented on, unless they were placed under special circumstances. The vomit consisted, first, of whatever food might be contained in the stomach, and then of a white frothy mucus. On no occasion did it ever have the appearance of intestinal (fæcal) vomiting.

In Experiment I. no actual vomiting occurred. In this case the stomach was found to be empty of food after death; and the absence of the symptoms in this case was doubtless due to the rapid paralysis caused by the very large dose administered.

Respiratory Difficulty.—This is a constant symptom, except when very small doses are administered.

On reference to Experiment I. it will be seen that at one time the respirations rose to 160 per minute. This, however, was exceptional. From 40 to 60 respiratory movements per minute is probably the average rate after administration of a moderately poisonous dose.

Abnormal Muscular Movements.—These are of two kinds; thus, immediately after the administration of any dose, large or small, there is very generally produced a peculiar twitching of the muscles of the limbs, especially of the hind legs. This is especially seen when the animal is walking.

When large, rapidly poisonous doses are administered, symptoms of general muscular paralysis and loss of co-ordination are developed *pari passu* with the dyspnœa and frequency of the vomiting. The animal rolls and staggers as it walks; its head falls on the ground; and, finally, it falls over on its side and is unable to stand. Death always occurs a very few minutes after the development of these last phenomena.

Appearance of the Heart Post-mortem.—As a rule, *post-mortem* examination of the heart shows a moderately firm contraction of the ventricles, with a somewhat distended condition of the auricles. The ventricles, however, were never found to be completely emptied of blood, and on one or two occasions the heart was found to be moderately distended, the left ventricle containing well arterialised blood.

On several occasions, but here also with one or two exceptions, a remarkable vitality of the auricles was noticed (Experiment I.).

The *post-mortem* appearances of the heart and their physiological value will be noticed more particularly in the section which treats especially of the action of that organ.

The lungs were, in all cases in which they were noticed, found to be pale, except in Experiment III. (see Experiment XXXI.).

One of the most noteworthy phenomena is the action of a small dose upon a cat in causing an utter refusal to take either food or drink, and that, notwithstanding this total abstinence from nourishment, the animal should live such a long time, should show considerable muscular power (being able to jump from the floor upon a chair up to the day before its death), and should have still retained so much of its subcutaneous and omental fat. Another point to be noted is the occurrence of subcutaneous abscesses, none of which were near the point where the poison had been injected.

The long continuance of life and retention of strength seem to us to indicate that the processes of tissue change had been retarded by the poison; and the granular condition of the striated muscles appears to indicate a diminution especially in the processes of oxidation.

(*To be continued.*)

HYDROPATHY.

By E. MARLETT BODDY, F.R.C.S., F.S.S., Etc.

(*Continued from page 60.*)

We must now consider the hydropathic treatment of the various kinds of dropsy, for, as the name implies, it is an abnormal state of the human system consequent upon the collection of fluid in the tissues; therefore, we may think on a first glance that the ingestion of cold water would tend to increase the amount, and, if so, then such practice would be decidedly injurious, whether the dropsy depended either upon kidney disease, morbus cordis, or on a diseased liver.

As the kidneys are the organs which secrete the urine, they naturally, if diseased, perform their functions imperfectly, and dropsy is the result; therefore, on a superficial view, the hydropathic treatment of kidney-dropsy would appear anomalous and unsatisfactory, but I think that I shall be able to demonstrate that such a conclusion is altogether erroneous, owing to the perfect harmlessness of water.

Kidney-dropsy is very generally produced by alcoholism, or, in a few cases, is caused by a sudden chill, or from too early an exposure after scarlet-fever; but that with which we are more acquainted, and which we are more frequently called upon to treat, is the first, *i.e.*, alcoholic; hydropathy, if suitable to this form, is also suitable to the others, which generally pass off and leave the system entire if the patient is treated in time; but the alcoholic, when once it has attacked an individual, leaves apermanent and disastrous impression. As alcoholism is generally the originator of kidney-dropsy, and as those people who are suffering from that form of disease have never drank anything besides stimulants (which pernicious custom has perhaps continued for some time),

and as we may conclude with a degree of certainty that water has for some years never passed their lips unless it has been mixed with spirit in some form or other, and as we see that such habits have acted in a way so detrimental to their health, so we may with equal certainty be sure that its prohibition and cessation is as beneficial to their shattered constitutions as the previous habit was injurious, and we may advise them with perfect safety to resume the natural mode of quenching thirst, *i.e.*, drinking cold water in lieu of drinking spirits; a little stimulant is necessary at intervals in order to prevent the system getting too low; but I am decidedly of opinion that such patients, whether the dropsy be far advanced or not, may drink cold water with impunity.

The kidneys no doubt have been, and are, overworked, but cold water will not by any means augment their duties, for a fluid which is a natural production, when pure, can no more be detrimental to a diseased kidney than its application to an inflamed joint or raw surface; therefore, I say, let the patient drink as much water as he pleases; it is far better than ordering him spirits and water, which practice is so much in vogue at the present day. Water will decidedly decrease the work of the kidneys, and will certainly not contribute towards an increase of albumen, and will, as I have previously asserted, tend to wash away any impurities which may collect in the urinary passages. The great difficulty, however, standing in the way of this practice is the strong aversion which this class of patients (who have accustomed themselves to spirituous and malt liquors) have to water, for they will persist in averring that stimulants are necessary and that water does them harm; this fact alone shows what a remarkable power drink possesses, when once a person is addicted to it, and when completely under its baneful influence. It also shows the insidious and subtle destructiveness of alcoholic stimulants, for the kidneys may be affected by what we may call private dram-drinking (almost a universal custom), as by excessive drinking, the only difference being the length of time which these two modes of alcoholic poisoning take to undermine the system.

Lord Bacon, in his essay "Of Regimen of Health," makes the following philosophical remarks, which this class of people would do well to study and observe as regards their mode and habit of living, and particularly those who have an unnatural and unwholesome craving for drink of a stimulating nature:—

"There is a wisdom in this beyond the rules of physic: a man's own observation, what he finds good of, and what he finds hurt of, is the best physic to preserve health; but it is a safer conclusion to say, 'This agreeth not well with me, therefore I will not continue it,' than this, 'I find no offence of this, therefore, I may use it;' for strength of nature in youth passeth over many excesses which are owing a man till his age."

As we have already noticed the advantages derivable from hydropathy in morbis cordis, and how it relieves the action of the heart, whether the disease be idiopathic or symptomatic, we must now consider the effect it has upon those people who are suffering from a congested state of the liver, or when that viscus is organically diseased. It is as equally beneficial as it is in other derangements of the system, and more so when the individual has disorganised his liver by frequent potations of alcohol and a too free mode of living.

There are very few people at the present day whose livers are what one would consider healthy, and especially in men and women above the age of forty; and all those who are of unwieldly bulk have a congested or diseased liver, which condition is promoted by not exactly intemperate habits, but by too frequent a use of strong stimulants and indulgence at table. To live cautiously and temperately, to gradually decrease the usual quota of stimulants, to drink water instead, and by all means to avoid drinks erroneously supposed to produce appetite, will do much towards improving the functions of an organ which secretes the natural purgative, for we know that when they are arrested constipation is the natural result, and we get an over-loaded state of the transverse colon with its accompanying pain in the back. A little weak brandy-and-water, or sherry-and-water, taken now and then, and at meal-time, is necessary; for these people are far from being healthy on account of their excessive over-living and obesity.

Alcohol is beneficial when necessary, but a poison of a most destructive nature when it is not, and the human organism is like a piece of machinery. What does an engineer do when his steam-engine is a little out of gear? He very carefully pours in a drop of oil here and there, and very soon he has the satisfaction of seeing it work as easily and smoothly as before; he does not treat his engine as a short-sighted human being treats his own wonderfully-made frame; he does not throw his oil hither and thither, careless of where it goes, indifferent as to whether his engine requires it or not, otherwise he would soon see the work of destruction around him, and he himself, perhaps, in a few moments, would be a disfigured corpse. This similitude shows, as I think, in what light we should regard alcoholic stimulants—that they are a blessing when properly used, but a curse when they are misapplied; and, besides, we may be sure that "intemperance is the great and original cause that generally shortens human life."

Those morbid conditions of the blood, such as pyæmia, septicæmia, leucocythæmia, and hyperæmia, and a variety of others only known to the skilled pathologist and histologist, and which are seldom met with, save in the post-mortem theatre of a hospital, would no doubt be modified by hydropathic treatment, unless there were some disorganisation going on in the spleen; all methods of treatment, then, would be entirely useless, for when any internal organ is thoroughly diseased, the case is hopeless and beyond cure; and this is invariably so as regards the spleen, for when this viscus is once involved, and extensively, death is not far off; the great exception to this rule is that condition of the spleen arising from ague, which enlargement is called the "ague-cake."

(*To be continued.*)

Special Reports.

POISONOUS TRADES AND MANUFACTURES.

ABSTRACT OF A REPORT ON THE MEANS OF DIMINISHING THE DANGERS RESULTING FROM THE EMPLOYMENT OF POISONOUS MINERAL SUBSTANCES, AS MERCURY, LEAD, ARSENIC, &c., IN CERTAIN TRADES, WITH THE EXPERIMENTS TRIED TO REPLACE THEM DEFINITELY BY HARMLESS AGENTS.

Made in the name of a Commission composed of

MM. Bernard, Lavergne, Burcker, Carnot, Gubler, Hillairet, Laborde, Napias.

By MM. GUBLER and NAPIAS. (*a*)

(*Continued from page 62.*)

General Hygiene of Mills, Workshops, etc.—Leaving individuals, we must next consider general measures applicable to ateliers, fabriques, &c. The substitution of machine for hand work in certain trades has powerfully assisted sanitation, but we must allude to some general questions affecting our mills and workrooms.

A. *The ventilation* of workrooms is of the utmost importance, and one problem of difficulty presents itself, in what proportion should the air be renewed?

The problem is difficult of solution on account of the number of factors we must take into account, but we may affirm as a general rule that ventilation must be energetic in proportion to the number of workmen employed in a given space, and to the materials employed, as regards their

(*a*) Subject of a paper to be submitted at the Congrès International d'Hygiene de Paris during the sittings from the 1st to the 10th August. This Report, extending to 37 pages 8vo, is of the greatest practical importance, and we trust our English sanitarians will well consider it before attending the Congress.

poisonous nature, texture, &c. Ventilation may be obtained either naturally or artificially. For natural ventilation the windows may be utilised by having them on different levels.

By thus availing himself of some well-known natural laws, Mr. Watson, of Halifax, Yorkshire, has designed an ingenious arrangement which may be applied to all kinds of buildings, and which is well known under the name of "Watson's syphon self-acting ventilator." M. de Freycinet has described it in his "Traité d'Assainissement Industriel."

Watson's method of ventilation is founded on the discovery that in a tube divided longitudinally a double current of air is established, the heated air passing out by one of the openings, and fresh air entering by the other; and thus, briefly described, the apparatus consists of a divided tube or turret, placed generally on the roof, and forming a communication between the ceiling of the apartment to be ventilated and the external atmosphere.

This ingenious and effective system may be modified and adapted according to circumstances and the construction of the building, requiring ventilation.

The present manufacturers and proprietors of the "Watson syphon ventilator," Hill and Hey, of Halifax, after twenty-five years' experience in its construction, have produced some valuable improvements in it, and have also patented a new and efficient ventilator designated the "Excelsior syphon," in which there is no mechanical motion, no down current, and no admission of wet or dust.

From the numerous favourable testimonials from practical and experienced architects in favour of the "Excelsior," it seems as if it were likely to supersede the older form. There are some great advantages in such a natural system of ventilation, viz., that its action is the same in the absence of, as well as when there is, wind; that there are no dangerous or perceptible draughts; and that there is an exchange of good air in all seasons and in any quantity.

There are some other systems of natural ventilation which may be useful in certain cases. Necessity may require for certain workrooms artificial ventilation which may be obtained by three distinct methods.

1. By utilising the apparatus for heating.
2. By establishing a communication between the atelier and an external fire and chimney.
3. Mechanical ventilation, of which there are a great number of kinds.

B. Closed Apparatus.—When vapours are noxious and injurious, the workman may be protected by such apparati as that described by Dr. du Mesnil, in the fabrication of verre mousseline. Mr. Higgins, a workman, has rendered great service to hygiene, and consequently to humanity, by the invention of an "appareil clos" for steeping matches; it is in use at Stratford, near London, where nearly six million matches are yearly made. M. Deschamps, another workman, has designed an apparatus with a similar object of protecting caoutchouc operatives.

C. Neutralisation of Vapours.—In certain industries some vapours may be neutralised, as for instance by essence of terebenthene, on the theory proposed by Dr. Letheby of London. It prevents the slow combustion of phosphorus and the consequent formation of acid vapours. At Saint Gobain ammonia has been employed to neutralise mercurial vapours.

The plan is very simple, consisting of pouring on the floor of the workrooms some liquid ammonia of commerce. These few examples are perhaps sufficient for the development of our programme. The members of the Congress will be able to tell us of new triumphs, and other means of rendering our workrooms and mills sweeter and healthier, will no doubt be communicated in the course of our discussion.

III.—Substitution of Harmless for Poisonous Agents.

All our precautionary measures to preserve the health of the workman must have one aim—viz., to substitute inoffensive for poisonous substances. All hygienists are agreed on this point.

Humanity in general is benefited by general hygiene; by our special provisions for trades and occupations of all kinds the individual gains. We cannot here point out all the attempts made with this object, but we shall select a few examples to encourage investigation and develop our programme.

A. Attempts to suppress Mercury.—We know how many industries are tributaries to mercury. Hatters are very much exposed to the injurious influence of this metal. The operation giving rise to the dangers is known by the name of *Secretage*, as the makers who first used the mercurial solution kept it secret. The solution is made of mercury, nitric acid, and water, in variable proportions for the *secret jaune* and *secret blanc*. It is spread on the skins by means of a brush, and when the skins are dried they are then shorn by the hand or by machinery, the latter diminishing the risks of poisoning. Dr. Hillairet has endeavoured to replace the mercury by treacle. He has related his attempts in a note communicated to the Academy of Medicine, upon which Dr. Delpech has reported.

His method is as yet imperfect, though it has yielded good results. It requires more manual work—compensated, may be, by the difference in price between the solution and the molasses, and by the possible lowering of wages, as the artisans can thus work without danger. Dr. Hillairet calculates 10,000 workmen in France and 23,000 in Europe would be thus removed from the dangers of mercurial poisoning.

Looking-glass makers are also exposed to mercurial intoxication. M. Brossete, Paris, has made happy attempts to dispense with this agent. Surfaces may be silvered by a solution of ammoniacal nitrate of silver and tartaric acid. The method has been perfected, and should be popularised.

The employment of mercury in gilding has very much diminished. There are four different methods.

Gilding with mercury. Gilding *au trempé*. Gilding on wood, and Galvanic gilding. The third method exposes the workman to the dangers of lead-poisoning, as the varnish is composed of white lead and litharge.

Gilding, *au trempé* exposes to nitrous fumes. Gilding with mercury is still more dangerous.

Galvanic gilding should replace all the methods.

B. Substitute of red for white Phosphorus.—This industry will never be truly healthy until this change is made and maintained by law.

Denmark has led the way; the law of 14th February, 1874, interdicts the use of white phosphorus.

C. Attempts to suppress Lead.—All enamels contain lead—40 to 60 per cent. of oxide of lead. M. Constantin, pharmacien, Brest, has obtained an enamel in every way inoffensive by substituting chalk for the oxide of lead, and peroxide of manganese for the minium.

M. de Freycenet praises another enamel used by M. Delloye, Masson, de Bruxelles.

The definite substitution of white zinc for white lead in painting is another desirable step. M. Leclaire, an employer, has obtained as good results with it, and thanks to his exertions, the use of *cerise* has diminished. Custom and routine oppose progress. We may also mention the method of engraving glass by electricity, devised by M. Plante, as it also dispenses with the use of lead.

D. Attempts to suppress Tonic Mineral Substances and particularly Arsenic in Colouring Materials.—The injury, arising from having arsenic in colours, has long been a subject of thought amongst chemists; they have made greens without arsenic, as *vert milory, vert de prusse, vert de chrome, l'ontremer vert*, but though the painter thus benefits, the makers of these colours are exposed to other dangers.

The ideal for an inoffensive colour is to to obtain it from the vegetable world. For greens we have *vert d'herbes, le vert de vessie*. MM. Collineau and Savigny have recently exhibited to the Society of Public Medicine, some curious patterns, obtained from the vegetable colours.

M. Turpin has made some successful attempts with toys in caoutchouc, by a method capable of many other applications. He will exhibit his preparations before the members of the Congress. It would be easy to multiply instances of the substitution of inoffensive substances for toxic mineral agents, as the substitution by photographers of the hyposulphite of soda for cyanide of potassium, the vulcanisation of caoutchouc by the American process, but the limits of this report do not allow any further development.

In conformity with the desire of the committee and our instructions, we have avoided pronouncing on the value of the different methods we have enumerated, reserving our opinions for the subsequent discussion. We have only desired to develop the programme, of the question of professional hygiene submitted to the Congress, and to elicit from the members new methods and ideas for the preservation of the workmen in our various industries, from the dangers resulting from the employment of poisonous minerals.

Clinical Records.

MERCER'S HOSPITAL, DUBLIN.

Under the care of Mr. E. S. O'GRADY.

AMONGST the patients in this service whose cases came to a conclusion during the months of May and June were the following:—

Amputation of Ankle [Syme].—The patient, a groom, æt. 44, had long suffered from disease of the right foot; for this the calcis had been in great part excised in another hospital. Extensive incisions traversed the locality of the heel, and it was feared these would interfere with the vascular supply of the flap, which, however, preserved its vitality well, and the case progressed satisfactorily, the resulting stump being all that could be desired.

Severe Injury of Hand from Gunpowder Explosion.—A woman, æt. 22, engaged making cartridges of heavy type, exploded one whilst it was grasped in the hand. The left thumb was blown clear off, disarticulation being effected through the carpo-metacarpal joint. The hand was otherwise extensively and badly lacerated on both palmar and posterior aspects. The treatment consisted in a little paring of the soft parts where specially indicated, with dressings affording gentle support. Limited sloughing occurred, the dead portions were rapidly cast off, after which the extensive wound healed in quickly, the appearance of the resulting hand being remarkably free from deformity. Unimpaired use of the fingers remained.

Excision of the first Metatarsal Bone.—The left foot of a farmer, æt. 22, had become the seat of much disease, consequent on a cow treading on it long previously. The parts were much swollen and deformed, numerous sinuses leading down to dead bone. The metatarsal bone, as well as an irregular and large mass of new structure surrounding it, were necrosed, together with part of the first phalanx of the great toe, thus necessitating the removal of these parts. At the operation it was ascertained that the metatarsal bone had been broken at the time of the accident; its much displaced fragments were surrounded by the extensive diseased involucrum referred to; the local repair was all that could be desired, but the patient developed rapidly advancing phthisis, which, when he left the hospital, with the foot wound nearly healed, seemed likely to run its course quickly. He was further troubled with a large "cold abscess" in neighbourhood of left hip. This burst before his departure.

Gonorrhœa in an Infant.—The affection was typical and accompanied with severe inflammatory phymosis. The age of the child was twenty-six months. No direct history could be obtained from the parents, but enough was otherwise ascertained to confirm the diagnosis. The maladies yielded rapidly to simple treatment.

Operation of Hare-lip in an Infant of Thirty Days Old.—The malformation was single on the right side, and complicated with protruding bone; this, after partial division above, was forced back and retained *in situ* by inter-osseous sutures. Two hare-lip pins effectually supported the soft parts when trimmed. The progress and result of case was eminently satisfactory.

Excision of Elbow was required for necrosis in a delicate girl, æt. 19. The single long dorsal incision was selected. The case did well, the patient leaving the hospital in about six weeks after the operation, a couple of small sinuses still being unhealed, but the general health was vastly improved and there was excellent power and capability of motion in the limb. Subsequent reports were confirmatory of her progressive recovery.

Exceptionally Large "Housemaid's Knee" occurred in a woman, æt. 34. In size the growth fully equalled a large cocoa-nut, the circumference of it and of the limb being *twenty-four inches*. Over the central portion was a patch of indurated and diseased integument, through which the sac was advancing to rupture. Two elliptical incisions included the portion of skin alluded to, and enabled the contents of the growth to be got rid of; these were a quantity of boiled sago-like material, partly adherent around the parietes, but mainly suspended in a dark fluid; the large cavity healed in kindly, the woman being able to leave the hospital in a few weeks.

Ovariotomy.—The patient, a single woman, æt. 40, had had general dropsy on two occasions. This was at the time, she said, considered to have been of renal origin. The secretion of these organs when she first came under observation at Mercer's was scant and high-coloured, but with treatment became abundant, and at repeated examinations was found healthy. A somewhat atheromatous state of the blood-vessels existed, but otherwise the patient appeared to be in fair condition. The operation was done a week after the catamenial period. Only two small and unimportant omental adhesions existed. The wound, however, had to be a somewhat lengthened one to afford passage to a bulky portion, which was of very firm consistence, of the growth. A long and moderately slender pedicle was easily "clamped." At first, progress appeared to be satisfactory, but on the third day this changed, the patient became restless, her facial aspect bad, the temperature rose rapidly, and delirium finally supervened. The patient responded in no way to treatment, and she soon ran down, death occurring on the fourth day. There had been no sickness of stomach, nor could the presence of any fluid in the peritoneum be ascertained. Only an examination of the abdomen was obtainable. It was found that scarcely any effort at repair had occurred; there was but little attempt at adhesion of the opposed peritoneal surfaces, or of the wound. No peritonitis. Scarcely an ounce of normal-looking fluid was present. The kidneys and all the viscera were healthy, except the remaining ovary, which showed indications of commencing disease.

Enlarged Bursa communicating with Knee-joint treated by Incision.—This interesting case occurred in a lad, æt. 18. The character of the fluctuation indicated that a considerable articular effusion and the bursal fluid were in free communication. The bursal trouble was extensive, covering the whole external surface of the region of the knee, and passing it above and below. When the lad had been a short time in the hospital the skin became on the point of giving way, and consent was now obtained to open the collection, which was done freely by a long incision. This had the effect of discharging the effusion which existed in the knee, as well as the bursal accumulation. No constitutional disturbance followed. The limb was kept at rest on a suitable splint; healthy action and repair were soon set up, the patient being able, in a month, to go to the country with the wound healing healthily and nearly closed. The support of a light posterior splint was still continued. Improvement remained progressive, and when the case was subsequently seen there seemed every prospect of recovery with an ultimately unimpaired limb.

Removal of Breast was done on a stout, florid-faced, unmarried woman, æt. 43, who stated her health was good, and that the catamenia had ceased two years since. Both breasts were of large size, the affected (right) one being as large as a cocoa-nut. She had noticed it enlarging for about a year. A tail from the main growth ran into the axillary region, and slight adhesion to the pectoral was recognised. A couple of cysts could be felt beneath the integument, which was much thinned over them. The woman urgently desired to have her chance of benefit from removal. A modified mode of operation, consisting of two elliptical incisions above, meeting a semi-circular one below, enabled the mass and thinned integument to be removed with the least loss of substance; the wound came nicely together without any traction. A little sloughing of the edge of the skin occurred above; after this the case did well, the woman leaving the hospital five weeks subsequent to the operation, the parts having been for some days healed.

Medico-Parliamentary.

HOUSE OF LORDS.—July 22.

WEIGHTS AND MEASURES BILL.

Lord Henniker, in moving the second reading of this Bill, said that it was one of consolidation. It consolidated into one Act a number of enactments which had been found to be obscure in some instances and contradictory in others. The Bill, after being introduced into the House of Commons, had been referred to a Select Committee, which had carefully considered it, and he ventured to say the Bill was in a very perfect state. The Board of Trade had had the advantage of the valuable information procured by the Standards Commission of 1870, and it was worthy of notice that they had been fortunate enough to secure in the counsel who drew the Bill a gentleman who thoroughly understood the subject, not only legally, but scientifically. He thought he might fairly say that it was doubtful whether at any time the subject could have been dealt with mroe satisfactorily than at present. The Bill gave a more scientific definition of the various standards, it provided for the better care of official and local standards, and it laid down strictly and clearly the one principle that only certain standards should be used in trade. Athough it was a consolidating measure, the Bill did not interfere with the old jurisdiction, beyond securing a proper performance of its duties. As to the metric system, it recognised it practically, without making it part of the Imperial system. He thought that those who advocated that system should be content with this. If it were found to work well, their case for its general adoption would be the stronger. He thought the Bill went far enough in this direction for the present. The main object of all legislation on this subject was the maintenance of just dealing between buyers and sellers, while giving to science whatever assistance it might require. This, he thought, was secured by the Bill as far as possible, without unnecessary disturbance of existing customs, and without undue interference with local authorities. He believed it not only placed the law, but also the whole practical system of standards, on a more satisfactory footing.

Lord Colchester urged that the metric system should be put upon a level with the existing system of weights and measures.

Earl Fortescue thought the metric system had rather retrograded than advanced in public favour during the last few years, although other countries in succession, and particularly Germany, had adopted it very successfully. It was a matter of great regret that while the previous Act, rendering permissive the metric system of weights and measures, was embodied in the present Bill, yet practically the metric system of weights and measures could, under that Act, only be verified for scientific purposes, and not for purposes of trade. However, he hailed this Bill as being, on the whole, a valuable one, and would do nothing to delay its passing into law.

The Bill was then read a second time.

HOUSE OF COMMONS.—July 25.

SMALL-POX.

Dr. Cameron asked the President of the Local Government Board whether his attention had been called to the statement that a man named Carter, since dead of small-pox, was allowed, while prostrated by that disease, to lie from half-past seven in the morning till five in the afternoon of the 11th July in the public highway near Hadham Cross, Herts; whether it was a fact, as stated by Mr. Garrett, that a number of children were allowed to congregate round the patient; and whether he would order an investigation to be instituted into the case, and meanwhile direct that the children and others exposed to infection should be placed under observation, and steps taken, as far as possible, to prevent the spread of the disease.

Mr. Sclater-Booth said he had made inquiries respecting this case, and had received from the sanitary authority a report stating that Carter applied to the medical officer on account of some common ailment, the medical officer saw him, and said he had no reason to suppose that anything else was the matter with him. On the following day the man fell down by the side of the road, and remained there for a long time until a vehicle could be procured for his removal to the workhouse, which was five miles distant. The delay arose from the people in the neighbourhood refusing to lend a vehicle for his removal. The officers acted with promptitude and took means to prevent infection. As to the statement that children gathered round the man, it was not known who they were or whence they came. Under the circumstances he did not think it necessary to make any further investigation.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 31, 1878.

THE METROPOLITAN HOSPITAL SUNDAY FUND.

The Hospital Sunday Fund has now reached the sum of £24,500 and upwards, and we are told by the Secretary that there are many more amounts yet to come in, and therefore it is pretty confidently expected that, notwithstanding the unfavourable circumstances attending this year's collection, it will not fall short of that of previous years. During the week just past, however, a morning contemporary, in a leading article of some ability, has thought proper to review the past progress of the movement, and forecast its future. The writer considers that there is an evident lack of public interest in the work, as evinced by the falling off in the amount collected up to the present time. Now we not only dissent from the view taken, but must say we see no cause whatever for looking despondingly on the movement, we have every reason to believe that the result of this Hospital Sunday will favourably contrast with that of its predecessors. At all events when everything is fairly considered there is scarcely room for gloomy forebodings, neither is it just to make invidious comparisons between the Metropolitan Fund and those of the large provincial

towns where the movement has taken deep root, and a better organisation exists for securing the objects in view. In the large commercial centres of industry, as Manchester, Liverpool, Birmingham, &c., the Hospital Sunday is managed by the leading men of those towns, who band themselves into a committee, and who, knowing the exact wants of their several hospitals and dispensaries, aim at making the collection large enough to meet all demands. The clergy and congregations of the several places of worship go in heartily to assist in the work, and the Hospital Sunday Collection is thus made the principal event of the year. In London this is not quite so, and metropolitan congregations are more frequently appealed to to help in other works of charity. We are quite within the mark when we say that at many of the principal churches there are scarcely two consecutive Sundays in the year without an appeal for this or that asylum, orphanage, or local charity.

Our contemporary fairly and properly assigns other very good reasons for a complete success in London, as, that want of harmony and unity of action, the difficulty of penetrating a vast body wanting in a community of emotion for the cause of hospital charity, and also of that local interest which induces the inhabitants of provincial towns to vie with each other in rivalry to place their institutions beyond the pinchings of poverty. Medical charities are also fewer in proportion in the provinces, and their individual wants are better known. It is quite probable, too, that they are, as is asserted, better managed. In London it is said that a want of interest in the hospitals has arisen from a wide-spread impression "that they are not so economically managed as they should be; that the hospital system has several abuses connected with it," and which managing committees are unwilling to look into with a view of bringing about a reform. There are very substantial grounds for stating that in the course of the year a third at least of those who partake of hospital charity can well afford to pay for the medical advice and medicine they receive. But this must be looked upon simply as an admission of the fact that the Metropolitan Hospital Sunday Fund has not yet solved the difficult question of the distribution of medical relief in London. The answer to this charge is that it was not the object for which the Fund was founded. If, however, it has not succeeded in this respect, it has been the means of calling into existence another movement as a counterbalance to the evil. The Hospital Saturday Fund, a sister Fund, has afforded an opportunity to those who participate in the advantages of medical charity to contribute to the fullest extent towards their support, if they will.

The Metropolitan Hospital Sunday Fund has, however, from its commencement had to contend with enemies from within and without. It has been exposed to the craze of a set of people banded together under the name of "Anti-Vivisectionists," and who malign and abuse everyone and everything connected with hospitals; in fact do all in their power to injure the Hospital Sunday Fund. These people are too blind and perverse to see that by withholding help from hospitals, they can in no way influence those engaged in the great work of medical education, and in their obstinate course they violate those Divine laws in the belief of which they boast so much. Their demand is worse than ridiculous, that the Council of the Metropolitan Hospital Sunday Fund shall dictate to a body of educated men as to how they shall become skilled in the art of healing the sick. With regard to those who seek to injure the cause in another way, they profess to see that the work of the Distribution Committee of the Fund is out of joint with the times. One particular clergyman, a Mr. Haweis, described by a medical contemporary as a "popular and powerful member of the metropolitan clergy," it appears, preached for the Fund, and immediately diverted his collection into another channel, a questionable mode of proceeding, to say the least. His reason for taking so unusual a course is stated to be that he has some objection to the rule that guides the Committee of Distribution. The consideration of the "merits and pecuniary needs" of hospitals he particularly objects to, and this quibble he raises that he may hand over the money collected to a special hospital in which he is particularly interested, and which unfortunately, and for very good reasons, was excluded from all participation in last year's fund. It would be quite impossible to devise any principle of distribution which should meet the objections which such people might raise.

Putting such questions aside, there is a more reasonable cause for any falling off in the Fund that may occur this year; a cause which has more or less affected all London charities. We refer to the great depression of trade, and the serious diminution of incomes derived from special services, and which have been greatly affected by the war. We may incidentally remark, that with regard to trade, we learn from competent sources, although failures were unusually numerous last year, that during the first six months of the present year, 1878, they have been as numerous as during the whole previous year, 1877. The rapid wasting away of resources, which so much increases the number of bankruptcies, implies a generally disordered state of trade and credit, and we naturally look for a corresponding inability on the part of the benevolently disposed to assist in any work of a charitable nature. But when it is said that there has not been an actual increase in the amount collected for the Hospital Sunday Fund, it must, at the same time, be taken into account, that it has brought into existence, and been supplemented by, a Hospital Saturday Fund; and it will not be denied that the two funds together have been an immense boon to hospitals and dispensaries. With regard to the work of the Metropolitan Hospital Sunday Fund, it is far too noble and elevating to fear the assault of enemies, and we predict that it will endure long in spite of them.

THE QUEEN'S COLLEGE, GALWAY.

THE first Report of the new President of the College, Dr. Moffett, has been presented to Parliament, and we have to congratulate the learned doctor on being able to submit the most flourishing account of the institution (at least in respect of number of its students), which it has ever fallen to the lot of its President to put forward. In the Session 1876-7, 85 new students entered, and 174 were in attendance on lectures, against 91 and 167 respectively for the Session 1875-6.

The distribution of religious denominations amongst these students affords an interesting comparison of the present epoch with that of twenty years ago.

A comparative number of students per year attending lectures in Queen's College, Galway, twenty years ago (taken on averages of five years) and now :—

	5 yrs. 1856-61.	5 yrs. 1872-77	Increase or Decrease.
Church of Ireland ...	32·4 ...	30·9 ...	dec. 4·6 p. c.
Roman Catholics ...	63·0 ...	77·4 ...	inc. 22·9 ,,
Presbyterians ...	14·2 ...	43·2 ...	inc. 204·3 ,,
Total Students ...	116·0 ...	158·6 ...	inc. 36·75 ,,

From these figures it appears that in the twenty years the College has increased its number of students by 36·75 per cent. ; but the members of the Church of Ireland were fewer in number than twenty years since—the Roman Catholic students have increased in number only 22·9 p. cent., while the Presbyterians have flocked to the College in such numbers as more than to treble the number of students of that persuasion. In fact, of the total increase of students in the twenty years (42·6), three-fourths (29·0) are due to the influx of Presbyterians.

The following return of the number of students in each faculty for the Session 1876-7 is especially interesting :—

Faculty of Arts - - -	54
Law - - - - -	4
Medicine - - - -	107
Engineering - - - -	10
Occasional Students - - -	6
	181
Deduct attending in two Faculties	7
Total individual Students - -	174

This return teaches us, *firstly*, that not much more than one in three of the Galway students undergoes full study in Arts ; *secondly*, that nearly two-thirds of the whole number are students in Medicine ; *thirdly*, that hardly a single one of these medical students (who are destined some day to be enrolled as University Doctors of Medicine) receives any liberal Arts education.

These facts make it sufficiently evident that, if the day ever comes when the M.D. of the Queen's University ceases to be attractive to the students ; when it ceases to be cheaper and easier than the Doctorate of other universities ; when a Degree in Arts is made an essential requirement for the Doctorate in Medicine—on that day the Queen's College, Galway, will cease to exist, for it is obvious that it cannot live upon 54 students in arts, 4 in law, and 10 in engineering.

In the session to which the Report refers, out of the 107 medical students, only seven obtained the M.D., and six of whom took also the M.Ch., and one obtained second-class honours.

The President, however, appears to consider this outcome of the year's medical teaching highly creditable to the College, for he says :—

I feel bound to express my satisfaction at the success of the medical school of the College. During this session 107 students attended lectures in the Faculty of Medicine, being the largest number since the foundation of the College. Since the close of the session the medical school sustained a serious loss in the resignation of Dr. Cleland, consequent on his appointment to the Professorship of Anatomy in the University of Glasgow. Dr. Cleland for fourteen years occupied the chair of Anatomy and Physiology in this College ; and his eminence as a man of science, and his indefatigable labours as a teacher, contributed largely to the progress and character of the school. He has been succeeded by Dr. Pye, who for some years ably filled the chair of Materia Medica ; and the experience of the present session (1877-8) gives promise that the reputation of the school will suffer no decline. The number of students in attendance on lectures at present amounts to 113.

The remarkable progress of the medical school is sometimes made a ground for disputing the success of the College ; it is dogmatically asserted that universities ought not to be places for professional instruction, and that, however numerous students for professions may be, the success of colleges should not be measured by them, but only by such students as pass through the curriculum of the Faculty of Arts. Many students cannot afford to spend their time up to twenty-one or twenty-two years of age in the study for a preparatory degree which is to be the mere foundation-stone of their professional edifice, and I believe it will be generally found that, owing to the constant demand for the services of medical men and the comparative certainty of immediate employment which the profession holds out, students of medicine far out-number students in arts in colleges circumstanced as the Qeeen's Colleges are. It was the original function of universities—never, I trust, to become antiquated—to act as the instructors of all who have occasion for learning, and not merely of the wealthier classes of the community ; and universities must adjust their arrangements to the changed requirements of society, else they will see the modern stream of thought and action flow swiftly past them. It is the power of liberalising the professions that distinguishes universities from technical schools ; and one of the objects with which the Queen's University and Colleges were established was to extend to professional students the status and advantages of a university degree. These bodies fully recognise the principle that liberal culture ought to be the foundation of all the professions, and have constantly endeavoured, so far as has been practicable, to give effect to that principle.

If the President's assertion be true, that it was "one of the objects with which the Queen's University and Colleges were established was to extend to professional students the status and advantages of a University degree," we find it difficult to understand how it has carried out this programme ; nor can we appreciate the value of such a University as an agent for "liberalising the profession," if it only does so by the cheapening and lowering of degrees which elsewhere carry with them "the status and advantages of a University degree." We beg to be informed what it is that the Queen's College, Galway, does for a student ? what "status" does it confer upon him ? what "advantages" does it give him ? other than those placed at his disposal by any ordinary private medical school. The University truly attempts to confer such "status" by dubbing him M.D., though it does not give him the Arts education, which is the price of status ; but as long as M.D. signifies nothing more than ordinary medical instruction, it carries with it no more prestige than does the license of any diploma-giving body in the market.

"Universities must adjust their arrangements to the changed requirements of society," says the President, "because students cannot afford to spend their time up to twenty-one years of age in the study for a preparatory degree which is to be the mere foundation stone of the professional edifice." In other words, the Queen's University must grant degrees simply to suit the demand, and to fit the knuckle of its constituents, and it therefore confers the full Doctorate in Medicine to those who "cannot afford to spend their time" as boys, in the preliminary schooling which is necessary for them as "the foundation stone of the professional edifice."

SPELLING REFORM.

On the last occasion on which we noticed this subject we were unable from want of space to consider what might be said, either in favour of or against the different spelling reforms that have been suggested by Dr. Harley and other writers.

There can be no doubt that the orthography of the English language is, in common with many other languages, far from being perfect; and if it could be made more perfect without clashing with the prejudices and usages of society, the desired reform could excite no other feelings than those of satisfaction. Foreigners often draw our attention to the anomalies and inconsistencies of English spelling, and complain of the difficulties which such faults throw in the way of their easily and correctly acquiring the English language. They cannot understand why such words as "laughter," "draught," "taught," &c., should be spelt so differently from the way in which they are pronounced. If, they say, "d a u g h t e r" is pronounced as though it were written "dorter," surely "l a u g h t e r" ought to be pronounced "lorter," and not "lafter." On account of these and many like inconsistencies in English orthography, it might be desirable to make some change and to base our spelling on some more definite principles than those on which it at present rests. But the question arises, how is this change to be made, and who is to make it? With the exception of a few words which may be correctly spelt in either of two ways, Engligh orthography has become so settled and sterotyped in the minds of all English-speaking people, that it will be difficult to make any innovations in it without jarring with the prejudices of the commumity, or such as would be generally adopted. Any change of this kind, to be popular, must be gradual and very partial. It must be at first confined to a few words, the glaring inconsistencies of whose orthography and pronunciation have attracted general attention; and it must be introduced by some publication or class of publications which, in virtue of their high position, great literary merit, and large circulation, are the leaders of public opinion, and which attract the notice and claim the attention of all classes of society. Once let our leading newspapers—such as the *Times*, *Morning Post*, *Daily Telegraph*, &c.—spell certain words differently to what they are at present spelt, and then the public, by their constantly reading the papers, would get accustomed to the change, sanction it, and adopt it themselves. The great fault of all the spelling reforms hitherto projected, including that of Dr. Harley's, is that they are too "thorough," and aim at acomplishing too much at once. It is no answer to this objection to say, that what would not be accomplished by the passive consent of the community might be effected by the authority and recommendation of a Royal Commission. Such a method of revolutionising English spelling would never be, in our opinion, either desirable or practicable.

The changes proposed by Dr. Harley are not so radical as those which other writers have recommended, but even they are not such as literary men will readily adopt. The spelling of all similar vocal sounds with exactly the same letters of the alphabet, and the total disuse of the employment of similar letters to denote unlike vocal sounds is a scheme which has much to recommend it; at least, it would make the spellIng of such words a correcter index to their pronunciation than they are at present, and it would facilitate the acquisition of the language by foreigners. But the scheme is scarcely practicable, and the opinion of our educational reformers would probably be divided as to the propriety of the proposed change. It might be urged that the spelling of similar vocal sounds such as "draft" and "draught,' with different letters has this advantage, that it is an index to their respective meaning, so that the least glance at the word is sufficient to enable the reader to catch the sense of what he is reading, which would not be the case were they spelt in exactly the same manner.

The most extraordinary and least defensible innovation Dr. Harley proposes to make is the abolition of all duplicate consonants. One of his chief arguments in favour of such a scheme is that it would lead to a considerable saving of time and labour in writing, printing, and reading. Now that which appears to Dr. Harley a desideratum, appears to us a very questionable advantage. There is so much trash and nonsense written, and published, and read now-a-days, that it would be as well if more obstacles rather than more facilities were thrown in the way of both writers and readers. We are already inundated with an enormous amount of worthless literature, and what would be the result if people could not only "run and read," but run and write, we shall leave the reader to imagine. Another objection is that such an innovation would very seriously interfere with the etymology of the English language. Take only, for instance, its Latin roots and derivations, it would be a great pity to erase the noble and time-honoured impress which the literature and learning of the Roman Empire have left upon our language. There is probably no greater monument of the extent and grandeur of that Empire than those relics of its language which still give form and force to the vocabulary of most European nations. And it would be certainly an iconoclastic proceeding to obliterate from our language those marks which show how much we, in common with other nations, have been indebted to the ancient Romans for some of the most expressive and euphonious words we use. Nor can it be denied that more or less effacement of the signs which indicate the formation of the language would be effected were Dr. Harley's scheme carried into practice We have only for instance to take such words as "admitted," "accident," "accede," "occurred," "sufficient," "appropriated," "accelerate," "intelligent," and many others like them, to show how faint the marks of their derivation would become, were their duplicated consonants omitted. The word "occurred," plainly shows its latin origin, being spelt almost the same as the latin word itself; but how different would it be if it were written "ocured," as Dr. Harley would write it? The same may be said of the word "accelerate," which if written "axelerate," would lose half its etymological significance. Take again the words "acclamation," and "inflammation," in which the etymological significance of the single "m" in the one word, and the double "m" in the other is sufficiently apparent. And so we might go on with hundreds of other words, the derivation of which would be much obscured if duplicated consonan ts

were abolished. Nor should it be forgotten that the duplication or not of the consonant is often a guide to the correct pronunciation of the word containing it, and that the pronunciation of words with single and double consonants respectively is, with a few exceptions, guided by rules that must assist foreigners very much in studying our language. Dr. Harley states that the duplication of the final consonants, before adding to them a suffix, appears to follow no known law. But here he is mistaken, and the very words he cites in support of his proposition, show that he is wrong. The words "fit, fan, dig, run, stop, slip," &c., double the final consonant before the suffix "ing," because they are monosyllabic words, ending in a single consonant which is preceded by a single vowel. On the other hand, such words as "fish, work, stand, sling, &c.," do not double the final consonant because there are already two of them; and the final consonant is not doubled in such words as "stoop, real, sleep, &c.," because it is preceded by a double vowel. Again, in words of two and three syllables, it is usual to double the consonant if the accent is upon the last syllable, but not if it is on the first. Thus we write "regret, *regretted*," "refer, *referred*," "annul, *annulled*," "inter, *interred*, and so on; but we write, "differ, *differed*," "offer, *offered*," "enter, *entered*," &c.

It is, however, impossible here, nor is it within our province, to notice all that might be urged either in favour of, or against the changes which Dr. Harley proposes to make in English orthography. We are afraid his scheme will not find many supporters, and that he has much exaggerated both its value and its practicability. "Like the feat of making an eg [we copy his orthography] stand upon its end, skilfuly performed by Columbus, we hope to be able to do something nearly as wonderful, by suxesfuly propounding a useful practical scheme of English Speling Reform, which will not necesitate the slightest change in the fundamental organisation of the language, a feat which only apears (like that of the eg) to be incredible until its *modus operandi* is revealed." The reader will doubtless smile at Dr. Harley's temerity and complacency. Newton's discovery of gravitation, or Bacon's "Novum Organum," was not announced with so much ostenation; but then the feat of revolutionising English orthography will no doubt be found more difficult than that of either Newton or Bacon. However, the feat is not yet accomplished, and until it is accomplished, perhaps the less that is said about it the better.

Notes on Current Topics.

Treatment of Pyrexia of Enteric Fever.

During the last eighteen months, the anti-pyretic treatment of enteric fever has been carried out at the Bristol Royal Infirmary in a thorough and systematic manner, and Dr. J. Greig Smith, medical superintendent of that institution, has communicated the results of this treatment in a paper in the *Practitioner* for the current month. Our experience of the methods available for the reduction of temperature in enteric fever has led to a preference for the combined action of *quinine* and *cold-bathing*." Commenting on other methods of reducing the temperature, he observes that sponging the surface with cold water, or cold water and vinegar is an old method easy of application, and grateful to the patient; but its effect on well-marked pyrexia is very slight and transient. The *wet sheet*, with the body left without any further covering, is a powerful antipyretic agent, and when no bath is to be had, might be employed as one of the best substitutes. If the sheet be rubbed over with blocks of ice, a still more powerful effect is produced, and might be of great value in cases of sudden and intense pyrexia, such as sunstroke. The great objection to the wet sheet, is that it is not a cleanly process, and that it is equally difficult to test the amount of cold applied, and to regulate the effect of its application. "In hospital practice, and for most cases, the *cold bath* is probably the best physical means for the reduction of the pyrexia of enteric fever." A bath is wheeled to the bedside of the patient, who is lifted into it by means of the sheet on which he lies. With regard to the influence of the bath on the system, Dr. Greig Smith corroborates the opinion of Dr. McCombie, who in 1876, remarked that the bath diminishes restlessness and delirium, and produces sleep; and independently of sleep, there is a subjective ease and calm, with a diminution of subsultus, and an absence of carphologia. The effect of the bath upon the heart demands attention. Stimulants, however, observe Dr. Smith, we have never once had to give to a patient in the bath, which may be owing to the fact that the bath is not cooled down after the patient has been immersed, and that quinine is employed if the heart's action be feeble. The system is not prepared for a temperature of 60°, by lowering it from one of 90°, because that plan causes more depression, and certainly more discomfort. Quinine was found to be the best drug for reducing the temperature, but it must be given in large doses. From an adult man, 35—40 gr., for an adult woman, 30—35 grs., given in three or four doses in the course of three-quarters of an hour, will probably have the desired effect. There may be some degree of cinchonism, but there is also a marked improvement in the regularity, volume, and rapidity of the pulse, and often a decided increase of vascular tension and diminution of dicrotism. Free perspiration is common after the administration of quinine in large doses; and once there was marked increase in the urinary secretion. Dr. Smith insists upon the importance of giving the drug in sufficient doses, and "up to the very farthest limits of safety." In the Infirmary, 50 grs. have been given by the mouth to an adult male, and the same amount by the rectum to a girl of eighteen, with no evil result.

Operating Physicians.

We are glad to hear that the Board of Guy's Hospital has decided that in future the obstetric physicians shall not perform the operation of ovariotomy on the hospital patients, but call in the aid of the surgical staff for that purpose. This decision on the part of the authorities at Guy's Hospital will doubtless be approved of by the profession generally. From time immemorial it has never been the custom for a physician attached to a hospital to perform even the most simple operation. If only an

abscess had to be opened, a seton inserted, or the abdomen tapped, it was the duty of the surgeon to do it; and there is no reason why this good old rule should be broken in the case of so serious and difficult an operation as that of ovariotomy. On the contrary, there is every reason why the performance of this operation on a hospital patient should be left entirely in the hands of the surgical staff. It is one of those operations the success of which greatly depends upon the skill and experience of the operator, but how are surgeons to gain this skill and experience if obstetric physicians are to have full liberty to operate upon their patients. Even with regard to the welfare of the patient herself, the impropriety of such an innovation is sufficiently obvious. For surely, unless the operator is an experienced and very successful ovariotomist, the patient will be safer in the hands of a surgeon who is accustomed to perform all kinds of operations than she would be under the care of a physician whose surgical experience had been chiefly confined to the ordinary operations of obstetric practice. It may be said that every one must have their first time of performing any operation, but in the case of so formidable aud dangerous an operation as ovariotomy, it is certainly better that he who performed it for the first time should have had some previous experience in the minor operations of surgery, which very few obstetric physicians can say they have had. That division of labour, in virtue of which the respective duties of hospital physician and surgeon have always been well defined, has been generally found to be work well, and therefore it is to be hoped that the example set by the authorities of Guy's Hospital will be also followed in other quarters.

The Urine in Rabies.

Professor Robin, of Paris, has recently had occasion to analyse the urine of a patient suffering from rabies. It presented the following characteristics:—Diminution in quantity, abnormal density, very marked acidity, abundance of uric acid, diminution of urea and urates. On evaporation, he found crystals of hippurite of lime, margaric acid, leucine, and an enormous quantity of uric acid. The urine also contained bacteria of a special character.

We gladly note this examination, and trust that similar analyses may be made in all future cases. With reference to the bacteria, we might suggest some experiments, as to their action on animals, by injecting some of the urine into the blood, and watching the result. Other observers should look for them. The isolation of new forms of bacteria is an interesting and important subject. Too much care cannot be exercised in microscopical examination, and the actual existence of a special bacteroid in rabic urine, cannot be accepted, unless on the most exact, and most scientific evidence. A number of facts, by independent witnesses are consequently wanted, and judging by the number of rabid dogs reported to be at large, there will be only too much opportunity afforded of studying, not only the urine, but the general pathology of rabies.

French physicians have done much for the literature of rabies. We have acknowledged this, not only in justice but to avoid the reproach of ignorance or jealousy; but we at the same time have not forgotten the labours of English investigators and observers on this disease.

Our contemporary, the *Lancet*, in its issue of July 20th appears to be carried away by its admiration of the efforts of our French *confrères* to elucidate the problem of rabies, certainly to the neglect of English writers. MM. Bouley and Proust have just issued a short report on rabies—a very concise and practical compilation on the subject. The *Lancet* recommends this report as if it were new, and as if nothing of the kind had been previously done in England. We should be sorry to reproach our contemporary with ignorance of the crassest kind, or to insinuate any idea about jealousy. For the credit of English medicine we must, however, point out *that nearly every suggestion in MM. Bouley and Proust's report may be found in our reports on "The Nature and Treatment of Rabies." Still more, the description of the symptoms in the dog corresponds with not only our report, but with the account in Fleming's work, "Rabies and Hydrophobia."*

The appreciation of our work by *Brain*, the *Veterinary Journal*, &c., &c., affords a pleasing contrast, creditable to the scientific spirit of the editors, as they give credit where credit is due.

Sewer-gas and Ear-disease.

Mr. James Patterson Cassells, Aural Surgeon to the Glasgow Royal Infirmary, has recently published a paper read by him before the Glasgow Medico-Chirurgical Society, in which he endeavours to show that many cases of ear-disease are traceable to bad drainage and the escape of sewer-gas into the premises occupied by the patient. Many of the facts he adduces lend some support to his opinion, but still, they are scarcely sufficient to warrant the author in adding another disease to those for which bad drainage is already made accountable. Should, moreover, Dr. Cassells's views prove true, the situation will be by no means a pleasant one. For if disease of the ear may be caused by the escape of sewer-gas, why should not various other diseases be attributed to the same cause? We should then have bad drainage at the bottom of half the diseases that afflict humanity, and the only consolation would be that so many affections being attributable to one cause, by getting rid of that cause we should stamp out all the diseases arising from it. Sewer-gas has been recently made the scape-goat for so much disease, that when once good perfect drainage is everywhere established we may expect to have reached the millenium of good health. This little pamphlet of Dr. Cassells's will, nevertheless, put us on our guard against a possible cause of this class of affections, and should the experience of other aural surgeons corroborate the views above-noticed, the profession will have to thank Dr. Cassells for having been the first to draw their attention to the subject.

The Parkes Memorial Fund.

At a meeting recently held at Netley of the subscribers to the Parkes Memorial Fund, it was resolved—

1. That a prize of £100 in money and a large gold medal bearing the portrait of the late Dr. Parkes, be given triennially for the best essay on a subject connected with

hygiene, to be declared at the commencement of each triennial period, the prize to be open to the medical officers of the army, navy, and Indian services of executive rank on full pay (with the exception of the officers of the Army Medical School during their term of office).

2. That the subject for the first competition for the above-named prize be as follows: "On the Effects of Hygienic Measures in arresting the spread of Cholera."

3. That the essays be sent in to the Committee of the Parkes Memorial Fund, care of the Director-General, Army Medical Department, 6 Whitehall Yard, London, S.W., on or before December 31, 1880. Each essay to have a motto, and to be accompanied with a sealed envelope bearing the same motto, and containing the name of the competitor.

4. That a bronze medal (also bearing the portrait of the late Dr. Parkes) be given at the close of each session of the Army Medical School to the best answerer at an examination in hygiene.

The Utilisation of Sewage.

In a very sensible *brochure* on "The Poetry and Philosophy of Sewage Utilisation," the author, Mr. S. D. Girdlestone, makes the following apothegmatic remarks which, in our opinion, are well worthy of quotation:—"Man, who has received from the plant its noblest, has nothing to yield it in return but his ignoblest. The fruit of a man's life, his thoughts, his works, his love, all the highest products of his life are designed for his Maker, his neighbour, and himself. But the waste product, the vile, the refuse, the rejected, he owes to the soil from which they came, and if he pays not this debt, but casts it into the sea or river, he acts, to say the least of it, unnaturally, shall I not say dishonestly?" It is very possible that this particular paragraph may not be particularly noticed, but the reflection contained therein appears to us remarkably well put, and is in itself a strong argument in favour of sewage utilisation.

Remedy for Infantile Cholera.

Dr. Gross, in the St. Louis *Medical Brief*, says that the very best remedy in his judgment, for cholera infantum or summer complaint in children is calcined radix rhei.

His attentoin was called to it incidentally, during last August, whilst treating a little patient, aged six months, affected with this dreaded trouble, and had used all the reputed remedies for this disease, with little or no effect. He prepared some by putting a portion of the root in an iron vessel and burning it until it was easily pulverised. Of this he gave about five grains; the child became quiet and seemed free from pain, and in about three hours the bowels moved again, passing a changed and even larger evacuation than at any previous time; and from that moment it began to get better, and in a few days was entirely free from the disease. The success attained in this case led to the use of the same drug in a number of similar cases and with the same results.

In the forms of summer complaint incident to debility of the bowels, either when this condition depends upon general causes alone, or is the immediate effect of irritating ingesta or biliary derangement, rhubarb, in this form, is superior to almost every other medicine.

A Schism amongst the Counter-Prescribers.

A correspondent of the *Pharmaceutical Journal* describes the division of opinion amongst the chemists and druggists, as follows—

Events have apparently divided the trade into two camps, which though not in a state of actual hostility are verging upon it. One camp is filled by those to whom counter practice is bread and cheese; they wave aloft their banner of defiance and dare the foe to do his worst. The other camp is occupied by those who from various circumstances are not vitally interested in counter prescribing.

This being the condition of affairs, it follows that the party of defiance is enraged at the seeming lukewarmness in the cause displayed by the party of indifference, whilst this latter section of the trade is half inclined to laugh at the excessive and unwise ardour of their *confrères*, and thus a state of mutual irritation is kept alive between them.

It must be confessed that the desperate efforts of the thick-and-thin supporters of counter practice to retain what they consider to be their rights is but natural, when we reflect that to many of them the discontinuance of the objectionable practice implies the discontinuance of their means of livelihood, or the ruin of their schemes of fortune-making. And, indeed, if one might hazard a guess at the results of recent events upon the future conduct of the business, the prescribing druggists do seem to have good reason to dread that the axe is laid to the root of their most fruitful tree.

The Uses of Boldo.

An article in the trade journal, *New Preparations*, on this novelty, sums up its merits as follows:

From experiments made and the nature of the product, we may now conclude that the boldo is—

1. A most useful and profitable remedy in blennorrhagia.

2. That it produces always good effects in dyspeptic affections, when we recognise as the cause an atony or debility of the digestive organs, or when complicated by bilious disorders.

3. That its administration has been more than once favourable in chronic catarrh of the bladder.

4. That, the boldo, being balsamic and carminative, is an important auxiliary in the treatment of hepatic abscesses, whenever the febrile symptoms have been overcome.

5. That, considering the observations hitherto made in animals, and also a number which have been made in man, it is to be presumed that the boldo is a powerful anthelmintic, which presumption is corroborated by the qualities and the nature of the product.

6. That the decoction of the leaves may also serve very effectively in washing wine casks, to prevent them from souring; a practice followed by the native farmers since immemorial times.

Anatomical Preparations for Museum and Class Purposes.

Mr. L. C. Miall, of the Leeds Museum, writing in *Nature*, refers to many defects of the ordinary fluid-preservatives. Evaporation, blanching, spilling, optical distortion, the cost and inconvenient shape of glass vessels—these are among the serious and apparently inevitable advantages of dilute spirit. He has found it possible to get rid of all these difficulties together by mounting dissections and entire animals in glycerine jelly.

The following directions are his:—Soak gelatine (best quality) in water until it has absorbed as much as it can, melt and add an equal bulk of best German glycerine. Clarify with white of egg, one egg to a pint of mixture, taking care to boil very steadily, without burning. Filter hot through flannel. The jelly should be transparent, and of a pale straw-colour.

The jelly may be diluted with water, with glycerine, or with a mixture of the two. I find one part of jelly to one of glycerine and one of water a convenient proportion. The dilute jelly is apt to run fluid on exposure to the air, owing to the growth of moulds. This may be prevented by using a solution of salicylic acid or thymol in water for dilution. These substances cause opalescence in the medium, but a very minute quantity of acetic acid clears it again.

Lay out the dissection on wax, in a suitable glass vessel and fill up with jelly rendered fluid by gentle heat. When the vessel is full, allow the jelly to cool and set, then pour a little more on the top. After this also has set, lay the glass cover (warmed by immersion in hot water) in its place. As the superficial layer of jelly melts, press the cover down. When cold, cement the edges with strips of cloth smeared with coaguline.

The vessel for mounting may be of almost any size and size and shape. I have tried glass jars, built-up glass cells, ebonite, gutta percha, earthenware, and wood soaked in paraffin. Some of the writer's preparations have lasted five months without alteration. Previous immersion in alcohol, or other preservatives, does not prevent re-mounting in glycerine jelly. He has not as yet succeded with large objects, but mountings with as much as a pint of jelly have done well.

The cost of the jelly is not prohibitive, and when the freedom from loss by evaporation, or spoiling by turbidity and discoloration is considered, this mode of preparation will be found cheapest in the end. Harvey and Reynolds, of Leeds, undertake to supply the undilute jelly at a moderate price.

Antidote to Carbolic Acid.

The *Pharmaceutische Zeitung für Russland* says that on the recommendation of Professor Baumann, Dr. Sanftleben has used sulphuric acid in several cases of poisoning by carbolic acid with the best success, the phenol combining with the acid to form phenyl-sulphuric acid, which is not poisonous. He administered it in a mixture composed of diluted sulphuric acid 10·0, mucilage of gum 200·0, and simple syrup 30·0 grammes, in doses of a tablespoonful every hour.

Medical Superstitions in France.

In several of our previous numbers we alluded to superstitions in America and Ireland, and we published some of the popular remedies. One touch of nature makes the whole world kin, and man's absurdity is not confined to primitive countries, but extends to those who have the greatest pretensions to civilisation.

In France, in the Haute Loire, it is a custom to treat pleurisies, and almost all active diseases of the chest, by applying on the ribs over the seat of pain a gutted cock or a tom-cat if the patient be a male, and a gutted hen or a she cat if the patient be a female. The dead body is supposed to act as a magnet, and subsequently the patients drink some of the blood of the victims.

Consumption is warded off by goose dung and white wine; incontinence of urine by an omelet of roasted rats; peritonitis by cats' blood and menstrual discharge; Tinea capitis, "par uriner quelques jours sur la tête de l'enfant;" and puerperal after-pains are treated by making the woman swallow some of the uterine discharges.

If the curious reader will compare the *menu* of other countries for disease, he will find a singular correspondence between the various dishes or remedies, and that the popular ideas of treatment in countries remote from one another are based on almost the same absurd conceptions, which almost belong to the class of intuitive ideas.

Tarasp as a Health Resort.

This place is not so well known as Carlsbad, though the waters are somewhat similar. It has, however, a phalanx of old admirers who resort annually to it, not only because it is efficacious, but also more economical than Carlsbad.

The waters of Tarasp are recommended in gout, hæmorrhoidal conditions, scrofulous exudations, catarrh of the stomach, bronchial catarrh, diabetes, and tubercles of the lungs, especially when these are complicated with stasis of the portal system.

Tarasp is situated in the lower Engadine, *Canton Grisons*, and is situated 4,000 feet above the sea. The springs contain the component parts of those of Carlsbad, Marienbad, Kissingen, and Vichy, and as Dr. Julius Braun says: "In addition to its other advantages, we may enumerate its high situation, the influence of the rarified air in facilitating the change of substance, and in rendering the necessary vital stimulus more bearable, and in contrast to the complicated social relations of Carlsbad and Marienbad the conditions of a simple existence stimulated by the enjoyment of Alpine scenery."

The two principal springs are those of St. Lucius and St. Emerita.

Tarasp may be reached by way of the Practigau, Davas, Dorpli, and Fleula Pass, by Innspruck, or by Coire.

A melancholy death has recently occurred at Raleigh, in Essex. The deceased surgeon, Mr. Coles, M.R.C.S., Medical Officer of the Raleigh District of the Rochford Union, was on horseback, riding to a distant patient in the middle of the afternoon, when he suddenly fell from his horse and expired from heart disease. His horse, of which deceased was very fond, stopped instantly, and was found by the side of the body when assistance arrived.

Transmission of Syphilis by Tatooing.

UNDER the title "An Unsuspected Means of Syphilitic Inoculation," the *Lyon Medicale* tells us that a vagabond has been arrested in Pennsylvania who had given syphilis to a great number of artisans. His trade consisted in tatooing, and as his needles required to be moistened from time to time, he wet them with his saliva, his mouth being at the time full of specific ulcerations. The data in connection with this case are unfortunately insufficient, and, though of great interest, have received no scientific interpretation The subject has, however, been fully dealt with in a communication addressed to the *Progrès Medical*, in which some new facts as to the etiology, the incubation, and cicatrisation of extra-genital syphilitic sores are given.

The International Hygienic Congress

WILL commence its sitting on the 1st August in the Trocadero Palace, and a great number of visitors from foreign countries have notified their intention to be present. The Sanitary Institute of Great Britain, the Belgian Society of Public Medicine, the Communal Council of the City of Brussels, and many public departments have nominated delegates to represent them at the Congress, and the Paris Municipal Council has manifested its interest by a vote of 5,000 francs.

Abuses under the Artisans' Dwellings Acts.

A CURIOUS and somewhat discreditable story has come to light during the last sitting of the Metropolitan Board of Works, which explains why the Artisans' Dwellings Act for providing better homes for the poor is not carried out, or when carried out is done at such an expense to parishes, that the rents of the poorer classes are enormously increased. It appears, that in May of 1873, Mr. Storey became a member of the Vestry of St. Luke's, and in the same year he purchased one house in Chequer Alley, in that parish. From that date he continued to acquire property in the same locality. Improvements were in prospect, and on the 26th November, 1875, Dr. Pavy, the medical officer of the parish, made his first official representation with respect to the area comprised in the Whitecross Street scheme. The same month witnessed the preparation of a draft agreement under which Mr. Storey acted with Messrs. Smith and Gale in purchasing more land and houses. At the end of the year, Mr. Storey secured a certain property for £4,000, which fifteen months later he sold to Mr. Smith for £8,000, and on the 23rd of April last, this was transferred to the Vestry of St. Luke for £12,300, the sum asked being £15,300. Mr. Storey was then, and still remains, chairman in the improvement committee which made this purchase. The circumstance which has brought these instructive details to light, is the fact that Mr. Storey and his partners are now claiming from the Metropolitan Board of Works no less than £47,052, for some property required for the Whitecross Street improvement scheme, under the Artisans' Dwellings Act. Mr. Storey has recently been elected a member of the Board of Works, and a committee of that body has just declared that the public duties of the new representative are in complete conflict with his private interests. This Mr. Storey fails to understand, and as he refuses to resign, the matter is made public.

Popular Health Lectures.

THE managers of the Royal Polytechnic Institution have done wisely in inducing Dr. Croft to again take the reins of management of this popular place of scientific amusement; while he in turn is to be congratulated upon the way he has set about to retrieve the waning fortunes of an institution which has hitherto done good public service in popularising scientific subjects, and teaching its unscientific visitors the simple lessons of health, social economy, and those which abound unheeded "by the common herd" in everyday life, by the wealth of resources which it presents. Dr. Croft has now added to what should be considered its attractions a series of popular lectures on "Life, Health, Disease, Food, Cooking," &c. At the first of these, on Wednesday last, Dr. Richardson, F.R.S., presided, and congratulated the managers that the important subject of sanitation was included in their programme. We would, however, caution Dr. Croft to at once put his veto upon lecturers making their discourses a vehicle for advertising proprietary articles; popular lecturers are too apt "to do a friend a good turn," and many is the worthless article or medicament which has been foisted upon the public by these means.

IN the principal foreign cities from which returns are received by the Registrar-General the rates of mortality were—in Calcutta 33, Bombay 36, Madras 40; Paris 23; Geneva 21; Brussels 30; Amsterdam 24, Rotterdam 29, The Hague 25; Copenhagen 24; Stockholm 22; St. Petersburg 48; Berlin 52, Hamburg 29, Dresden 30, Breslau 32, Munich 35; Vienna 30, Buda-Pesth 39; Rome 28, Naples 39, Turin 26, Venice 21; Alexandria 55; New York 23 per 1,000 of the population. It will thus be seen that Berlin and Alexandria have now the highest death-rate in the world.

THE annual death-rate from the seven principal diseases of the zymotic class in the large towns of the United Kingdom last week was 7·0 per 1,000 of the population. Measles and whooping-cough showed fatal prevalence in Sunderland, whilst in Leicester, London, and one or two other large towns, diarrhœa may also be said to have been epidemic. In the latter city no less than 349 deaths occurred from this cause, the rate being only 23 for weeks previously.

OWING to the prevalence of infantile diarrhœa last week, the mortality in some of the large towns was very high. In Glasgow the death-rate reached 29 per 1,000 of the population, in London 26, which is excessive for the latter city, whose mortality is generally so low. Dublin gave but 23 per 1,000, and Edinburgh 20. In Sunderland the epidemic figure of 35 was reached, the next highest being Manchester, with 30 per 1,000 of the population.

THE Annual Meeting of the Irish Graduates' Association will be held in the Board-room of the Mineral Water

Hospital, Bath, on Friday, August 9, at 4 o'clock in the afternoon. President: B. W. Foster, L.K.Q.C.P., &c., Birmingham. President-elect: W. MacCormac, F.R.C.S.I., &c., London. The annual dinner will take place afterwards at the York House Hotel at 5.30 p.m.

In different parts of Costa Rica grasshoppers have appeared in alarming masses, particularly near Herodia, Alajeula, and Atenas, one of the most cultivated and fertile districts of the whole country. The coffee crop for this season has been nearly all destroyed by the plague.

Small pox caused 13 deaths in Dublin last week, and 19 in London. Of this latter number 8 were certified as unvaccinated, 2 vaccinated, the remaining certificates ave no information as to vaccination. There was also one death from this disease in Birmingham and in Liverpool.

The jubilee of 50 years' practice in the town of Jarves, Aberdeen, was held last week, when the profession of that place and neighbourhood met to receive and congratulate Mr. John Irvine, M.R.C.S., at a dinner given in honour of the occasion.

The profession will hear with regret of the death of Professor Rokitansky, which occurred at Venice last week. Of foreign physicians he was probably the best known, if we except Claude Bernard, during the present century.

The widow of Hahnemann, the founder of homœopathy, died recently, at the age of seventy-eight years, at the house in the Rue du Faubourg St. Honore, Paris, which had for a long time been her residence.

Literature.

SHORT NOTICES.

1. "Medical Etiquette." By a Licentiate of the Royal College of Physicians. London: Baillière, Tindall, and Cox. 1878.

2. "Phosphates in Nutrition." By M. F. Anderson, L.R.C.P.E. London: Baillière, Tindall, and Cox. 1878.

3. "Handbook of Uterine Therapeutics." By Edward John Tilt, M.D. London: J. and A. Churchill. 1878.

4. "Vichy." By Dr. Durand-Fardel. Published at Vichy by A. Wallon. London: Ingram and Royle.

5. "The Soldier's Manual of Sanitation." Adapted for Officers, Non-commissioned Officers, and Privates of the Active Forces, Malitia, Yeomanry, and Volunteers for Home and Foreign Service, In Peace and in War. By Surgeon-General Charles Alexander Gordon, M.D., C.B., &c. Second thousand. Baillière, Tindall, and Cox, London. 1878.

1. The inner life of the profession is rendered happier to its members, and more advantageous to society, by the observance of professional rules, and by the strictly honourable conduct of one practitioner towards another. Unfortunately in the struggle for existence, unworthy influences are at work to disturb the balance of justice, and self interest, supported by the lust for gain, prompts competitors to avail themselves of every means to catch the tide of public favour, and to secure patients, even to the injury of some brother practitioner. As, therefore, some are apt to forget the rules of medical etiquette, this publication is opportune, and the rules laid down by a Licentiate of the College of Physicians should meet with the approval of all those who have the interest and honour of their profession at heart.

2. During the last few years, the therapeutic action of phosphorus in its various forms and preparations has been more deeply studied and applied, and we have only to point to Parrish's chemical food as an instance of the growing feeling in favour of this agent, as a useful and necessary adjunct to the diet of delicate children. Easton's syrup, composed, as supposed, of the phosphates of iron, quinine, and strychnia, forms another popular and favourite method for restoring tone to debilitated systems.

This preference for mineral food has undoubtedly arisen from the chemical theories of disease, and we have in this work a further contribution to the value of the phosphates, based upon the theory that as certain mineral constituents are necessary to plants, and animals in health, all these mineral ingredients should be supplied in diseases of impaired nutrition, as starvation, fatty degeneration, rickets, scrofula, consumption, leprosy, cancer, and scurvy. The author tells us in his preface, that his conclusions have arisen from and grown from his investigations, and that from his record of a series of experiments he has formed the interpretation presented to his readers. There is much that is novel in his method of treating his subject, and in the explanation which he offers as a cause of certain organic diseases; though starting with no theory, he has yet managed by the force of circumstances, to drift into one.

The hypophosphates have been largely advocated for the treatment of consumption, and numerous cases are on record to establish their efficacy, but though the treatment has met with a certain amount of success, Dr. Anderson considers that it might be rendered much more successful by following his theory of supplying all the mineral ingredients of nutrition. This he has done "after some laboratory investigations;" he has made a "tissue phosphate, containing all the mineral ingredients which analysis has shown the coats of the aorta, and the different organs examined contain." (p. 168).

With this preparation he has treated successfully some well-marked cases of phthisis. We quote this as an instance of the tendency and seeming aim of the book.

We may safety say this *brochure* is characterised by a considerable degree of original and painstaking work, and we can recommend it as a useful contribution to the literature of the phosphates in reference to nutrition.

3. When a work has reached a fourth edition, it almost places itself beyond the pale of criticism, for it has thus achieved success, and established a claim to consideration and respect. The necessity for a new and enlarged edition of this book, almost conclusively proves that the study of the diseases peculiar to women in England, is receiving increased attention from the general practitioner, and thus one of the great objects of Dr. Tilt's efforts, the diffusion of a better knowledge of the diseases of women, is being accomplished.

The introduction is well worthy of the attention of students, and in the majority of Dr. Tilt's recommendations and advice, we heartily coincide. His convictions are forcibly and honestly expressed, though the following remarks are too sweeping and self-assertive.

It may be we want a check or break on uterine surgery, but we must have better evidence than the *ipse dixit* of one man, before we can become convinced of the necessity of "stamping out dangerous gynæcological tendencies, as in France." Dr. Tilt says:—"Uterine surgery soon took to leeching and to caustic treatment; thus Simpson set men to impale the womb on a fixed stem, and to deeply cut through the cervix to cure sterility. The mischief done by Simpson, and by the routine practice of his pupils, was limited to women in want of children. But Dr. Marion Sims pretends that by lateral cutting of the cervix, sterility is not only cured, but dysmenorrhœa, uterine displacements, and chronic inflammaof the womb. It is really difficult what to admire most in Dr. Marion Sim's *Notes*, the author's surgical ingenuity, or his profound ignorance of pathology." . . . .

"In England the womb is still under the reign of the knife, and it seems to be the same in America." (p. 6).

We think this page might be justly and advantageously toned down, or even pruned or excised. We cannot agree with our author on the subject of the examination of married women. The rule that we should always insist on the presence of a third party, is a wise one in general practice, though consultants in London, Dublin, or Edinburgh, may afford to

disregard it; the arguments in favour of it are stronger than those advanced by Dr. Tilt, who advises to let patients do just as they like. We heartily sympathise with Dr. Tilt's regret on the loss of faith in drugs, evinced by too many practitioners, and on the necessity of young men prescribing after the method of some of the old masters. He well says: "Those who from sheer idleness, order Vin de Baudon, Pilules de Blancard, Pilules de Vallet, &c., teach quackery to their patients, for these patent medicines are wrapt up in a flaming account of the number of complaints to be cured by some one remedy." (p. 21).

The general arrangement of the work is good, and in its present enlarged and improved form, will become a useful and practical hand-book for the general practitioner, though he will have to guard against the evident personal predilections of the author, and take some of his observations *cum grano salis*.

4. This little work from the well-known pen of Durand-Fardel, may be taken in the first instance as a guide to this popular health resort. It gives the topography of the place, the means and capabilities of the thermal establishment; its springs, the uses of its baths and douches in the various disorders of the stomach, liver, bladder, &c.; the seasons for vichy; analyses of the various springs, opinions of medical authorities, and lastly, as Vichy at home, when our patients, unable from one cause or another, to drink the water as it wells out from the rocks, formed by the calcareous deposit of unknown ages, are compelled to console themselves with "the next best thing," to drink bottled Vichy, or swallow Vichy salts and *bonbons* in their own homes. It is with this latter phase the profession of Great Britain and Ireland are most interested. Probably, not one patient in every hundred for whom we prescribe Celestins, Hauterive, Grand-grille, or Hôpital, is able to go through the course at Vichy; hence the rapid transport of the bottled waters in the present day is a desideratum of immense importance to the physician, as he is sure of almost daily supplies of the fresh article, which he can increase, diminish, or change whilst the patient is under his immediate notice. To all who are in the habit of prescribing this water—and who is not—this little book of about 250 pages will be exceedingly useful, especially as a guide to treatment; and though its "get up" is not what we are accustomed to see from English publishers, the information is none the less valuable, or the book less worthy of commendation.

5. We anticipated for this little work a wide circulation, and we gladly notice that it has reached a second edition. It is a most useful and practical manual, and as the instructions are simple and scientific, they should be read not only by medical men who have the charge of our regular and auxiliary forces, but by the officers, non-commissioned officers, and privates.

The preservation of the health of the soldier is a matter of importance to the state, to the medical officer, to the commanding officer, whilst to the soldier himself, it has an individual value even greater.

Ignorance of the ordinary rules of health is most deplorable in its results, and there can be no excuse at the present time for such ignorance, when the means of remedying it are placed within the reach of those most interested.

Army medical officers are now doing good work in extending a knowledge of the requirements of the soldier, and by teaching how to afford assistance to the sick and wounded.

The formation of ambulance corps in connection with the volunteer service, is another step in the right direction. The lectures given by the army medical officers will teach much, and be of the greatest practical assistance, and when these lectures are supplemented by reading such a book as Dr. Gordon's *Manual*, we may reasonably expect a wide diffusion of the laws of health, not only amongst our military, but civil population.

Medical News.

University of London.—The following is a list of the candidates who passed the last Preliminary Scientific (M.B.) Examination,—*First Division*,—Back, H. H., Bailey, C. F., Berry, J., Ellison, J. C., *Hoffmeister, G. B., *Overend, W., *Samways, D. W., St. Bartholomew's Hospital; Beevor, H. R., Porter, G. D., King's College; *Bourne, A. G., Collier, J., Croft, E. O., Dingley, E. A., *Fletcher, J. J., B.A., Syd. Forrest, J. R., Frankland, P. F., *Halliburton, W.D., Knight, F., Penrose, F. G., Pike, C. J., Tunzelmann, E. W. von, Wilkinson, W. C., B.A., Syd., Worthington, S., University College; Brogden, R. W., Champ, J. H., Dashwood, E. S., Hart, W. H., Lever, F., Price, J. A. P., Roberts, E., Starling, W. E., Stedman, C. R., Sutton, A. M., Guy's Hospital; Cooper, G. F., Dillon, J. P. C., Evans, C. S., Wells, A. E., St. Thomas's Hospital; Maye, J., London Hospital; Hichens, J. H., *Robbs, C. E., Epsom College; Rogers, J. M., Scott, B. C., Middlesex Hospital; Woollett, C. J., Charing Cross Hospital; Brown, J. G., Liverpool School of Medicine; Moore, H. C., University of Edinburgh; Onions, E. J. B.A., Private Study; *Ridsdale, J. G., Queen's College, Birmingham.

Second Division.—Batten, R. D., Bertram, B., Campbell, H., Carter, T. E., Hall, B., Hewer, J. L., Hoyland, S. S., Marsh, N. P., Walton. G. A. T., St. Bartholomew's Hospital; Brooks, W. T., Kelly, J. W. G., King's College; De Cordova, R. F. F., Downes, H., *Evans, W. H., Hoar, C. D., Irvin, F. D., Mason, A. H., Parry, J. M., Walker, J. E., Whish, M. S., Whitaker, J. J., B.A., University College; Cuff, R., Davies, W. T. F., Jackson, P. J., Guy's Hospital; Bruce, R. M., Dreaper, J. B., St. Thomas's Hospital; Beard, J., Beverley, J. M., Carnelly, M., Crowther, J., Gordon, E., Parkinson, C. J., Owens College; Dembski, F. E., Williams, A. J., Private study; *Maughan, J., Wilson, A. H., Liverpool Royal Infirmary School of Medicine; Clegg, W. W., Mayo, F. H., Yorkshire College; Smith, T. H., Welpton, J., Leeds School of Medicine; Herbert, C. A., Westminster Hospital; King, A., University of Edinburgh; Langridge, F. W., University College, Bristol; Little, E. M., St. George's Hospital.

*Passed also in the Mathematics of the first B.Sc. Examination.

Royal College of Physicians of London.—The following candidates having undergone the necessary examinations were admitted Members of this College on July 25th:—

Allbutt, Thomas Clifford, M.D. Csmb., Leeds.
Caton, Richard, M.D. Edin., Liverpool.
Cook, Henry, M.D. St. And., Shaldon, Teignmouth.
Cullingworth, Charles James, Manchester.
Moullin, J. Alfred Mansell, M.B. Oxon., 80 Porchester Terrace, W.
Osler, William, M.D. McGill Coll., 7 Savile Row, W.
Owen, H. Isambard, M.B. Camb., 41 Gloster Gardens.
Rose, Caleb, Ipswich.
Valcourt, Jules E. T. de, M.D. Paris, Cannes, France.

The following were admitted Licentiates on the same day:

Bamber, Charles J., St. Bartholomew's Hospital.
Chapman, Herbert Frederick, Richmond, Surrey.
Clark, Charles A. Dagnall, Cross Deep, Twickenham.
Francis, Ernest George, Sutton, Surrey.
Hammond, Thomas, 22 Stanley Place, S.W.
Hunter, Christian Bernard, 15 Grafton St., W.C.
Jones, L. Middleton Bowen, Gwarmacwydd, Llanfalteg.
Kitching, Walter, Heworth.
Lowdell, Charles George Walton, Wadhurst.
Morgan, Edward Smith, Swansea.
Norman, Alexander Stewart, Southsea.
Pearce, Charles Worth, 823 Commercial Road, E.
Rose, James, Royal Infirmary, Liverpool.
Sheppard, Charles E., 7 Addison Gardens South, W.
Sylvester, Geo. Holden, St. Bartholomew's Hospital.
Takaki, Kanehiro, 62 Fentiman Road, S.W.
Walker, Basil Woodd, London Hospital, E.
Weiss, Hubert Fobeaux, 7 Church Row, Fulham, S.W.
Wilson, Edmund Monkhouse, 4 Gilstone Road, S.W.

Royal College of Surgeons of England.—The following gentleman, having passed the required examination, received the diploma of M.R.C.S., at meetings of the Court of Examiners on the 23rd and 24th inst.:—

Aitken, E. M'Gruer, Glasgow.
Barton, G. Henry, Market-Rasen.
Birch, R. Charles, Manchester.
Casement, R. N., M.B. Dub., Ballycastle.
Cheetham, W. Henry, Horsforth, Yorkshire,

Child, W. Long, Belsize Park.
Chisholm, J. Merritt, M.B. Ed., Edinburgh.
Clarke, H. Joy, M.B. Ed., Doncaster.
Coleman, G. Edward, L.R.C.P. Ed., Pontefract.
Dixson, Craig, M.B. Ed., Sydney, New South Wales.
Guillemard, B. J., M.B. Ed., Hythe, Southampton.
Handford, H., M.B. Ed., Atherstone, Warwickshire.
Jackson, Arthur, L.S.A., Grays, Essex.
Jones, Robert, Liverpool.
Keep, C. Henry, Calcutta.
King, H. William, M.B. Ed., Bury St. Edmunds.
Knox, Charles, L.S.A., Birkenhead.
Langley, P. W. Leslie, M.D. Dub., Waterford.
Leak, Hector, Winsford, Cheshire.
Lloyd, G. Jordan, L.S.A., Birmingham.
Lofthouse, John, Rochdale.
Moore, J. Wesrwood, Birmingham.
Mouritz, A. Albert, Runcorn, Cheshire.
Newton, R. Arthur, L.S.A., Birmingham.
Nixon, T. Ayrton, Middleborough-on.Tees.
Osborn, W. Henry, Birmingham.
Pughe, T. W. Owen, Liverpool.
Rennie, S. James, Cumberland.
Rowe, G. Herbert, York.
Stone, A. William, Knottingley, Yorkshire.
Swann, Alfred, M.D., Bradford, Yorkshire.
Walter, E. William, L.R.C.P. Ed., Broadstairs.
Wheeler, W. Henry, Clifton, near Bristol.
Williams, M. Melbourne, Chorley, Lancashire.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

A. WALLACE.—Your communication will appear in our next.

LOCAL NEWSPAPERS.—We have to thank correspondents for sending us copies of local newspapers containing matters of medical interest. At the same time they would be more certain of receiving attention were the articles to which our attention was intended to be drawn, marked in some way; as, in the necessarily hasty glance through the large number of journals which come before us, we often fail to notice a particular paragraph.

MR. B. S., London.—Your communications are too much of the nature of an advertisement, and cannot be inserted except as such. Please communicate in future on these matters to our publisher.

DR. HOLMES is referred to the notice to Mr. B. S., London.

MR. J. L. B. will find the subject referred to in our editorial columns of the present number.

A GOOD PRESCRIPTION.—The late Mr. Justice Byles, says our contemporary the *Leisure Hour* for August, had a most shrewd and ingenious manner of adapting stern and unyielding facts to the most clever theory of science. We recollect the conviction before him at Exeter of a lady who was perpetually stealing trifling articles from the shops she patronised. Being "called upon" for judgment, her counsel argued that she was the victim of *Kleptomania*. "Kleptomania!" asked the judge, in the most innocent manner; "What *is* kleptomania?" "A disease, my lord," said her counsel, "the subject of which is uncontrollably addicted to larceny." "Oh, I see," said the judge; "and a disease, sir, which the judges are sent on circuit, as physicians, to cure. *My* prescription on the present occasion is twelve months' imprisonment with hard labour!"

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. W. Goodell, Philadelphia. Dr. C. P. Knapp, Wyoming, Pennsylvania. Dr. E. Skeate, Bath. Dr. P. H. Colmer, Yeovil. Dr. Harley, London. Dr. French, Portland. Mr. Hills, Guy's Hospital. Dr. Kelly, Rotherhithe. Dr. Farre, London. Mr. Messenger Bradley, Manchester. Dr. W. Curran, Mussore, India. Dr. Langdon Down, London. Mr. Swan, Dublin. Dr. Leeson, Wharfedale, Yorks. Prof. Tichborne, Dublin. Mr. John Gay, London. Mr. Cotterell, University College Hospital. Dr. Drewry, London. Dr. Hamilton, Colnbrook, Bucks. Mr. Heather Bigg, London. Mr. Marlett Boddy, Camberwell. Dr. Molony, Dromahair. A Medical Student. A Candidate for the Fellowship M.P.S.I. Dr. de Fonmartin, Greenwich. Mr. Scott, Edinburgh. Dr. Dolan, Halifax. Mr. Blackett, Society for Relief of Widows of Medical Men. Dr. Ormsby, Dublin. Dr. Owens, Long Stratton. Mr. C. Redmond, Waterford. Dr. Balmanno Squire, London. Dr. Stretch Dowse, Hornsey. Mr. F. Lanchester, London. Mr. Rose, Finsbury. Mr. Ilderton, Manchester. Dr. Liveing, London. Dr. Thorowgood, London. Mr. Stott, Disley. Dr. Holmes, London. Mr. W. Starr Whatford, Brighton. Mr. Norris, Paris. Dr. George Beard, New York. Dr. M. Thomas, Glasgow. Dr. J. R. Chadwick, Boston. Dr. Carpenter, London. Mr. Jabez Hogg, London, &c., &c.

VACANCIES.

Braintree Union, Essex.—Medical Officer of Health. Salary, £35 per annum. Applications on or before August 10 to the Clerk of the Union.
Carlow Union, Ballickmoyle Dispensary.—Medical Officer. Salary, £120. Election, July 31.
Clayton Hospital, Wakefield.—Resident Surgeon. Salary, £120. Applications to the Hon. Sec. on or before August 12.
Devonport, Royal Albert Hospital.—Resident Medical Officer. Salary, £200, with board and apartments. Endorsed "Application for Appointment" to be sent to the Committee on or before August 2.
Kenmare Union, Tuosist Dispensary.—Medical Officer. Salary, £100. Election, August 8.
Narberth Union.—Medical Officer for No. 2 District. Salary, £35, with fees extra, and £10 additional as Health Officer. Applications to the Clerk of the Union.
Omagh Union, Omagh Dispensary.—Medical Officer. Salary, £100. Election, August 10.
West Riding Asylum, Wakefield.—Clinical Assistant. Board and residence, but no salary. Applications to Dr. Herbert Major, at the Asylum.

APPOINTMENTS.

BARKER, W. H., B.A., M.R.C.S.E., Junior Assistant Medical Officer to the Southamptonshire Lunatic Asylum, Knowle.
BOULSON, A. E., M.R.C.S.E., Medical Officer for the Horncastle District and the Workhouse of the Horncastle Union.
BOWES, W., M.R.C.S.E., Assistant Medical Officer to the Ipswich Lunatic Asylum.
BOYD, S. B., L.R.C.S.Ed., Medical Officer, &c., for the Ballymoney Dispensary District of the Ballymoney Union, co. Antrim.
FORSTER, F., L.R.C.S.I., L.R.C.P.Ed., Medical Officer, Medical Officer of Health, &c., for the Roadford Dispensary District of the Enniskymon Union, co. Clare.
HEARD, C. G., M.R.C.S.E., Medical Officer for the No. 3 District of the Bridlington Union, Yorkshire.
JACKMAN, W. T., M.R.C.S.E., Assistant Medical Officer to the Greenwich Union Infirmary.
MACDONALD, Mr. D. S., House Surgeon and Apothecary to the Northern Infirmary, Inverness.
MORTON, A. C., M.R.C.S.E., House Surgeon to the Great Yarmouth Hospital.
NEWTON, J., M.R.C.S.E., a District Surgeon to the Salford and Pendleton Royal Hospital and Dispensary, Manchester.
RUSSELL, W., M.B., C.M., House Physician to the Wolverhampton and Staffordshire Hospital.
RYGATE, B. R., M.B., Resident Accoucheur to the London Hospital.
TODD, J., M.R.C.S.E., Medical Officer for the No. 2 District of the Lunesdale Union, Staffordshire.

Births.

HAMERTON.—July 31, at Sutton-in-Ashfield, Notts, the wife of M. F. Hamerton, M.B., M.Ch., T.C.D., of a son.
PRESTON.—At Kilkeel, co. Down, the wife of Eyre Preston, M.D., of a daughter.

Deaths.

ASHTON.—On July 18, at Burscough, Ormskirk, Thomas M. Ashton, M.D., aged 66.
COLES.—On July 13, at Rayleigh, Essex, Richard Coles, M.R.C.S.E., aged 45.
DARTNELL.—On July 22, at Ardenville, Leamington, George Russell Dartnell, M.R.C.S.E., Inspector-General of Hospitals, aged 78.
DOWNEY.—On July 12, at Sileby, Leicestershire, Patrick Downey, L.R.C.S.I., aged 66.
DRIVER.—On July 11, at Cheltenham, William Edwin Driver, M.R.C.S., aged 69.
LANE.—On July 6, at Rockfort, Bandon, co. Cork, William Beamish Lane, L.R.C.P.L. aged 39.
LOWDER.—On July 20, at Ryde, Charles D'Oyley John Lowder, M.D., aged 73.
MILLAR.—On July 24, at Penrhos, Carnarvon, Charles Millar, M.D., aged 68.
SCOTT.—On July 6, at Lauriston Place, Edinburgh, Alexander Scott, Surgeon, aged 82.
STEEVES.—On July 17, drowned at sea, Howard Douglas Steeves, Surgeon, aged 28.
WEBSTER.—On July 20, at Camberwell, Henry Webster, M.R.C.S.E., late Surgeon, Madras Army, aged 46.

Clinical Lectures.

ON INTRA-CRANIAL ABSCESS.

By S. MESSENGER BRADLEY, F.R.C.S.,

Surgeon to the Manchester Royal Infirmary, and Lecturer on Practical Surgery, Owen's College.

Gentlemen,—We have recently had two cases of intra-cranial abscess under observation, which I think are sufficiently instructive to form the material for a clinical lecture. Let me first draw your attention to the case of the man now present. He is, as you see, a fairly strong and healthy-looking man of about 45 years of age. Six years ago, he informs me, that he had a small tumour removed from the right side of the forehead, and believes that the bone was injured at the time. What he is quite sure about is that the scar never firmly healed, and after some months, matter began to exude in a small but continuous stream. This state of things has continued from then to now. At times the matter ceases to escape, and then his head begins to ache, relief always ensuing upon the re-opening of the abscess. Beyond the occasional pain, however, there never have been any symptoms whatever. His memory and all his psychical functions have remained undisturbed, his temper is unchanged, he has never suffered from convulsions or affections of special sense, or from any form of paralysis. On examination, I found that a probe led directly backwards through the small sinus in the skull for two inches and a half, apparently passing into the substance of the brain. The withdrawal of the probe was followed by a free discharge of matter. This matter was perfectly odourless, and under the microscope was found to be free from bacteria. A week after admission I exposed the outer cranial opening of the sinus, and applied a trephine around the margin. The button of bone removed measured half an-inch in thickness, and was very dense (sclerosed.) On withdrawing the piece of bone a large quantity of matter, estimated at about four ounces, escaped from the wound. This matter rose and fell synchronously with the systole and diastole of the heart, and as we subsequently demonstrated, and now show you, was remarkably affected by respiration, a deep inspiration causing a marked increase of brain pressure, and consequently a considerable overflow. The abscess cavity being washed out, we could see the dura mater beneath separated from the bone, and forming the posterior boundary of the pus cavity. The probe further showed that this separation extended for about 1½ inches round the opening in a circular manner. The man has suffered no inconvenience whatever from the operation; the cavity is washed out every morning with No. 40 solution of carbolic acid, and, as you see, the granulations are springing up from the bottom, and will ere long entirely obliterate and fill up this large hole. The headaches have quite ceased.

Now consider, gentlemen, the sequence of events in this interesting and instructive case. The operation six years ago was followed by ostitis, which in its turn led to a localised meningitis. No necrosis or pyæmic infection followed, as so often happens, but the pericranium was stripped off for a certain distance, and an abscess formed between the membranes of the brain and the skull cap. The French say "it is the unexpected which always happens," and truly here what did happen no one would have foretold, for the pus, according to its wont, making its way out, bores a channel, not in the line of least resistence, *i.e.*, towards and into the brain itself, but perforates the thickened sclerosed bone and escapes externally. Probably the absence of psychical disturbances in this case was due to the gradual way in which the brain underwent compression, allowing it to adapt its functions to its altered circumstances, or may be by permitting the opposite hemisphere to take on vicarious action. As a matter of collateral interest in this case, I would further draw your special attention to the circumstance that in spite of the long contact with the atmospheric air, the pus remained perfectly aseptic and free from bacteria.

Let me now, gentlemen, contrast this case with another

of cerebral abscess, which ran a very different course ; and having done so, I will say a few words as to the symptoms and prognosis of intra-cranial abscess generally.

About four months since a strong, healthy, young fellow, twenty years of age, was brought into the infirmary suffering from a compound fracture of the occipital bone, the result of a blow given in a street row. There was no depression of bone, and he informed me in strong Doric that "nowt ailt him." He certainly experienced little or no pain. The scalp wound soon healed, and contrary to orders, he left the hospital in about a week. He was brought back two or three days later by his friends, who stated that while at home he had had a fit. He was now somewhat lethargic and vacuous in manner, his temperature rose, his tongue was thickly coated, and his pupils were unequal. Encephalitis being diagnosed, a smart purge was administered, and cold was applied to the shaved head. He remained in much the same state for ten days; the temperature, generally normal in the morning, rose slightly towards evening. He had no pain, or sickness, or convulsions, but he became more and more lethargic, and died on the eleventh day following the onset of encephalitis, and the fifteenth after the injury. On *post-mortem* examination an abscess was found beneath the seat of fracture, deep in the substance of the occipital lobe, measuring one inch in diameter. The membranes above were quite healthy.

These cases sufficiently illustrate some general features of intra-cranial abscess to serve our purpose. First, as to the *causes* of the affection—in the first case a scratch with a knife, in the second a compound fracture of the skull acted as equally efficient agents—and so we find that all sorts of injuries, from the most trifling to the most severe, serve to set up suppurative inflammation within the skull. Next as to *locality:* the abscess in the first case was situated between the bones and the brain membranes ; in the second, deeply in the substance of the brain. Besides these situations the matter may form between the membranes and the brain, or within the cavity of the arachnoid, and may be placed either immediately beneath the site of original injury, or at any part of the encephalon, even being formed, by the action of *contre-coup*, at a spot directly opposite the one struck.

As to date of occurrence, this too, is subject to wide variation. There may be no perceptible interval between the receipt of injury and the onset of encephalitis ; or weeks, or even months, may elapse. As a rule, the quicker the advent, the acuter is the encephalitis, and the more rapidly fatal. Meningitis, again, ensues more quickly than cerebritis, which, indeed, is often very slow and insidious in making its attack. Next, gentlemen, let us speak of the *symptomatology.* The ordinary symptoms of pain and pyrexia "go without saying," though they both differ in different cases. Thus, the pain ranges from a dull trifling pain to acutest agony, and the pyrexia from a slight evening rise in the temperature to the highest note in the thermometric gamut. In the meningeal inflammation, as elsewhere, the symptoms are more acute, in the visceral more masked and obscure ; but it is rather to the special symptoms that I wish to invite attention. Now, in regard to the special symptoms, they will manifestly depend upon the locality of the abscess—in a word, we are entirely guided by our knowledge of the localisation of the cerebral functions in making our diagnosis of the position of an intra-cranial abscess. If situated along the course of the Sylvian fissure there will probably be some convulsion, or paralysis of certain muscles, or groups of muscles, of an arm or a leg ; if involving the anterior cerebral lobes, we should expect psychical manifestations—loss of memory, it may be—or some aberration of intellect, dementia, or phrensy ; if the third left frontal convolution be destroyed, aphasia would probably follow ; if the angular gyrus or the upper tempero-sphenoidal, or the hippocampal convolution were invaded the special senses of sight or hearing, or the common sensation of touch might be lost ; if the cerebellum be partially destroyed we should be aided in our diagnosis by a want of harmony in the muscular movements ; while the functions of organic life, of respiration, and circulation, would be interfered with were the medulla the seat of the abscess ; and, lastly, some mental disturbance, but not any paralytic affection, would probably attend invasion of the occipital lobes. By way of confirmation of this latter statement, I may adduce the case of a man who died from a large abscess in the occipital lobe, and whose chief symptom consisted in his getting out of bed, removing his shirt, and urinating in the middle of the ward ; yet this man answered questions coherently enough, and in all other respects seemed a staid, respectable fellow. There are cases, it is true, where symptoms do not accord with what is known of the localisation of the cerebral functions, but these may be understood without falsifying our present views. I once saw a case of complete destruction of the third left frontal convolution by a gummatous tumour, and yet there was no aphasia ; and, again, in the first case mentioned to-day, we have a large abscess pressing directly back upon the right cerebral hemisphere, and with a complete absence of any cerebral symptoms, but in both these cases the nervous pulp was slowly invaded, and either vicarious action was taken on by the opposite hemisphere, or the brain adapted itself to the pressure. Similarly, Goltz, in his celebrated experiments, produced a monoplegia, or a convulsion of certain muscles, by washing away certain parts of the brain, but after a time the functions of the brain were restored, and all went on as if nothing had happened. Such results, however, only follow when the abscess is slow in forming, and not often then ; when suppuration is rapid we may always expect pressure-effects, which as we have said, will directly depend upon the part of the brain pressed upon. (*a*)

Perhaps sufficient has been said to show how doubtful in many cases our diagnosis must be, and hence our *treatment* must often, indeed, generally can only be, of a tentative nature. Of course, if we have undoubted evidence of pus, as we had in the first case, then, no matter where it be situated, our duty is to evacuate it, but it does not often happen that we have sufficient evidence to enable us to positively diagnose its presence. We can, in fact, only get as far as the encephalitis.

Think again, for a moment, of our first case ; had there not been the sinus the only symptom we should have had would have been headache — persistent headache for six years—hardly enough to warrant us in trephining a man's skull ; yet nothing short of this would have cured his cephalalgia.

If, following an injury, the periosteum leaves the injured skull and forms a puffy tumour (Pott's puffy tumour) ; if we have, along with this, a rigor, or rigors ; if we have much pyrexia, and if the symptoms remain at a certain point without much change, we should have enough to guide us in diagnosing pus, in warranting us in trephining the skull, and in laying open the membranes, or if the pus were not there, in incising the brain itself ; but these "ifs" are uncommon, and not often associated. So long, then, as the diagnosis of intra-cranial abscess remains obscure, so long must treatment be uncertain, but when once we are able to satisfy ourselves that pus is present within the skull, no matter where the symptoms lead us to infer its location, we should trephine, and seek to evacuate the matter, certain, as we must be, that no other treatment can possibly succeed, and knowing that this may very probably save the patient's life.

(*a*) The phenomena attending embolism graphically illustrate the effects of *sudden* interference with the nourishment of the brain. Thus an embolus blocks the left middle cerebral artery, and aphasia, facial palsy, and rigid hemiplegia ensues—though but a passing giddiness perhaps follows the ligature of the left common carotid artery. In the former case the collateral circulation is weak, only taking place over the brain cortex, and the effect proportionately severe. In the latter, the free anastomosis at the base of the brain saves the organ from all consequences.

Original Communications.

ON THE PHYSIOLOGICAL ACTION OF THE BARK OF ERYTHROPHLEUM GUINENSE, GENERALLY CALLED CASCA, CASSA, OR SASSY BARK.

By T. LAUDER BRUNTON, M.D., F.R.S.; and WALTER PYE, Esq.

(*Continued from page* 81.)

General Action on Birds.

Birds are affected very readily by the poison, and the symptoms produced in them are similar to those observed in mammals. This will be seen by the results of the following experiment.

Experiment V.—A full-grown pigeon had nearly 1 cub. centim. of the solution injected beneath the wing. In ten minutes a quivering motion of the wings was noticed; in a quarter of an hour its wings were puffed out, its gait was staggering; twenty-four minutes after injection it began to vomit. This was repeated four minutes afterwards more violently, and several times subsequently. Forty minutes after the injection it was unable to stand; and from that time to its death, one hour and thirty-five minutes after injection, it lay flat on the table, occasionally attempting to vomit unsuccessfully. For the last forty minutes its respirations were hardly visible, but it moved when roused. Violent expiratory movements came on just before the respiration finally ceased.

General Action on Fishes and Frogs.

In fishes and frogs there is but slight susceptibility to the poison, and the effects produced by it are similar in the two classes. The most obvious general symptoms are muscular paralysis and cessation of respiration, preceded by spasmodic movements. It will be seen later, however (Experiment XVIII.), that the particular action of the heart is well shown in frogs.

Experiment VI. February 21.—One-third of a cub. centim. of the solution was injected beneath the skin of a medium-sized frog. In two minutes slight tonic contraction of the limbs was observed; in four minutes it was jumping rather actively, but fell over on its back; in twelve minutes the respiratory movements had become almost imperceptible; and from this time the reflex movements of the limbs on irritation gradually got weaker and weaker, and finally ceased thirty-three minutes after the injection. After death the ventricle was found firmly contracted, the auricles and venous trunks engorged.

Experiment VII. February 21.—Experiment VI. was repeated with double the dose. The frog was slightly larger than the one first used; but reflex action ceased within a few seconds of the same time after injection. The general effects were almost the same as in Experiment VI., save that five minutes before reflex movements ceased there were four spasmodic inspirations.

Experiment VIII. April 18.—The effect on fishes was tried. First, 55 cub. centims. of a $\frac{1}{100}$ watery solution of casca were added to three litres of water in which a gold-fish weighing three ounces was swimming. At the end of three hours no effect was produced on the fish. 1·3 cub. centim. of the alcoholic solution were then injected into the side of the fish, a little in front of the tail. In five minutes it began to roll from side to side; the respirations were catching. For the next ten minutes it lay chiefly on its side, occasionally swimming about actively. At the end of twenty-five minutes it appeared to have nearly recovered itself, and one cub. centim. more of the alcoholic solution was injected. In three minutes from this time it lay completely over on its side, having spasmodic twitchings of its fins; in five minutes the respirations again became rapid and gasping; in ten minutes the reflex movements were very weak, but respiration and reflex action did not cease before thirty minutes after the second injection.

General Action on Invertebrata.

The drug exerts very little, if any, poisonous action on the invertebrata.

Effect on the Development of Bacteria. Experiment XIII.—This experiment, which was repeated on two other occasions, shows that a weak solution of the alcoholic extract possesses the power of hindering the formation of bacteria, a property not shown by the watery extract, as is shown in Experiment XIV. This difference in the properties of the two extracts does not show itself in the general action of the drug on animals; but the power of the alcoholic extract to prevent the development of bacteria, while it is without action on them after their development, is interesting, as substantiating the results of Buchholz's experiments on the subject with other drugs. (*a*)

Three pieces of fresh muscular tissue were placed in bottles on March 22nd. The first contained a watery solution of the alcoholic extract of casca, the second a one two-hundredth solution of sulphate of quinine, and the third distilled water. On March the 29th the bottles were opened; and while the bottle containing water was very offensive, and the water was crowded with bacteria, neither the quinine nor casca solutions contained any bacteria at all.

The bottle containing the casca solution was again examined on May 14th, and was found, as before, quite free from bacteria. Long before this a thick crust of *Penicillium* had formed on its surface.

Experiment XIV.—A piece of fresh cat's liver was placed in a solution of casca of the same strength as that used in the preceding experiment; but the watery extract was used instead of the alcoholic. At the end of two days the liquid was found to be crowded with bacteria.

This experiment was afterwards repeated with muscular and other tissues with the same result.

Effect on the Life of Bacteria—The effect of the drug on the life of bacteria when developed was tried in Experiment No. XV. For this purpose an infusion of hay was made, and found to contain many rod-shaped bacteria. To a drop of this infusion a drop of one-twentieth solution of both the alcoholic and the watery extracts of casca was added at different times, and the movements of the bacterians carefully watched under the microscope. They did not, however, seem in any way affected by the addition.

For the sake of comparison a one-hundredth solution of quinia sulphate was added to the hay infusion. The bacterian movements were found to be instantly stopped.

Effect on Red and White Blood-corpuscles.—In Experiment XVI. the action on the red and colourless blood-corpuscles of the newt was investigated. The effects produced by the addition of dilute solution of casca to the blood were cessation of amœboid movements and rounding of the white corpuscles, with an irregular shrinking of the nucleus, and general crenation of the red ones. These effects were probably due to the action of the tannic acid contained in the extract.

Action on the Digestive System.

One of the most prominent symptoms of poisoning by casca is the violent vomiting which it produces; and, as has already been noticed, its occasional purgative action is used as a test of innocence or guilt. The emetic or purgative action is supposed by some to depend on the administration of a pure infusion, or of one containing the drugs in suspension, and innocence or guilt are thus supposed to be practically decided by the priests, who have it in their power to administer either one or the other to the accused.

In order to test this, an infusion was given to one cat, B (Experiment XXI.), and an infusion containing a quantity of powder to another. The latter, however, contrary to expectation, recovered, whereas the former died. The experiment, however, was vitiated by the fact that the infusion was made from the finely pulverised bark, the only kind we had at our disposal at the time, and consequently

(*a*) Archiv f. exper. Pathologie u. Pharmakologie, iv. p. 1.

contained a quantity of it in suspension, which would not have been the case if the infusion had been made from a coarsely pounded bark.

In order to ascertain whether the vomiting and purging were due to the local action of the drug on the stomach and intestines, or to its action on the nervous system after its absorption into the blood, a comparison was made between the effects of the poison when introduced into the stomach and when injected under the skin. Our experiments show that whereas vomiting was invariably produced by the casca in whatever manner introduced into the system, purging only occurred when the poison was given by the mouth, and was never observed after subcutaneous injection. The purgative action is therefore due to the local action of the drug on the intestines.

The following is a brief account of two experiments we made in investigating the action of the drug when injected into the stomach.

Experiment XXI.A. May 10.—Ten cub. centims. of an infusion of the watery extract of the bark, with the dregs which were deposited when the infusion cooled, were injected into the stomach of a large cat. It appeared quite well for forty minutes, and then vomited. Within the next two hours and a half it vomited five times. A little more than five hours after the exhibition of the drug it passed some solid fæces with great forcing, and from that time recovered.

Experiment XXI.B. May 10.—Ten and a half cub. centims. of a cold aqueous infusion of the pounded bark, containing numerous fine particles in suspension, were injected into the stomach of a small ill-nourished cat. Vomiting came on thirty-five minutes afterwards, and free purging an hour and a half after the injection. During the rest of that day and on the next it was very feeble, but showed no special symptoms, and it died quietly on the morning of May 12.

In order to ascertain whether the vomiting was due to the action of the drug upon the sensory nerves in the stomach itself, after it had been conveyed to that organ by the circulation, or to its action upon the nervous centre in the medulla oblongata regulating the movements of vomiting, the vagi were cut, and the chief sensory nerves of the stomach thus divided, before administering the poison. By this procedure the retching and vomiting were either completely prevented or very greatly diminished, the dyspnœa rendering it rather difficult to decide in some cases whether some convulsive movements were due to it or were movements of retching. The vomiting is therefore chiefly, and in all probability entirely, due to the action of the drug on the sensory nerves of the stomach itself, as the retching, if indeed really present, might be due to irritation conveyed to the medulla through the splanchnics after the vagi had been divided.

Action of Casca on Respiration.

Powdered casca, when inhaled, acts as a violent sternutatory. All the men employed by us in grinding or pounding the bark suffered severely from the violent and irresistible fits of sneezing which attacked them; and in one instance these were accompanied by great faintness and tendency to syncope.

When injected into the circulation casca greatly accelerates the respirations (Experiments I., II., XXXIV.).

This acceleration appears to be due to stimulation of the pulmonary branches of the vagus, and not to any action of the drug upon the respiratory centre, as no acceleration is noticed when the vagi are divided before the injection of the casca (Experiments XXIII. and XXIV.).

Action of Casca on Circulation.

Experiment XXVII. *Preliminary Experiments on Frog's Heart.*—A watery solution of the alcoholic extract and a standard salt solution were prepared; the hearts of two frogs of about the same size were then removed, and placed for a minute or two in ·75 per cent. salt solution. When they had recovered from the shock of removal, and were beating regularly, one was placed in the casca solution, the other in the salt one. At the commencement of the experiment the heart, A, placed in salt solution was beating at the rate of 6 per 10 seconds; the heart, B, in casca at the rate of 75. Both hearts became weaker and their pulsations slower; at the end of 50 minutes the heart in casca stopped entirely, that in salt solution pulsated feebly at the rate of 3 per 10 seconds. In 15 seconds more it stopped.

In Experiment XXVIII. we repeated the foregoing experiment with a much stronger casca solution. The hearts at the commencement of the experiment were beating at the rate of 4 per 10 seconds. At the end of 30 minutes the heart, B, in casca, which had previously got very slow and weak, stopped, while the standard heart, A, was still beating strongly and regularly at the rate of 4 per 10 seconds.

Experiment XXIX.—The heart of a frog whose cerebrum had been destroyed was exposed. Pulse 72 before injection.

h m
11 40. Injected 2 cub. centims. alcoholic solution beneath skin of back.
11 50. Pulse 60; regular.
12 2. Pulse 48.
12 10. Pulse 60. Clonic convulsions.
12 15. Ventricle stopped in systole, firmly contracted in its greater part, with a pouch-like dilatation of a small portion. Auricles still contracting.
12 27. Ventricle firmly contracted. Still partial contraction of auricles. Respiration and slight convulsive movements continue.
12 50. Removed from frog-board. The ventricle is not so firmly contracted. Still respiring and occasionally convulsed.
1 0 P.M. Ventricle relaxed. Slight movements of it have recommenced. 1·4 cubic centim. alcoholic solution again injected.
1 7. Ventricle again firmly contracted. No respiration. Slight reflex movement.
1 30. Died with heart in same condition.

Experiment XXX. May 10.– The heart of a frog was exposed, and a little extract of casca placed on in. Pulse 34 per minute.

It had no apparent action.

A watery solution of casca was then poured into the thorax. The pulse became slower,=24 per minute.

The ventricle then expanded irregularly; the diastole at the base being later than that at the apex.

Then the distention became imperfect, the ventricle seeming wrinkled.

The heart then stopped in systole, having two pin-point dilated pouches on it.

These experiments show that a very weak solution of casca applied to a frog's heart, when removed from the body, slows its pulsations, while, after the application of a stronger solution, the pulsations become slow, then the systolic contraction ceases to take place instantaneously over the whole surface of the ventricle; lastly the heart stands still in systole.

When the heart of a frog is exposed, but not removed from the body, and a solution of casca is injected beneath the skin, the heart's action is slowed, and is eventually stopped in systole; previous to its stopping, however, pouch-like dilatations are formed; in this respect the action of casca is similar to that of digitalis and other cardiac poisons.

Experiment XXXI. April 27.—A cat was chloroformed; a canula placed in the left jugular vein and one in the trachea. Artificial respiration was commenced, and the thorax was opened. The heart was beating regularly, but it was difficult to count the pulsations. They were counted by one person as 90, by another as 180.

10 cub. centims. of a saturated watery solution of

watery extract of casca were injected into the jugular vein. No apparent effect was produced.

7 cub. centims. more were injected in the course of a few minutes. Within about a minute of the last injection the ventricle no longer contracted as a whole, but became pouched, the upper half seeming to overlap the under half so as to produce a transverse fold.

A few seconds afterwards, the lungs, which had hitherto been rosy, became white, and almost immediately the motions of all cavities of the heart completely ceased. On irritation of the ventricle no movement occurred.

Both vagi were divided, but without effect on the heart.

It was noticed that the rosy colour of the lungs returned, although the heart did not again beat. No pulsations were noticed in the pulmonary vessels. The heart was perfectly firm, and seemed to be in systole; but on tying a ligature round the base so as to include the large vessels, it contracted to about one third of its former size.

The action of casca on the mammalian heart is seen from this experiment to be similar to its action on the heart of the frog.

Action on Secretion of Urine.

The action of the drug on the secretion of urine is seen to be very marked and characteristic, and the dependence of the secretion on the blood-pressure is well shown.

Thus the average rate of urine secreted before administration of casca being 5 minims in 10 minutes, an increase of 50 millims. in the blood-pressure caused by the drug brought the rate of secretion of urine up to 25 minims. When the action of the drug was further pushed there was first decrease and then total suppression of urine, the blood-pressure at the time of suppression being 200 millims. of mercury.

Subsequently as the blood-pressure fell the secretion of urine recommenced.

The physiological explanation of these successive phenomena appears to be that the primary increase of blood-pressure produces arterial fluxion to the kidney; but that if the action of the drug is pushed, the renal vessels become contracted so as to prevent the blood reaching the kidneys, notwithstanding the high pressure in the arterial system. It is worth notice that the urine collected after the secretion had recommenced did not contain albumen.

In this respect the result of this experiment differs from those obtained by Mr. Power and one of us in our experiments on the action of digitalis; it coincides, however, with those experiments in its general results.

Action on the Pupil and Lacrymal Gland.

In order to see if the drug exerted any local action on either of these organs, we placed some drops of strong watery solution of casca in the eye of a cat, but with purely negative results.

Effects on the Nervous System.

The drug seems to have no effect upon the nervous system.

CURVATURES OF THE SPINE TREATED BY SUSPENSION AND THE PLASTER OF PARIS JACKET.

By LAMBERT H. ORMSBY, M.D., F.R.C.S.,

Surgeon to the Meath Hospital and co. Dublin Infirmary, and to the National Orthopædic Hospital of Ireland.

(*Continued from page 58.*)

Having given a brief *resumé* of this mode of treatment in the first part of this paper, I shall now consider:—

1. *Cases where the treatment was eminently useful.*

Those who are at all conversant with spinal curvature will find that the two common varieties are: 1. Pott's angular curvature. 2. Lateral or rotatory lateral curvature; the varieties anterior and posterior occurring in a few isolated cases. From this I may fairly state that the majority of curvatures we will be called on to treat will be either lateral or Pott's.

In the early stages of either form I believe the method by suspension is an excellent plan of treatment, this suspension to be practised every day for five or ten minutes under the careful supervision of the attending surgeon. In both cases the super-incumbent weight of the head and shoulders is thus taken off the spine, the weight of the lower limbs tends to keep the body perfectly erect and extended, and this practice continued every day for some weeks tends to strengthen and bring into action the debilitated spinal muscles. In this way, after some little time, a gradual improvement will be apparent to the surgeon and friends, as well as to the patients themselves who will frequently inform you they are much stronger and able to undergo fatigue much better.

I am greatly in favour at the present time of this form of exercise, viz., suspension alone, without having recourse to the plaster jacket. The former plan can easily be practised in the private study of the medical attendant; the treatment may appear long and tedious, but in a number of cases I have treated in my study by this method in cases of lateral curvature, I can truthfully say the improvement was most marked, which I doubt very much any other treatment would effect in the same given time. When patients live at a distance and do not find it convenient to visit me so constantly after they have practised some time under my supervision, I recommend them to get the block and pulley, with the cervical collar and arm straps complete, fixed to a hook in the ceiling at their own homes, in order that they may practise self-suspension themselves. In slight cases of lateral and angular distortion, seen plainly when the patient stands on the ground, on suspension the curvature completely disappears; this will be quite apparent to anyone trying the experiment.

And if I am not greatly mistaken, the value of this treatment is mainly due to suspension, and not to the plaster of Paris, which has its disadvantages, as before mentioned. However, I am ready to admit that in lateral curvature the immovable plaster of Paris corset prevents the distortion resuming its abnormal position when the patient ceases to be suspended. Patients in summer weather complain of the heat, and the uncleanly habits it induces. If the surgeon had time in hospital practice, I think the jacket ought to be removed, and immediately re-applied after a good ablution of the back and chest at the end of every three weeks, so as to ensure moderate success in the treatment. The following case is a good example of the first class:—

Miss A., æt. 13, a young lady, residing in the north of Ireland (kindly sent to me by my friend and colleague Mr. Porter) suffering from right lateral curvature.

History.—The mother states that the girl was always healthy till some three years ago, when she got a fall, and she noticed one shoulder getting gradually raised (left), and the other gradually depressed, and by degrees the deformity appeared to be getting worse.

On examination of the spine I found a lateral curvature commencing from about the first dorsal and ending about tenth dorsal vertebra, the convexity looking to right shoulder, the concavity to the raised left shoulder. Two compensatory or secondary curvatures were apparent, one above, and the other below the great curve. I may mention here, that the examination of the spine whether, male or female, should be conducted in the most careful manner, and that all garments should be removed. A Catholic clergyman, suffering from slight lateral curvature, consulted me a short time ago, and informed me that he had been previously examined, with his coat and waistcoat on, by a leading surgeon, who, it is needless to say, failed to find any distortion, although it was quite apparent when the coat and shirt were removed. On detecting lateral curvature in this young lady, I suggested the suspension plan for a month, at the end of that time I

applied a plaster of Paris jacket, and two days afterwards I applied the suspension again with the jacket on, and I kept on doing this three times a week, for ten minutes each time, for a month; I then removed the plaster jacket and put on another, keeping it on for the same time. At the end of the fifth jacket, the treatment having continued for the space of five months, the young lady was allowed to return home, the improvement was nearly complete, the shoulders were perfectly even, and without very great observation it would be difficult to notice that anything had been ever wrong with her spine. The foregoing is a typical case of a number I have treated like this in hospital practice.

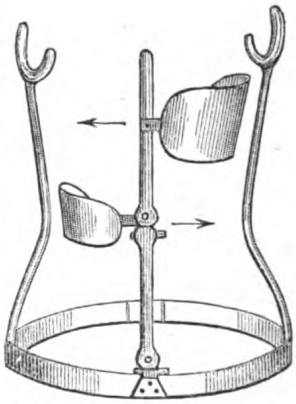
2. *Cases where the Treatment was partially useful.*—Such a result in patients suffering from more advanced spinal curvature is all that we can expect to obtain in the majority of cases, and even this is something, for many persons merely come for treatment, not that they expect complete cure, as they say, but to prevent the deformity getting worse. The following case is typical of this class:—

Miss M., æt. 17, a young lady, residing in the co. Dublin (kindly sent to me by my friend Dr. W. J. Hepburn), suffering from Pott's angular curvature, which had been coming on since the young lady was four years old, and which was supposed by the parents to have been the result of a fall. Treatment (which consisted in the wearing of leather corsets) was immediately adopted at the time, and carried out more or less up to the beginning of this year. When I saw her for the first time, she appeared very stunted in growth, complained of great difficulty of breathing, chest very prominent, or what is termed *pigeon-breasted*. The curvature extended from the first dorsal to about the fourth lumbar vertebra, the most prominent point being about the spine of the sixth dorsal vertebra, which represented a very good example of the angularity that exists in an extreme case of Pott's curvature. The girl's health was not the best, she said she had not energy for the slightest exertion. She never had psoas abscess. Head and neck appeared buried in the thorax, and the chin rested on the upper part of the sternum, the dorsal muscles at each side of spine were flabby and ill-developed. Such was the state of the young lady when I began treatment. She visited me three times a week, and I placed her in the suspension apparatus (which had been erected in my study for the convenience of patients) for five to ten minutes on each occasion. At first she complained of the strain, but afterwards became accustomed to it, and could endure being suspended for a much longer period. After carrying out this practice for about three months, I then decided to put her up in the plaster of Paris jacket, which I did on one Saturday. However, on the following Monday she returned to me, complaining of great uneasiness, and said she would not wear the case another hour. I therefore had to remove it, and it perhaps was as well I did, for even in so short a time there was evidence of great pressure on the prominent bony points, which would have formed extensive pressure sores in the course of a very few hours. She would not allow another plaster of Paris jacket to be applied, and said she would be quite satisfied with the suspension alone. This line of treatment was accordingly continued for three months more, and the young lady's condition improved very much in the time, the dorsal muscles developed, she could hold herself up much better, the chin could be kept raised from off the sternum, and she could take long walks, which she could not do for years. In a letter I received from her mother some weeks ago, the following observation occurs: "The improvement is so great that it has quite exceeded our expectations." I recommended her to continue the suspension, as she purchased Sayre's tripod and apparatus, in order to carry out daily the plan of treatment at her own home.

3. *Cases where the Treatment was useless.*—I have, as a matter of course, met with many cases where I have been obliged after a certain time to give up this treatment—sometimes because I found no improvement whatever, and on other occasions because I found the exercise and strain of suspension had a tendency to produce active disease, or else to set up active inflammation afresh in the bodies of vertebræ previously diseased. In cases where there is actual disease going on in the bodies of the vertebræ I would consider this treatment highly inadmissible. Also in cases of psoas abscess the treatment would not be useful. When the patient has reached 25 or 30 one could hardly expect a great improvement, for in most cases we find the disease commences as a low form of inflammation affecting the anterior portion of the bodies of a number of vertebræ and contiguous inter-vertebral substances, the bodies are softened, and break down anteriorly, causing the spines to divaricate posteriorly, and in so doing produce the angularity. The disease at this stage may advance, and is soon followed by psoas or lumbar abscess, which opens and discharges, and the patient finally sinks with hectic fever and exhaustion. In other cases, however, the disease may have been very active, and, perhaps, has reached a considerable extent, when it suddenly subsides, bony fusion of the bodies occurs, all irritation ceases, and a spontaneous cure takes place as regards the irritation and inflammation, but the patient is subject to angular curvature for the rest of his life. To meddle with this kind of case, I think, would be bad practice. However, you will be asked, What are you to do in such a case? The patient is getting worse. To prevent this I would then recommend a proper mechanical spinal support.

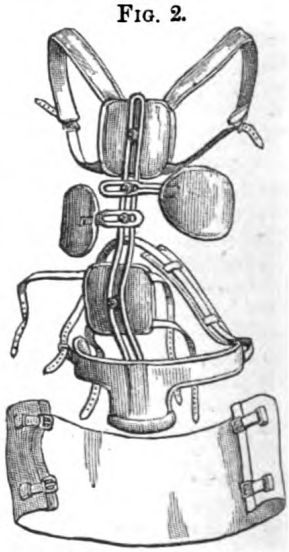
The following case is a good example of cases where I have found the plaster of Paris jacket useless. Charles M——, æt. 10, living in Dublin (kindly sent to me by my friend and colleague Mr. Smyly). This boy was suffering from extreme angular curvature of very long standing, resulting, as the parents said, from a fall down stairs. I placed him in the suspension apparatus, which he bore badly at first. I, however, put five plaster of Paris jackets on, keeping each on for five weeks, and at the end of six months I could not see any improvement in the case. I therefore decided not to apply that line of treatment any longer, and I recommended a spinal support—not that I looked for a cure, but merely to prevent the boy getting worse. Now, as regards the spinal supports in use, I find that few clearly understand the form, the time, and the mode of application of such supports, leaving the matter in

Fig. 1.



Spinal Support with Crutch Handles.

Fig. 2.



Spinal Support, correct in principle, used by Author.

detail to instrument makers. Fig. 1 depicts the ordinary support in general use, with crutch handles, &c., in which no provision is made for the gradual improvement, or the development, it may be, in a growing child. The crutch handles have a tendency to raise the shoulders up, cause the chest to fall in, and thereby induce further debility.

The principle and application of this form of support is, in my opinion, perfectly erroneous. If supports must be worn, Fig. 2 represents the proper form, which is adapted for the lateral or angular form of curvature. The plates are made to slide, and there are no crutch handles attached; the shoulders are therefore free, and by their weight are drawn downwards and backwards; the chest, by this means, has a better chance of improving its form; the two lateral supports also slide in two directions. It is easily applied, and is not at all irksome to the patient; the band is buckled round the body, and keeps the whole appliance in perfect apposition. This apparatus costs from £2 15s. to £3.

Mr. Chance, of the City Orthopædic Hospital, Hatton Garden, London, is strongly in favour of this form of support, which can be adapted, with slight modifications, to all varieties of curvature, and, in his extensive practice, he finds far better effects resulting from its use than from any other kind of support, besides giving ease and comfort to the wearer.

HYDROPATHY.

By E. MARLETT BODDY, F.R.C.S., F.S.S., Etc.

(*Continued from page* 82.)

In cases of nervous irritability, nervous debility, paralysis-agitans, locomotor-ataxia, paraplegia, hemiplegia, and other diseases devolving upon some lesion of the spinal cord or brain, hydropathy offers many great and peculiar advantages; for cold water applications to the head and back does much in delaying the advances of nervous diseases, and they counteract the disorganisation which is gradually undermining the functions of the spinal cord. As an adjunct to this mode of treatment, the application of one of Pulvermacher's chain-bands is of great efficacy, for both seem to stimulate, when so combined, to a greater degree than when resorted to separately, and especially when persevered in.

I shall not enumerate *ad seriatim* the many varieties of nervous complaints (I shall leave that to the "cymini sectores"), for they are all of the most obscure nature, and as a rule arise from some lesion of the nervous system very difficult to diagnose, very difficult to treat, and very unsatisfactory in the end; for such patients seldom recover, being altogether unamenable to treatment; the only method which seems to keep in check all nervous complaints is cold applications to the spine, and galvanising the same, and even then the chances of cure are very remote and uncertain.

In spinal meningitis there is more likelihood of a successful termination of the case from hydropathic treatment than from any other method, but all lesions of the spinal cord, whether produced by injury or are the result of disease, are unhappily remediless. These remarks will also apply to that disease popularly called the "spinal complaint," but which more often than otherwise depends upon some weakness of the vertebræ, or the ligaments which hold the vertebral column together, rather than upon any disorganisation of the spinal cord. Complete rest of the back, combined with frequent applications of cold to the same, is the only treatment which is of any benefit.

In some cases, applying a cold wet rough cloth after it has been well wrung out, and rubbing with a steady friction up and down the back as long as the patient is able to bear it, will do much towards imparting an increased vitality to this important part of the human frame.

I shall now proceed to discuss the superior advantages we derive from cold water in certain diseases and injuries to the eye, and its unrivalled antiphlogistic properties in wounds, whether incised, punctured, contused, or lacerated.

I do not intend to contrast the merits of cold water with other agents which are considered to be equally antiphlogistic in their operations, but merely to confine myself to some general practical observations, and which are thoroughly based upon my own experience; and I shall endeavour to be as concise and succinct as is consistent with the importance of my subject; neither do I intend to assert that the cold water treatment of wounds is equal, or superior to the antiseptic method; for who can essay to destroy those germs which are disseminated so widely and rapidly about us? Vain is the hand of man against such minute destruetive organisms, for if they are floating unrestrainedly in the atmosphere, ready without the slightest warning to scatter the seeds of disease and death broadcast, so must they be present in a fluid absolutely necessary to life; and if so, then is the hydropathic treatment of disease both medically and surgically a complete fallacy, then the ingestion of cold water even in health is fraught with manifold dangers, and we drink the germs of disease, laying up for ourselves some future calamity, and which may at any moment stretch us on the bed of sickness—of such fatality are the germs of disease; when they will cease developing it is difficult to say.

The diseases and injuries to the eye to which I shall now advert will be those which are commonly met with; those requiring operative treatment do not come within the range of my subject.

The only functional disorders of the eye amenable to hydropathic treatment are those appertaining to the retina and optic nerve, necessarily excluding those obscure lesions observable by the ophthalmoscope, for any organic disease of the retina is not very easily overcome, and if any disorganisation is going on in that part of the eye it generally ends in vision becoming permanently impaired. When the retina is strained through excessive use, or from looking at minute objects, or when it is secondarily affected through some functional disturbance of the brain, we may with great advantage advise the patient to keep the head as cool as he can, and to apply cold water to it every morning, and as many times during the day as possible, and at the same time to put his face into a basin of cold water, and to open and shut his eyes in it; this will cause him some discomfort at first, but as the eyes gain strength by becoming inured to it, he will be able to do so with greater facility, and finally he will find it of such benefit that he will not willingly refrain from it.

Why are cold applications to the head and front part of the eye so beneficial when the disease, or rather the weakness, is situated at the back part of that organ? The reasons are obvious and easily comprehensible, if we take into consideration what I have previously stated regarding the condition of the brain when any lesion is there present; the arteria centralis retinæ is over-dilated, in order to supply blood to the retina, and the accompanying vein is congested, consequent upon its weakened condition; this state of the retina is caused by its increase of work, and if this morbid condition lasts too long, the sight gradually decays. In order therefore to counteract this over dilatation of the blood-vessels we apply cold to the head and eyes, so that we may promote their constriction and strengthen the already weakened retina; the patientat the same time must abstain from using his eyes, sit with his back to the light, never sit under gas, and avoid gazing at near objects, and never have the glare of a lamp in front of him.

In any injury of the eye-ball or eye-lids, hydropathy is by far the best treatment to pursue, for it tends to keep down the inflammation which is always produced by an injury, and it also accelerates the absorption of blood should any hæmorrhage take place in the anterior and posterior chambers of the eye; extreme quiet, of course, should be imposed, for any movement of the eye-ball or of its appendages retards recovery. The eye should be closed, and a cold wet rag constantly applied. By this simple method of treatment the organ has a greater chance of recuperating itself and overcoming the effects of the wound. For inflammation arising from injury, the treatment most efficacious is the application of cold; bu in inflammation which is the result of disease, hot appli

cations are advisable, and in all wounds and diseases of the eye this is a method of treatment which may be thoroughly depended on.

The following hydropathic cure of a severe wound of the eye is unique, not only regarding the peculiarity of the injury, but the surprising rapidity with which the organ regained its power of vision. A middle-aged woman on suddenly getting out of bed came into violent contact with the gas burner, which projected at right angles from the pipe which hung from the centre of the ceiling, causing it to penetrate the external canthus of the right eye with great force, so that she was with some difficulty extricated from her painful and perilous position. On seeing the woman two days after the accident, I found her in a high state of fever, and complaining of an excruciating pain in both eyes, and especially in the injured one. On removing the hot poultice I found the eye-lids of both eyes tremendously swollen, red, and exquisitely tender, the right much more so than the left, and from which was oozing some thick viscid pus streaked with blood, somewhat similar to what we see in a bad case of purulent ophthalmia, the whole face being at the same time swollen and covered with an erysipelatous blush.

I at once forbad the application of hot poultices, and immediately soaked a handkerchief in cold water and laid it across the forehead and eyelids, and ordered her to keep it constantly applied; my injunctions were strictly carried out—for this simple reason, the woman soon found that cold water gave her more relief than the hot poultices, &c.

At the end of three weeks all the inflammation had disappeared, the eyelids resumed their normal size, matter ceased to ooze from the injured eye, there was no pain in either organ, and the woman was able to open both eyes with comparative ease when the room was a little darkened, and her sight was unimpaired.

On making an examination of the injured organ I found that the sclerotic had been much bruised and was very painful on pressure, and there was a slight cloudiness on the outer edge of the cornea, but it did not interfere with vision; the movement of the eye-ball was complete, showing that the external rectus and the external oblique muscles were fortunately uninjured. The eye of course was weak, and tears would fall plentifully if it was exposed to a sudden glare of light.

This simple treatment, considering the peculiarity and severity of the injury, and the great importance of the organ injured, combined with its extreme delicacy of structure, would have been regarded by a great many as altogether inadequate to the exigencies of the case, and even if adopted would most likely not have been persevered in, especially when pus had once made its appearance; but it shows what can be achieved by cold water, how, even when pus has formed, its application tends to prevent an increase, and with what celerity a dangerous injury to an important organ can be cured, when such treatment is carried out to the letter.

In epiphora (overflow of tears), when it does not depend upon a blocking up of the lachrymal sac or duct, the same treatment is equally advantageous.

In ptosis (dropping of the eyelid), when not arising from syphilis, cold applications are beneficial, but when once the eyelid is so affected it is generally permanent, for it points to some severe lesion of the brain and indicates mischief of a serious nature.

In weakness of the eye depending upon scrofula, we must altogether dispense with cold water, and use hot applications instead. I mention this in order to show that scrofula, when it shows itself in this most important organ, must be treated differently than when it shows its disfiguring features in other parts; but then, in this semi-diseased state of the constitution, judicious medical treatment combined with nourishing diet is what is really necessary.

Strabismus (squinting) is also benefited by opening and shutting the eyes in cold water, for it tends to strengthen the muscles. This treatment is most advantageous when the disfigurement is slight; however, it is good in all cases of weakness of this organ and its various appendages, when unaccompanied by any external irritation.

There are other diseases of the eye, of which my readers are doubtless aware, beside those mentioned above, but I have only enumerated those morbid conditions which are amenable to hydropathic treatment.

I must here make a few remarks upon epistaxis (bleeding from the nose), which so often occurs to young and old alike. In the majority of cases it is a natural relief of the vessels of the brain, and when such is its origin, it is to be considered beneficial rather than otherwise, for it often saves the person from a fit of apoplexy, and, consequently, it should only be stopped when the bleeding is in excess, which only occurs when there is any lesion of the heart or lungs. Cold water to the head, or ice to the bridge of the nose, is generally sufficient to stop the hæmorrhage when it is in excess; if this fails, which is very seldom, plugging the anterior and posterior nares with lint soaked in strong perchloride of iron is sufficient for the purpose.

In this treatise I have purposely avoided all reference to those hydropathic extravagances and absurdities, such as wrapping the patient in a cold wet sheet, putting the feet into cold water, &c., which have done so much to prejudice the minds of many against the cold water treatment, so that they have regarded it as an unpractical theory, and have accordingly given it an indifferent and partial consideration; but I think I have clearly demonstrated to all unprejudiced minds, that apart from its multigenerousabuses, which have disfigured and deformed its extreme simplicity, that cold water is a thoroughly reliable agent in the treatment of disease.

I have also abstained from indulging in "all precarious *conjecture*" and "hypothesis dressed up in the form of *certainty* and *demonstration*," for there is not the slightest doubt but that "there will not be any great and considerable advances made in the art of healing till all hypothesis and mechanical reasoning is out of vogue, and till men are come about again to the ancient method of pure experiment and the common obvious reasoning entirely from thence."

Special Correspondence.

THE INTERNATIONAL CONGRESS OF HYGIENE.

[From our Special Correspondent].

Paris,
Aug. 2nd, 1878.

The Congress was inaugurated on the 1st by M. Teisserenc de Bort, Minister of Agriculture and Commerce, in the grand hall of the Trocadéro Palace. The room was crowded by the home and foreign associates. On the right of the Minister M. Bouchardat, Hon. President of the Congress; and on the left were Professor Gubler, President, MM. Emile Trélat, Durand-Claye Lionville, Lacassagne Napias, Martin, and other members of the Committee.

The Minister declared the Congress open. He thanked the Committee, and welcomed the home and foreign associates to this re-union.

This was acknowledged by Professor Bouchardat.

After the reading of a letter from General Renaud, Minister of War for Belgium, Dr. Lory-Marsh read, in the name of the Duke of Northumberland, President, the following

ADDRESS OF THE SANITARY INSTITUTE OF GREAT BRITAIN AND IRELAND.

"The President, Vice-President, and Council of the Sanitary Institute of Great Britain feel greatly honoured by the invitation to take part in the Congrès International d'Hygiène in Paris during the month of August, 1878.

"The President, Vice-Presidents, and Council, desire to offer their congratulations to the President and Committee of Organisation of the Congrès International d'Hygiène, for the distinguished services they have conferred upon hygiene, by

availing themselves of the auspicious occasion of the International Exposition in Paris, to invite to their capital the most distinguished and earnest workers in the cause of Public Health of All Nations.

"The meeting of an assembly so distinguished, to discuss subjects of such vital interest to the well-being of mankind, cannot fail to result in the advancement of that science which has for its object the prolongation of human life and the well-being of the whole human race."

He was followed by Professor Gubler, who, in a speech characterised by eloquence, thanked the foreign members for their attendance. He drew a picture of the conquests of hygiene in the prophylaxis of diseases, and insisted on the social aspects of the science of hygiene; to assure the present and provide for the future, such seemed the *rôle* of re-unions of this kind.

After M. Lionville, General Secretary, had read the programme, and announced that the number of associates were 1,018, Professor Crocq, Senator of Brussels, addressed the meeting. He drew a brilliant parallel between the misfortunes of war and the benefits of sanitary science.

In the absence of M. Palaciano, of Naples, Professor Pacchianti, of Turin, spoke, as a delegate from Italy, of the advantages obtained in Turin by the adoption of hygienic precautions.

The sitting closed at a quarter to six.

The Palace of the Tuilleries was the place of meeting for the 2nd August.

To facilitate the transaction of business there are three sections, officered as follows :—

Section I.—President — MM. Thulie, Felix, Roumania. Vice-Presidents—Dr. Drysdale, England, M. Ciure, Roumania. Secretaries—MM. A. Robin, Fabre.

Section II.—Presidents—MM. Giraud-Teulon, Velasco, Spain. Vice-Presidents—Dr. Lory-Marsh, England, M. Strohm, Russia. Secretaries—MM. Drouineau, Chassagne.

Section III.—Presidents — MM. Léon Colin, Masana Meada, Japan. Vice-Presidents—MM. Boeckstal, Belgium, Polychronie, Roumania. Secretaries — MM. Boulanger, Manouriez.

The following papers were in the programme :—

Section I.—Dr. Roth (London), "On the Popular Teaching of Hygiene." Dr. Groof (Buda-Pesth, "On the Organisation of Public Hygiene in Hungary." Dr. Drysdale (London), "On the too rapid Increase of Population in England and France." Dr. Kuborn (Belgium), "On Public Hygiene in Belgium."

Section II.—Dr. Javal (Paris), "The Hygiene of Sight in Schools." Dr. Goyan (Paris), "The Influence of Tobacco on the Development of the Organs and Functions."

Section III.—M. Bouley, a member of the Institute of France, and a well-known authority on hydrophobia, spoke on the prophylaxis of rabies, and M. Bonjean also read a paper on the same subject.

I shall allude again to these communications.

Though 500 foreign associates have given in their names as adherents, England is not well represented, and, as Mr. Smith said in his letter to the *Daily News* before the meeting, it is a matter of some regret that we have not a larger contingent here. Before the 10th our number will be increased. The voluminous reports already issued by the committee are indices of the energy and ability of the organisers of this congress. They will be found most useful by medical officers of health. All the proceedings of the Congress will be published in full, and may be obtained on payment of eighteen francs, so that those who have not been able personally to attend will have advantage of being able to read full reports of the discussion.

Science can only advance by collecting the experiences, not only of our own country, but of the world, for science has no limit or nationality. Hygiene has an universal interest and application. It is but yet in its infancy. The triumphs of the past and the present should stimulate us to further exertions, and hence we must wish success to all reunion and congresses having such aims in view as the diminution of suffering and death and the promotion of the welfare of the human race.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 7, 1878.

THE PROSPECTS OF MEDICAL REFORM.

WE may with most authority describe the chances of the passing of the Medical Bill by quoting the words of Lord George Hamilton, speaking in the House of Commons last week.

In reply to Dr. Playfair and Mr. Mills,

Lord G. HAMILTON said—In consequence of the opposition by certain members to this Bill its chances of becoming law this year daily diminish. My amendments were put upon the notice paper to make clear to the opponents of the Bill the course we intended to take, in the hope that their opposition would be then removed, and until I know the effect of my amendments I am unable to give a definite answer as to the fate of the Bill.

We understand that the Government feels that, at this period of the session, there is no hope of passing the measure if the second reading is opposed, and has, therefore, deferred taking that stage of the Bill from day to day, in the hope that consultations and concessions may remove the opposition of certain parties. If this be so, it may be taken for granted that we shall have no medical reform this year, for it is quite certain that the Scotch Bodies and the Queen's University will *per fas aut nefas* resist progress, and no amount of persuasion or concession will remove their antagonism. We are, however, not without a relic of hope that the Government may yet find itself strong enough to get the Bill through in the teeth of the North British and South Irish opposition, and we are quite well aware that the Duke of Richmond and Lord George Hamilton will avail themselves of any and every chance to effect this purpose.

In preparation for the contest, and that the Govern-

ment programme may be made public, Lord George Hamilton has "tabled" his amendments. They are as follows :—

1. To extend the time for the operation of the Bill for twelve months, so that the Irish and Scotch Bodies may have leisure to concoct their schemes of Conjoint Examination, and that the Medical Council may have time to revise those schemes.

2. To ensure that a degree or diploma (in addition to a Conjoint Examination Certificate) shall be necessary for registration, and at the same time to provide that women or other persons who are refused such diploma shall be registrable without it.

This is infinitely the most important proposal of the Government, for it is by it that the maintenance of the Licensing Bodies is made compatible with absolute freedom of entry to medical practice. It is as follows :—

In clause 4, p. 2, line 22 of the Bill, at beginning of clause, to insert, "A person who has obtained a qualifying certificate under this Act from a medical board for any part of the United Kingdom shall, for the purpose of registration, obtain, except in case of such refusal as hereinafter mentioned, some medical diploma or diplomas, whether degree, membership, associateship, or other, from one or more of the medical authorities for the said part of the United Kingdom :

Any such person may apply to one or more of the medical corporations for the said part of the United Kingdom for such diploma or diplomas (each of which is in this Act referred to as a registration diploma), and if refused such diploma or diplomas, either without any ground being assigned or on the ground of, sex or on any ground except non-compliance with a scheme under this Act, or on some ground which would justify the erasure of the name of such applicant from the register, shall be entitled to be registered in the medical register without obtaining a registration diploma :

Nothing in this section shall oblige any corporation to grant a registration diploma to any applicant as aforesaid, and a person obtaining a registration diploma from a medical corporation shall not, except so far as the medical corporation otherwise in their discretion provide, be entitled to any share in the government, management, or proceedings of that corporation, or to any rights or privileges in connection with that corporation."

The sense of this clause is obvious. If a woman desires to become a medical practitioner, she passes the Conjoint Examination, and then addresses to one of the co-operating licensing bodies her demand for its diploma. If she be refused she will suffer no loss, because she can at once register without it, and will not be obliged to pay for the license in question ; if the diploma be granted to her, she pays for it and enjoys all the privileges attaching to it.

Had we not been taught by experience how insatiable are the ladies in respect to their rights of citizenship, we should be quite confident that this clause will satisfy their pretensions. Remembering how unbending they have hitherto proved themselves, we must await their gracious decision before we venture to calculate upon the passing of the Bill.

The difficulty of subjecting them to an examination exactly equivalent to that imposed upon male students, is proposed to be got over by the adoption of the following amendment :—

Clause 13, page 8, line 2, leave out from "and" to end of line 4, and insert, "may make such distinctions (if any) as may be judged proper between the cases of men and women, so however that the examinations of men and women be in all general respects equal."

The remainder of the amendments deal with matters of detail, and are of secondary importance ; and it is provided that the form of the Medical Register shall be altered so that the "Registration Diplomas," or legal qualifications to practice, shall appear in one column, and the "higher diplomas" in another.

We understand that the Council of the Irish College of Surgeons has—upon report of their Parliamentary Committee—unanimously approved of these amendments and has expressed to the Lord President its opinion that th Bill, as so amended, ought to satisfy every reasonable requirement of the profession. It will be greatly to be regretted if the scheme of medical reform which is embodied in it—a scheme well thought out, generally approved and thoroughly matured—falls to the ground in consequence of obstruction by a small minority of persons whose interest lies in the continuance of old abuses, and by a few troublesome women whose vanity is hypertrophied by the undue importance which has been given to their demands.

Since the foregoing was in type, the Government has announced its intention *not to proceed with the Bill* this session.

THE CORONER'S MEDICAL WITNESSES IN DUBLIN.

It will be in the recollection of our readers that, when we last reported upon this subject, the Irish Medical Association had brought under the notice of the authorities of both the provincial and metropolitan police in Ireland, the judgment obtained by the Association from the Court of Queen's Bench in the case of Jacob *v.* Finlay, to the effect that the coroner was in all cases bound, as set down by the Act, to employ a "medical practitioner in actual practice at or near the place where the death happened." The request preferred by the Association was that the police authorities should "issue instructions to the police that they shall, when giving the usual notice to the coroners, inform them of the name and address of the legally qualified medical practitioner (if any) who was in attendance upon the deceased shortly before, at, or immediately after the occurrence of death—or of a legally qualified medical practitioner in actual practice at or near the place of death, in order that such medical practitioner may be summoned to give evidence at the inquest in accordance with the provision of the law." This request was based not only upon the words of the Act above quoted, but upon the 9th and 10th Vic. cap. 37, sec. 22, which enacts "that the constable or subconstables acting in and for the place where such dead body shall be found, or such death happen, shall give, or cause to be given, immediate notice thereof to the coroner of such district, *together with such information as he or they shall have been able to obtain touching* the finding of such dead body, or *such death.*" Upon this suggestion the Inspector-General of Royal Irish Constabulary at once acted, by issuing a circular to the county inspectors, instructing the police in all cases to ascertain the name of the medical practitioner last in attendance on deceased, and to inform the coroner of the same. The Chief Commissioner of Dublin Metropolitan Police did not, however, follow this commendable example, but, on the contrary, replied regretting that he was "not in a position to take any step, as

the law gives the police no discretion in the matter." He proceeded to observe, that "in Dublin the established practice appears to be to have a medical man specially set apart to act as medical witness at inquests," an arrangement which, "it is understood, has been approved by the proper local authority."

We have to remark, as to this reply, that it furnishes us with cogent evidence, not only of the entire ignorance on the part of the Dublin Police Department, of the law affecting its own duties but also of the incapacity or indisposition of the police officers to read or understand an official letter. It might reasonably have been expected that the Chief Commissioner would know better than the Irish Medical Association the duties of the police in reference to inquests; but, as he did not display this much interest in the duties for which he is paid, it was certainly not too much to expect that he should, by reading the letter addressed to him, satisfy himself that the "established practice" had been pronounced illegal by the Court of Queen's Bench, and that no "proper local authority" had any control whatever in the matter, or could, by its approval, make a breach of the law legal or regular. It appears likely, from the nature of the correspondence, that the Chief Commissioner relieved himself of the trouble of understanding the subject by asking the opinion of the Coroner, or the Coroner's salaried medical witness, or the Corporation, or of some other of the parties against whom the Court had pronounced judgment, and that, acting on the advice of the defendant parties, he had determined to set the authority of the police department against that of the Judges, and to sustain the system which the Court had condemned.

It is unnecessary for us to pursue further the lengthened correspondence which has already appeared in our columns. It is enough to say that the Irish Medical Association was not deterred by the rebuff which the Chief Commissioner thought himself authorised to administer, but returned to the charge, and insisted on instructing that gentleman in his duties. As might reasonably have been expected, the Commissioner refused to hear or to learn, and it became necessary for the Association to appeal to the Lord Lieutenant; and we are gratified to state that that appeal was successful, and that the Chief Commissioner has found it necessary to unbend so far as to carry out the suggestions which had been offered to him, and which he had before not thought worthy of consideration.

The Council of the Irish Medical Association has received the following communication:—

Irish Office, London, 2nd July, 1878.

Sir,—With reference to your letter of the 17th May last, relative to the information to be given to coroners by the police in cases of inquests, and as to the duty of coroners with regard to medical witnesses, I am directed by the Lords Justices to acquaint you for the information of the Council of the Irish Medical Association, that their Excellencies are advised that the only duty devolving upon the police in connection with giving information to the coroner is to give him notice of the death, together with such information as can be obtained touching the finding of the body, or the death, and that it is no part of the duty of the police to furnish to the coroner, when reporting the death, the name of a medical practitioner in actual practice at or near the place where the death occurred.

Their Excellencies are further advised that the duty of ascertaining who is the proper medical witness to summon to an inquest, is imposed on the coroner by the 33rd section of the 9 and 10 Victoria, cap. 37; but also that if the deceased had been attended immediately before his death by a medical man, it is reasonable that the police should give the name of such practitioner to the coroner, as this may lead to important information touching the death.

Their Excellencies understand from the Chief Commissioner of Police that instructions to the above effect, and similar to those given to the Royal Irish Constabulary, have been in the possession of the Dublin Metropolitan Police for a long time past, and have been acted upon in every practical case, but that the attention of the force will be again directed to them.

I am, Sir,
Your obedient servant,
James Lowther.

The gist of this letter is, that the Goverment is advised that it is the duty of the coroner, not of the police, to ascertain who is the "medical practitioner in actual practice at or near the place of death," but that it is the duty of the police to ascertain and report to the coroner the name of the last medical attendant, that being a part of the "information touching death" which it is their business to obtain.

This seems to us a very just interpretation both of the spirit and letter of the law, and it concedes all that the Irish Medical Association could reasonably, or did, ask for, and all that the Chief Commissioner refused.

We venture to assure their Excellencies that they are misinformed as to the custom hitherto prevailing in Dublin in this matter. It cannot be true that the police acted on the desired instructions (if they ever had such instructions), "in every practical case," because in the case of Jacob *v.* Finlay, the coroner swore that he did summon the last medical attendant *in every case in which he had knowledge of him;* and as it appeared that he only summoned such witness to nine inquests out of 264, it is plain that the coroner had *not* the knowledge which their Excellencies conceive that the police ought to have, and had supplied. We find it difficult to understand how the Chief Commissioner reconciles his statement, that "instructions similar to those given to the Royal Irish Constabulary have been in the possession of the Dublin Police for a long time past, and have been acted on," with the fact just stated, and with the refusal conveyed, in his own letters, to give any instructions to the police. If he were aware that the police had already such orders as the Association asked for he would not—as he did—have given reasons why he should refuse to issue such orders to them.

The Irish Medical Association has achieved all it desired in the interests of the profession, and has, moreover, done good service to the public at large, *firstly*, by having made sure that the medical witness who knows all about the death shall be summoned; and, *secondly*, by having recalled to the recollection of so great a man as the Chief Commissioner the fact that there are others placed in control who are greater than he, and that he cannot be permitted to treat the reasonable representations of the medical profession as his own fancy may move him.

Notes on Current Topics.

Mr. Charles Reade and his Literary Vagaries.

Some time ago the reader's attention was drawn to an extraordinary series of letters which appeared in the *Daily Telegraph* under the heading, "The Coming Man," in which Mr. Charles Reade dilated in the most incoherent and verbose fashion on the absurdity (as he thinks) of everybody not being able to use their left hand as well as their right. The opinion we expressed on the subject appears to have been shared by other journalists; and we find the *Standard* noticing some correspondence between Mr. Reade and another gentleman which shows that the long rigmarole letters of the "novelist and play adapter" are as remarkable for their impropriety of language as they are for their eccentricities of thought. "Some time since," observes the *Standard*, "Mr. Reade was permitted to write for a contemporary some more or less fantastic nonsense, in his usual laboured and studiously eccentric style," and now, in answer to a gentleman who, in the most courteous manner possible, ventured to differ from him in opinion, Mr. Reade has used language which, to some lay readers, may appear almost inexplicable. "My privacy has been intruded on by a letter from you,"—"your intellectual superior in a matter where he is profoundly learned and you are as ignorant as dirt,"—"irrelevant truth, a deliberate lie, and a piece of imbecile twaddle"—these are only some of the very modest and polite expressions with which the apostle of ambidexterity meets the arguments of his opponents. But let not the *Standard* nor any other paper be taken by surprise. Perhaps Mr. Reade (or his friends) will find it more easy to excuse his language, than to defend his argument, on physiological grounds. We all know how great is the correlation between the mind and the body—between physical and mental impressions—and how some unnatural, uncomfortable, or unknown physical actions are apt to distort our ideas or reflections. We have heard of some writers who could not write unless sittting before a particular desk, or in a particular kind of light; and there are few who have not found how much a bad pen will interrupt or misdirect the current of their thoughts. It can therefore be easily imagined that in his enthusiasm for ambidexterity Mr. Reade may have been actually practising what he speaks—that the attempt however was too much for him—and that the habitual fatigue, awkwardness, and unnatural feeling of using his left hand reacted upon the mind and warped both his judgment and his language. Besides, who knows but that Mr. Reade may have been labouring under an attack of dyspepsia at the time he wrote those letters, or that he was a victim to the agonies of gout, and that each of those naughty words, to which the *Standard* draws attention, was but an expletive provoked by a corresponding twinge of that painful disease. At all events, this is the light in which we, as medical men and physiologists, may regard the matter, and perhaps it is about as charitable a view of the great novelist's rudeness as any other that might be taken.

The Flaw in the Adulteration Act.

We referred last week, and in preceding issues of our Journal, to a decision of the Lord Justices on an appeal case in Scotland, by which it was ruled that a prosecution could not be successful if the adulterated article had been purchased by an inspector for the purpose of analysis, because it was not "sold to the prejudice of the purchaser." We also noted that a Bill had been introduced into Parliament to remedy this flaw in the law.

At the Hampshire Sessions last week, Mr. C. D. Esdaile asked the Right Hon. G. Sclater-Booth, M.P., President of the Local Government Board, whether his attention had been directed to this decision? Mr. Sclater-Booth replied that his attention had been directed to a decision in the High Court of England, and another in the Sessions Court of Scotland, upon questions arising under the Adulteration of Foods Act, but he was hardly in a position to give a definite opinion on the subject, the papers having reached him only yesterday. So far, however, as he knew, it appeared that what Mr. Esdaile had called a decision of the High Court of Justice was in reality the arbitrary dictum of one learned judge, and until that had been appealed against it would not be right to assume that the Act of Parliament had broken down in one important particular. The Court in Scotland had come to a decision which was certainly surprising to him, and if the Courts of England should take the same view of the existing law it would probably be that an amended Act would be introduced at the joint instances either of himself or some one on his behalf and the Lord Advocate. He did not see that they were bound by the recent decision at Westminster, and he should not be disposed to put any restriction at present upon the collection of samples.

Upon this subject the *Analyst* offers the following remarks:—

> It is a remarkable and significant fact that more than half of the adulteration prosecutions are defended simply on technical quibbles. The solicitors for the defence virtually, if not in so many words, acknowledge the sophistication, and then proceed to argue as to the details in which the Act passed for the prevention of this sophistication has not been complied with. It matters little to the defendants what the quibble may be, sometimes it takes the form of an inspector not being prejudiced by the purchase, sometimes the formula of words to be repeated by the inspector is alleged not to have been duly recited, sometimes the sample after division is stated not to have been properly sealed, and sometimes *the* label has been forgotten; anyhow, the fact remains that technical objections are the favourite defence of the grocer, the druggist, and the publican.
>
> It is needless to say that all this wants altering, and that the only defences in such cases ought to be *bona fide* ones, instead of the palpable evasions of the Act in which the trade journals so much delight.
>
> We certainly do feel that it is a disgrace to English honour and English truth, that tradesmen guilty of fraud should protect themselves under such a subterfuge as this Bill seeks to remove, and we wonder that honest grocers, publicans, and druggists do not protest against needing any such subterfuge to prove their integrity.
>
> Meanwhile, a remedy is available. Let every corporation, board, or bench of magistrates in the kingdom follow the example of the Plumstead Board of Works, and direct the inspectors to use, as food or drink, or otherwise as the case may be, a portion of every sample which they purchase. This will, no doubt, be a case of fighting the adulterators with their own weapon—sharp practice—but for once this is of little moment, so long as the public who are swindled and the honest tradesmen who are undersold, are protected.

Compression of the Abdominal Aorta in Post-partum Hæmorrhage.

In the current number of the *Obstetrical Journal* Dr. M. M. Bradley, of Jarrow-on-Tyne, has an article on post-partum hæmorrhage, with notes of three cases successfully treated by compression of the abdominal aorta. Ploncquet, Saxtorph, and Chailly have relied upon this method of arresting the hæmorrhage, and Dr. Barnes says he occasionally derived advantage from it, and looks upon it as a momentary resource. Dr. Bradley claims for it the following advantages: 1. That Nature's tourniquet is always ready, and can be immediately applied. 2. It in no wise interferes with the employment of other remedies. 3. It is of all other means the one more directly under our control, and as it is practised while the patient lies on her back, we can observe the countenance, and also see that remedies of a stimulating, nutritious, and medicinal character are diligently administered. The treatment by compression of the abdominal aorta is certainly a rational one. The uterus, after delivery, has been compared to a recently amputated stump, and if compression of the main artery to the limb is the legitimate and proper means by which hæmorrhage is temporarily arrested, compression of the main artery to the uterus must, *cæteris paribus*, be a legitimate and proper means for temporarily arresting uterine hæmorrhage. For this reason alone, independently of the successful termination of Dr. Bradley's case, we would recommend the profession to occasionally adopt a plan of treatment respecting which we have at present so very little experience. We are inclined to think that further observation will show that this method of arresting uterine hæmorrhage can, as Dr. Barnes said, be only looked upon as a momentary resource. Nor can it be resorted to in all cases; for where the patient is stout and fat, or the abdominal walls tense, muscular, or distended through a flatulent or loaded state of the bowels, it may be difficult to compress the aorta sufficiently to prevent the loss of three or four ounces of blood, a loss which, small as it is, may turn the scale against the recovery of the patient. As, however, other remedies can be employed at the same time, the life of the patient need not be sacrificed to the employment of an unsuccessful remedy."

Milk, Typhoid Fever, and Diphtheria.

In consequence of an alarming outbreak of diphtheria at Surbiton the Improvement Commissioners had a special meeting on Saturday, when their medical officer said that he had inquired into 34 cases. Out of those cases, 30 persons had taken milk supplied by one dairyman, and his opinion was that the outbreak was to be attributed to the milk, but how it had become contaminated he was not then in a position to say. On the other hand, we hear that an alarming outbreak of typhoid fever has occurred at Bristol, and that the medical officer of health has traced the disease to the use of milk contaminated with typhoid germs. Between 20 and 30 families were affected, and the medical officer expects that several of the cases will prove fatal.

That the use of milk should have given rise to a severe epidemic of typhoid fever in one place, and to diphtheria in another is rather a curious circumstance; and if the above outbreak of diphtheria originated in the manner supposed, we shall have to alter the opinions generally entertained respecting the etiology of that disease. That typhoid fever may originate in and be propagated by the drinking of milk contaminated with sewage emanations has been proved beyond doubt; although it is still a disputed point whether the contagium of the disease is contained in ordinary sewage or in sewage tainted with the excreta of persons suffering from the fever. If the use of a certain supply of milk will give rise to an epidemic of fever in one place and to diphtheria in another, it must be through the sewage matters with which the milk is contaminated, containing in one case the specific germs of typhoid fever, and in the other the specific germs of diphtheria. At all events, supposing that the outbreak of diphtheria was really caused by impure milk, it is evident that either the sewage contamination must have contained the specific germs of the disease, or that the "pythogenic" theory of typhoid fever must be wrong. Water or milk infected with *ordinary* sewage emanations cannot produce both of these disorders, as they are entirely different affections. Besides, were there a common cause, we should find during these outbreaks some people attacked with the fever and some with diphtheria, which is not the case. If, therefore, the milk theory be true, either each of these diseases must be propagated by its own specific contagium finding its way into the milk, or ordinary sewage matter must be at the bottom of the disease in one case, and specific sewage matter in the other case.

London Water Supply.

Dr. Frankland's reports on the twelve monthly analyses of the waters supplied to London by metropolitan companies during the year 1877 are, on the whole, favourable. Taking the mean proportion of organic impurity in Thames water in 1868 at 1,000, the quantity of organic impurity in Thames water in 1877 was 907. The water from the Lea, delivered by the New River and East London Companies was, as usual, much better than that delivered from the Thames, its organic impurity being represented in 1877 by 596. The deep well water supplied by the Kent Company is unaffected by animal and vegetable life. If, says the Registrar-General, for purposes of comparison, the amount of organic elements found in the Kent Company's water be taken as unity, then it will be observed that, on an average, the quantities of organic matter were greatest in the water supplied from the Thames by the Southwark (4·2) and Chelsea (3·9) companies, after which stand the Grand Junction (3·6), Lambeth (3·6), and West Middlesex (3·4); then follows the East London (2·6) and New River (2·2) Companies, drawing their supply from the Lea; and the Colne Valley (1·4) and Tottenham (·5) supplies from deep wells.

Transfusion of Milk or Blood, and the Detection of Crime.

In many cases of disease, says Professor S. G. Armor, the patient often dies from failure of heart action before the local disease can run through its natural history. In

all such cases time becomes an important element of cure, and the way to get such time is to guard well the "dead point of danger," a weak and failing heart. Dr. J. S. Prout, of New York, quotes these remarks in a letter to the *New York Medical Record* on the subject of transfusion of milk, and says that shock enters largely into this tendency to death. Could time be gained this shock or collapse might pass off and life be saved. Transfusion, moreover, may aid in the detection and punishment of crime. Life might be prolonged sufficiently long to enable the victim of an assault to identify his assailant. It may also be applicable in cases of poisoning. George Eliot has already made use of this idea in her story of "The Lifted Veil," published in 1859, in which we are told of a wicked woman whose guilt was brought to light by the experiment of transfusing blood into the heart of a person just dead, who revives for an instant and denounces her.

Decrease of Fevers.

The Registrar-General has recently remarked that one of the most noteworthy features in these (mortality) returns, is the gradual reduction in the mortality from fever, which destroys so many persons in the prime of life. In 1870, the aggregate deaths from fever in seventeen of our large English towns were 5,475; these have declined year by year to about half the number, so that in 1877, they were 2,891. This affords satisfactory evidence that the sums of money which have been expended on sanitary measures during the last quarter of a century, are now beginning to be repaid with interest in the preservation of thousands of valuable lives.

Smell and Hearing in Insects.

Mr. E. L. Layard, writing from New Caledonia, to *Nature*, gives some very interesting observations on this subject. He says—

At this moment I have in my verandah a parrot, which is daily regaled with a portion of a banana. Every evening I see a dozen, or more, of the large moths trying to effect an entrance into the cage to get at the rotting fruit, *which is generally invisible* from the outside, being behind the flap of wood that serves for a door; the cage is only a rough box. I have always found bananas the best bait to attract the nightflyers, *but only when they began to rot.*

Again, how about "sembling?" Here the odour must be very subtle. A virgin female is instantly detected, while not one "gay Lothario" will visit a captive matron.

I will adduce one remarkable case in support of the smelling power. Years ago I had (while residing in the North of Ceylon) a lot of living *Achatina panthera* sent to me. I placed them in a breeding-cage, and, to secure them from rats, suspended it to the ceiling of my drawing-room. We soon noticed that every night the floor of the room was covered with glow-rooms, at which, never having seen them in that part of the island before, and they being of unusual size and brilliancy, we were much pleased.

At last it occurred to me why they came, and on placing the cage on the floor the onslaught on the contents was a convincing proof that *A. panthera* would never be naturalised at St. Pedro.

I have since mentioned the subject to Père Montrousier, the celebrated French naturalist so long resident in this colony. He detailed the following experiment that he had made. He immersed a long-snouted weevil so as to cover it, all but the tip of the antennæ, with a coating of wax. On presenting to it oil of turpentine it becam e violently excited and endeavoured to escape. Another now had the tips of its antennæ only coated with the wax, and neither turpentine nor any other strong smelling substance at all affected it. He places the faculty of the "perception of sound" equally in the antennæ.

After-Treatment of Tracheotomy Cases.

Vogt (*Cbl. f. Chir.*, 1878, p. 158; from *Deutsche Med. Wochens.*), proceeding from the fact that with the present methods of treating tracheal croup most children perish, even after operation, from continued formation of the membrane, suggests glycerin as a means of hindering the formation. It is known that when this substance is applied to the mucous membrane a profuse watery serous secretion is excited; and this is relied upon by Vogt to remove or prevent the adhesion of the false membrane. In the case of a little six-year-old girl treated in this way a cure resulted. Glycerin mixed with an equal quantity of water was inhaled, by means of an inhalation apparatus connected with the tracheal tube, every half-hour. Vogt has also used this treatment in recent cases of croup, where tracheotomy has been thought unnecessary or unadvisable. Disinfection of the original patch in the pharynx by means of chlorine or bromine water preceded the use of inhalation.

Electricity in Hydrocele.

In the *Gazeta Medica*, Dr. Macario reports two cases of hydrocele treated by a single application of an electric needle for the space of one minute. One of these cases was permanently cured; the other was only temporarily cured, the disease returning after ten months. In both instances the fluid entirely disappeared in the course of twenty-four hours, though no fluid escaped through the wound made by the introduction of the needle. Macario recommends the employment of this method in other kinds of cysts, especially for ovarian cysts, and cites three cases that have been published as cured by this means.

Liquor Bismuthi for Nasal Catarrh.

Dr. Q. C. Smith writes to the Pacific *Medical Journ.*, recommending for nasal catarrh liquor bismuthi and water, equal parts, applied one to three times a day, to nostrils, pharynx and naso-pharyngeal cavity, freely, with a spray producer. He has found this, during an experience of several months, to produce very satisfactory results. Sulpho-carbolate of zinc, in weak solution, as mentioned by other writers, he regards also as a very efficient remedy; applied in the same manner.

In the principal foreign cities last week the annual rates of mortality were—in Calcutta 33, Bombay 33, Madras 39; Paris 26; Brussels 31; Amsterdam 24, Rotterdam 22, The Hague 25; Copenhagen 21; St. Petersburg 48; Berlin 56, Hamburg 25, Dresden 23, Breslau 32, Munich 31; Vienna 27, Buda-Pesth 40; Rome 32, Turin 31, Venice 27; Alexandria 52; New York 27, Philadelphia 24. Diarrhœal diseases showed especial fatality in Berlin.

Curare in Epilepsy.

In the opinion of Kunze we possess in curare a remedy by means of which we may cure cases of epilepsy of long standing. He employs a solution of seven grains of curare in seventy-five minims of water, to which he adds two drops of hydrochloric acid. At intervals of about a week he injects beneath the skin eight drops of this solution, and in various cases in which convulsions had occurred for several years, he obtained a complete cure after eight or ten injections.

Edinburgh University.

At the graduation ceremonial on Thursday last, the degree of LL.D. was conferred on the following gentlemen:—Dr. Risdon Bennett, President of the Royal College of Physicians, London; Sir Joseph Fayrer, Honorary Physician to Her Majesty the Queen; Mr. John Richard Green, the Historian; Professor Lister, Professor of Clinical Surgery, King's College, London; and Mr. William Macdonald, Rector of the High School, Dunedin, formerly of the High School, Edinburgh.

The managers, in their anxiety to extend University College, London, seem altogether to ignore the claims of the hospital. Another wing to the College is contemplated at a cost of £50,000, whilst the staff of the hospital are allowed to struggle through their patients, who require at least double the present space, and medical students have "to play second fiddle" to those of other professions and schoolboys intended for the distinguished careers of shopkeepers and clerks.

Last week the most unusual circumstance in the rates of mortality of our principal cities occurred, Dublin presenting the most favourable death-rate, with 18 per 1,000 of its population. In the same period Edinburgh gave 19, London 26, and Glasgow 25 per 1,000. Of the large towns in the second category Birmingham gave 26, Plymouth 26, Newcastle 26, Sunderland 26, Bradford 28, Leicester 30, Manchester 32, Sheffield 33, Salford 36, Leeds 37, Liverpool 38, and the highest rate 44 in Hull.

The mortality last week from the seven principal zymotic diseases averaged 9·7 per 1,000 in the principal towns of the United Kingdom, and ranged from 3·5 and 3·6 in Plymouth and Portsmouth, to 17·1 and 20·8 in Leeds and Hull. Scarlet fever showed fatal prevalence in Birmingham, and whooping-cough and measles in Sunderland. Small-pox caused 18 deaths in Dublin, 11 in London, but not one in any of the other large provincial towns.

The fatal cases of diarrhœa in the twenty-three principal towns, which had risen from 56 to 602, further rose last week to 991. The annual death-rate from this disease was equal to 6·3 in London, and averaged 7·9 in the nineteen other towns, among which it ranged from 1·8 and 2·1 in Norwich and Plymouth, to 13·3 and 13·9 in Leicester and Leeds, and 19·7 in Hull. Diarrhœa fatality showed a marked increase last week in Leeds, Sheffield, and Hull. In London alone there were 457 deaths from this cause.

It is officially reported at San Stefano that in the army to the south of the Balkans there are nearly 21,000 sick; in the army of the north, 6,500; and in the reserve, 5,500; but there is no increase in the amount of sickness, and the rate of mortality is comparatively low. Since March last, some 27,000 sick have been sent homewards by transport steamers. There are about 800 medical officers attached to the active army of the Danube.

Dr. Clarke, the Medical Superintendent of Pentonville Prison, has been promoted to a similar post in the Millbank Convict Establishment, after eight years service in the former. Previous to his departure, Dr. Clarke received the gratifying assurance that his duties had been performed to the satisfaction of the other officers, by the presentation of a handsome testimonial.

Mr. Bolckow, late M.P. for Yorks, whose will was proved under £800,000 last week, has bequeathed £5,000 to the North Riding Infirmary, and £1,000 to the Newcastle Infirmary.

At the opening of the winter session, Guy's, Bartholomew's, and the London Hospitals will give a *conversazione* this year, and will dispense with the introductory in consequence.

Medico-Parliamentary.

HOUSE OF COMMONS.—August 1.

THE LUNACY LAWS.

In reply to Mr. Dillwyn, Mr. Cross said that the state of business at the Home Office was such that he had had no time to read the report of the Select Committee on the Lunacy Laws. He would give his attention to the subject during the recess, and he should be able to state whether he would introduce a Bill on the subject at the beginning of next Session.

SCIENCE AND ART DEPARTMENT, DUBLIN.

In reply to Mr. Brooks, Lord G. Hamilton stated that the administrative work of the Science and Art Department, Dublin, as was the case at Edinburgh, would not be responsible directly to the Education Department for disbursing the sum annually voted by Parliament. The body entrusted with the supervision of the Science and Art Museum would consist of a board of twelve visitors.

August 2.

ARMY MEDICAL SERVICE.

In reply to Mr. Errington, Colonel Stanley stated that this year the usual examination for the Army Medical Service would take place in August. This was due to some possible changes which might be made in consequence of inquiries which had just been concluded; but he was not in a position to indicate the nature of such changes.

ST. BARTHOLOMEW'S HOSPITAL AND TITHES.

On the consideration of the Christchurch (Newgate Street, London) Tithes Commutation Bill, as amended,

Mr. Plimsoll moved that the Bill be referred to a Select Committee. The facts were briefly these. For 200 years the tithes in the parish of Christchurch amounted to £200 a year, but it had been discovered that, under an old Act of Parliament, St. Bartholomew's Hospital could make a claim, which the governors had put forward, for tithes at the rate of 2s. 9d. in the pound, realising about £7,000 a year. Litigation had taken place; the Master of the Rolls had expressed his great astonishment that any such claim should have been made in the name of charity, and had suggested a compromise. A compromise had been offered, and this the Bill would carry

out; but as the amount was excessive the Bill ought to be recommitted. According to the compromise the sum to be immediately paid would be £1,100, which in the course of five years would amount to £2,200 a year, at which it was to remain fixed.

Sir S. WATERLOW urged the House to pass the Bill. This dispute had been going on for years, and a considerable sum had been spent in litigation. The merits of the case had been thoroughly threshed out, and if the question were reconsidered no different decision would be arrived at.

The House then divided on the question that the Bill be now considered :—Majority for, 56.

AUGUST 5.

AMENDMENT OF THE MEDICAL ACTS.

IN reply to several members, the CHANCELLOR of the EXCHEQUER said it would be useless to attempt to pass this Bill during the present session.

Correspondence.

FOREIGN BODY IN THE NOSTRIL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A child was brought to me who had pushed a daisy up his left nostril. I found it impossible to get hold of it, partly from the struggles of the child, partly because it slipped away from the forceps. I therefore adopted the "American dodge," an emetic, a handkerchief being closely applied to the mouth as soon as vomiting took place. This was not successful, but after the action of the emetic was over, the child fell into a profound sleep, and on examination, I found that the flower had been turned round in the nostril, so that one edge was easily grasped by the forceps, and it was removed without awakening the child. The foreign body proved to be the yellow centre of the large ox-eye daisy, the rays having been pulled off.

Should any of my *confrères* be disposed to try the emetic plan in such a case, I would recommend allowing the stomach to be fully emptied by the mouth; then making the patient drink freely, and when the next paroxysm of vomiting comes on, secure the mouth. I would prefer this mode of treatment to giving chloroform.

Yours, &c.,

ALEX. WALLACE, M.D.,
L.R.C.P. Edin.

Parsonstown,
July 25, 1878.

THE URINE IN RABIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have read with great interest your annotation on the analysis of the urine in rabies made by Professor Robin. Like everything that emanates from the brain of this distinguish French *savant*, his last achievement is remarkable for its comprehensiveness, perfection, and minuteness of detail. It not only throws a flood of light upon the pathology of this terrible disease, but also opens up a new field for its rational treatment. What especially attracts attention in the analysis in question, is the scantiness of the urine, and its great richness in uric acid. These conditions arise, doubtless, from two causes: first, the inability or difficulty of taking fluids experienced by the patients; and second, the rapid oxidation of the nitrogenous and other elements of the body during the course of hydrophobia. Now, to antagonise the first, I am strongly inclined to believe that fluids may be taken by the victims of rabies, should the precautions or expedients suggested by me some short time ago in the columns of your journal, be adopted, namely, blindfolding or bandaging the eyes, or shutting up the patients in a room from which the light is to be rigorously excluded. The thought of liquids is a sad pleasure which they, in imagination, can never sufficiently gratify; but the *sight* of them is unfortunately their bane—the source of their greatest suffering. It is, indeed, the mythical story of Tantalus enacted upon the living stage. Such being the case, let them be spared this torture, and let them, by all means, be supplied with liquids without the aggravation of seeing them. In accomplishing this, the first great indication of treatment is fulfilled. To prevent undue or morbid oxidation of the tissues, and the consequent formation in excess of uric acid, no remedies can equal the alkaline (potash and soda especially), whose well-known action in this directon no longer admits of doubt or controversy. They not only subserve this purpose, but they also neutralise the acid products of combustion; and, by rendering them more soluble, ensure their effectual elimination from the system. They possess, moreover, another property, highly important in the treatment of hydrophobia—they quench thirst, and thereby appease the insatiable craving for liquids.

It may be in the recollection of some of your readers, that I recommended a combination of carbonate of soda and opium, in the proportion of ten grains of the former to one of the latter, to be taken every two hours, with a view, as I then thought, of destroying the lyssic virus, and combating the nervous and inflammatory elements of the disease. I had then no idea of the important facts recently revealed by Professor Robin, and which happily confirm the judiciousness of the treatment proposed, although for reasons somewhat different to those I entertained.

Trusting that the importance of the subject will be a sufficient excuse for trespassing so much upon your valuable time and space.

I am, &c.,

BERNARD KELLY, M.D.

Rotherhithe, London, S.E.
August 1st, 1878.

THE IRISH APOTHECARIES' COMPANY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As much has been said and written lately to the disparagement of the Irish Apothecaries' Corporation, I beg that you will kindly afford me space for a few words in their behalf.

The Apothecaries' Corporation had since 1791, by virtue of an Irish Act of Parliament, granted licenses to those candidates whom after examination they found to be prepared in the prescribed curriculum.

Now by various succeeding Acts of Parliament these licentiates are recognised as being more than mere vendors of drugs. For instance, 6th and 7th William IV., cap. 116, provides for apothecaries at coroners' inquests receiving fees as *medical witnesses*. 1st Victoria, cap. 27, renders the certificate of an apothecary available for placing lunatics under restraint.

5th and 6th Victoria, cap. 107, also 13th and 13th Victoria, cap. 33, enact that no ship carrying a certain number of passengers shall proceed on her voyage unless there be on board such ship some persons legally authorised to practice in the United Kingdom as physician, or surgeon, or apothecary.

The Right Hon. Mr. Napier, Q.C., late Attorney-General for Ireland, gave the following legal opinion :—"That the Irish apothecary was actually, according to usage and practice, and lawfully under the common law, a MEDICAL PRACTITIONER at the time of the passing of the Act of the 31st George III., cap. 34, that he was recognised as such in *previous*, and has continued to be so in *succeeding* statutes."

The examinations for the licence of the Hall must have been discharged fairly well, as will be seen from the following facts :—

1st. The public, who are most deeply interested in the skill and acquirements of medical men, have for very many years accepted apothecaries as medical attendants, and in not a few cases even though a physician or surgeon were equally available.

2nd. Because the scheme proposed by the Dublin College of Physicians for a conjoint examining board proposed three out of twenty-one examiners to belong to the Hall.

3rd. Because the National Medical Council admits apothecaries to the register without any other diploma, thereby setting them on the same public footing as the physicians and surgeons.

From all these considerations the apothecaries are surely deserving of representation in the new conjoint scheme.

In the letter of "L. A. H." in your paper of the 17th I was sorry to see an objection to candidates being examined n operative surgery. Now the examiners in the Hall have ways, during my eight years' acquaintance with them, de-

cleared their desire to make the examination *practical*. If surgery be admitted as a subject of study for this licence, then *practical* knowledge is as essential as the recognition of the actual drugs.

I have known a student of one of the colleges who described camphor most accurately, but when a piece was placed in his hand, first said it was soda, afterwards *white wax*. In my humble opinion it redounds to the credit of the Board, and shows that they wish to obtain the best qualified men as licentiates, and does not imply that they offer their licence at a cheap rate to very ignorant persons.

Again, in many villages the only medical practitioner is an apothecary, and does not common sense inform us how much better he can relieve suffering the more carefully and fully he has been educated? Suppose, for instance, an injured artery, is it not desirable that the apothecary should be able to tie it than that a fellow creature should die?

With the suggestion of "L. A. H." that all licentiates of the Apothecaries' Hall should have a vote in the election of the Council I perfectly agree, and until this end is obtained the apothecaries of Ireland will never be able to unite, and therefore never able to have the influence to which they are numerically entitled.

I will just mention, in conclusion, that the examiners of the Apothecaries' Hall have more than one F.R.C.S.I. and L.C.R.S.I. amongst them, so that if title confer ability, they surely *should* be capable of determining the fitness of the candidates to practice.

With many apologies for thus trespassing on your valuable space,

I remain, Sir, yours obediently,

HUGH A. AUCHINLECK, L.A.H., &c.

[We have to remind our correspondent that we have not expressed any opinion as to the professional competency of the licentiates of the Irish Apothecaries' Hall further than to reproduce a narrative respecting a recently licensed apothecary who, though possibly erudite in the highest degree on all surgical and medical subjects, showed himself grossly ignorant of the veriest elements of pharmacy and materia medica. Whether Irish apothecaries are or are not good physicians has nothing to say to our contention. We assert simply—*a*. That the Irish Apothecaries' Company was incorporated *solely* as a pharmaceutical body, and entrusted *solely* with powers to supervise pharmacy and licence pharmaceutists. *b*. That it never would have been recognised as a medical body by the army, navy, or Poor-law services, but for the tergiversation of Mr. Hargrave and Dr. Embleton, who having year after year voted in the General Medical Council against such recognition, eventually changed sides, and by their votes gave a majority of one in favour of the recognition of the licence of the Hall as a medical qualification. *c*. That the Hall has since then been recognised in examination schemes and otherwise, *not* as a medical body, but as the guardian of pharmacy in Ireland, and that having lost that guardianship by the creation of the Irish Pharmaceutical Society, it ceases to deserve a continuance of that recognition. *d*. That even if properly entitled to rank as a medical corporation, it grants so few licences, and at so miserable a price, and is constituted and managed so badly, that it has no claim to a voice in the settlement of medico-educational affairs. We have only to add that the recognition of apothecaries as medical witnesses and ship surgeons was intended by the Acts of Parliament to refer to the London Apothecaries' Company, which institution is formally chartered as a medical licensing body—a position which the Irish Hall never occupied.—ED. M. P. & C.]

Literature.

INSANITY IN ANCIENT AND MODERN LIFE. (*a*)

WE have to thank Dr. Tuke for this very readable and comprehensive essay on a subject which at the present time is pressing on the attention, not only of medical men, but of the general public. The previous writings of the author have established his reputation in the domain of mental medicine, and hence his more matured opinions on the present aspect of insanity and its supposed increase, are entitled to our most serious consideration.

The greatest diversity of opinion exists as to whether there is an actual increase in the annual number of lunatics in proportion to population. The conclusions of Dr. Tuke harmonise with those expressed in our columns (May 30th, 1877).

At the end of the first part of his essay Dr. Tuke thus expresses himself: "In conclusion, it may be said that the increase of recognised insanity in this country during the last half century has been enormous; that the great mass of this is easily explained by the attention of the public and Parliament having been directed to the care and treatment of the insane; by the consequent provision of asylums; by the lower rate of mortality; and by the increased stringency of the Commissioners in regard to certifying patients.

"Further, while the striking apparent increase which has taken place in the number of the insane is found to be among the working classes, there are manifest reasons why cases of insanity among them should have become more widely and correctly known than those among the higher classes; and why, therefore, there is actually a greater amount of insanity among the educated and wealthy than appears in the blue-books.

"Lastly, looking not at the accumulation of lunatics in in asylums, but at the admissions, and making every possible allowance for their considerable rise beyond that of the population, it is impossible to deny that there is reason to fear some real increase of occuring insanity."

Admitting the great fact, we have at the present time an enormous number of patients certified as persons of unsound mind in our English asylums, can we assign the causes?

Dr. Tuke's scholarly tastes have led him into an original method of inquiry, viz., whether, having regard to the main and well-known causes of insanity on the one hand, and the conditions of ancient life on the other, there is reason to infer that it was as extensively prevalent in the earlier as in the later ages of the world?

He has devoted the first part to the causes of insanity in pre-historic times, amongst the Jews and Egyptians, and the Greeks and Romans, and we have ample room for the display of his classical learning and antiquarian researches.

Amongst the acknowledged causes of insanity intoxication has been considered a most important factor, and Dr. Tuke has followed the vice through the different periods and nations. Though he has collected a large mass of valuable evidence, proving that drunkenness has been a vice from time immemorial, yet evidence points to the conclusion that in pre-historic times "there was not the curse of alcoholism in the form known at a later period in the history of our race;" that amongst the Jews it was not such a "scourge of society;" that amongst the Egyptians it did not lead to the frenzy or "the commital of crimes such as figure every day in our police courts;" that amongst the Greeks and Romans, though insanity occurred, yet it never reached the pitch proportionate to that of modern times.

Dr. Tuke has found that 12 per cent of the insanity in England is attributable to intemperance, but he admits that it feebly represents its indirect action. He has similarly compared other influences in ancient and modern times, as defective nourishment, poverty, &c., moral influences, intellectual strain, &c., with the result of being forced to admit that the forces which make up modern civilisation tend to the impairment of mental power.

The second part is devoted to a consideration of insanity in relation to modern life as it affects the various classes of society, and here we have some very interesting and important statistics.

The third part we may regard as the most important and practical, as it deals with the prevention of insanity.

It is evidently addressed to general readers, and impresses the importance of a number of general truths which cannot fail to be of service in warding off insanity in persons predisposed to this affection.

Dr. Tuke has managed to condense into a couple of hundred pages a large mass of information, and as it is presented in a readable and pleasant form we hope and anticipate for this work a wide circulation, not only amongst the profession, but general readers.

(*a*.) "Insanity in Ancient and Modern Life." By Dr. Hack Tuke, M.D. London: Macmillan and Co. 1878.

ON INFANTILE PARALYSIS AND SOME ALLIED DISEASES OF THE SPINAL CORD. (a)

In this little work of fifty-six pages we find the subject of Infantile Paralysis well and carefully considered. In this essay our author states that the affection is mainly caused by what he calls myelitis, which may or may not be induced either by central or peripheral causes.

As regards the pathology of the disease, he says, at page 3: "In experimental pathology some good and suggestive work has been done, which promises, if continued and enlarged, to give us a clearer insight into the mode of production of the structural changes which occur in diseases of the cord. Myelitis was first experimentally produced by Hayem and Lionville, who injected a solution of iodine in glycerine into the substance of the organ."

At page 6 we find the following observation: "Feinberg has experimentally produced myelitis in a rabbit by plying its hind legs, which were shaved, with ether spray for half-an-hour. The animal became anæsthetic and paralysed, and continued in that condition for about two hours; after which time it recovered. Six weeks afterwards, however, myelitis was developed, which proved fatal. Irritation of peripheral nerves may, therefore, be transmitted to the cord without inflammation of the intervening structures, and it is probable that this influence is exercised by means of the vaso-motor system of nerves, causing at first contraction, and afterwards paralytic dilatation of the blood-vessels."

At page 11 Althaus says that infantile paralysis is produced by a diffuse acute inflammation of the anterior horns, which is generally most intense in the cervical or lumbar enlargement, but may also affect the dorsal portion of the cord. It proves but rarely fatal within a few days or weeks from its invasion. Occasionally there may be no general symptoms at all, but the child is put to bed apparently in perfect health, is found next morning paralysed in a limb, or part of a limb, and ails otherwise nothing at all. This form of attack mostly occurs in hearty well-developed children, whose nervous system has already some power of resistance, and where the inflammation occupies only a small area, so as to cause paralysis limited to part of a limb, or only some sets of muscles. The attack of paralysis, however, is frequently ushered in in another way—viz., being preceded by high fever, general *malaise*, loss of appetite, and pain in the head—one or several such seizures occur, after which the paralysis sets in. Kussmaul called the pathological change in the spinal cord, polio-myelitis, which in other words means inflammation of the anterior cornu or grey matter in the cord.

At page 17 he says: "Anterior polio-myelitis of children is distinguished from other forms of spinal paralysis by there being no affection of sensibility, which remains perfectly normal. . . . ."

It is therefore exclusively motor paralysis, followed by muscular atrophy, to which is frequently added contraction and deformity.

The subject appears to be divided into four parts—viz.: 1. Infantile Paralysis. 2. Anterior Myelitis of Adults. 3. Chronic Spinal Paralysis. 4. Wasting Palsy. After which comes the Prognosis and Treatment of these different affections.

At page 26 we find the following observation: "Does infantile paralysis ever occur in adults? This might be considered a Hibernian question, but it is one which has often occupied the attention of pathologists. Some observers have denied that it occurs after eleven years of age, while a number of others have described cases of myelitis, and of post-febrile paralysis in adults, which show the greatest possible analogy with infantile paralysis."

We do not at all deny the truth of this observation, but we fail to see that it could possibly be mistaken for what the author has chosen to call a Hibernian question; and from our knowledge of the subject and the country alluded to, we think that part of the observation might have been omitted.

As regards treatment for these paralytic affections Althaus recommends in the acute stage of the disease the subcutaneous injection of ergotine in the proportion of ¼ grain for a child from one to two years of age; ⅓ grain for one from three to five years; ½ grain for children from five to ten years of age; ergotine being dissolved in distilled water. After the acute attack has passed away, iodide of potassium is to be given internally, with the local application of the constant galvanic current, not forgetting gymnastic exercise of the muscles, shampooing and friction of the paralysed limbs with the liniment ammonia, and other stimulating applications.

In conclusion, we recommend all interested in the subject to get this little work, as it contains a great deal of useful information, and will well repay a careful perusal of its pages.

Novelties.

A PRACTICAL PNEUMATOMETER.

An instrument under this name is described by Dr. Holden in the New York *Medical Record*. Properly it is a pneumasyren. It is of moderate cost, and portable, with the advantage that it may be prescribed for patients in whom the vital chest capacity is deficient.

The engraving shows the simplicity of the device, but not its mechanism. Briefly, it consists of a glass tube, one inch in diameter and ten inches in length, with metallic end-pieces, a piston made of two discs perforated by two rows of fine sloping holes precisely like the syren of Dove, a spiral spring, and finally an index and register. Expiratory and inspiratory efficiency, both actual and relative, are recorded, and the waviness and inequality of either are made evident to the ear.

Better and of greater advantage, however, than this is the fact that the instrument will, by constant or rather frequent use, develop chest capacity, re-dilate the cells collapsed and weakened by incipient disease, and by its allowing a free passage of air will do this without danger to the affected tissues—differing in this last particular from the ordinary pneumatometer, which, however perfect as an instrument for scientific observation, could hardly with safety be universally prescribed.

Forced *expiration* produces a low musical note gradually more and more high and intense, but sensitive to the least changes in the power exerted, while the index is steadily pressed toward the further end, and remains in place after the effort is exhausted. The latter has now to be pushed back with a wire replacer designed for the purpose, and by reversing the instrument full and forcible *inspiration* may be employed with similar results. The tube being graduated, the relation as well as the power of the inspiratory and expiratory efforts may be at once ascertained.

The instrument has been manufactured by Messrs. Shepard and Dudley, of 150 William Street, New York.

BUCELLAS HOCK.

The name of Sandeman is so well-known throughout the English speaking world as shippers of the finest port, that we noticed with some interest that the same house intended to introduce to this country a new wine, which they styled "Bucellas Hock." As it is not our custom to descend to the "puffs," which continually grace the columns of one or two of our contemporaries, we append herewith Professor Tichborne's Analytical Report of this wine as submitted to him by us, so that readers may form their own judgment of its value. His report dated July 25th, runs as follows:—

"In Shaw's work on the vine, we read of the great popularity of Bucellas wines in the year 1824. He says that in that year, there was such an extraordinary run upon that wine, that it rose to a very high price in a short time, and that the fine old stock was soon exhausted, and the shippers had resource to new and inferior qualities. Before it lost

cast, says the author, I recollect that for one bottle of sherry, there were two of bucellas placed upon the table at public dinners.

It was, therefore, with considerable interest that we examined this so-called Bucellas "Hock," Bucellas being a district near Lisbon.

"Bucellas Hock" is a white wine, containing in the fluid ounce, according to the samples analysed by us—

Sugar - - - - - -	8·5 grains.
Acid (calculated as tartaric acid)	3·3 ,,
Extractives and neutral tartarate of potash - - -	4·24 ,,
Total solids - - -	16·4 ,,
Proof spirit - - - - -	22·8 p. ct.

This is, therefore, a genuine wine of a good and sound quality. Owing to a considerable amount of bouquet peculiar to itself, and its large amount of grape sugar, it will bear diluting better than Rhine or Moselle wines, but we cannot see why this wine should be called a Hock. If we mistake not the term Hock is derived from Hockheim, one of the best known of Rhine wines, and except in colour we cannot trace much resemblance in this wine to those of the Rhine, to many of which it is decidedly superior. It has a flavour redolent of the soil, and somewhat of a sherry character, although we consider it a much more wholesome and natural wine than many now put upon the market under that name. Again, it is not precisely similar to the hocks in its chemical character, being not so dry, and not nearly so acid as most of the Rhine wines." During the hot weather, a particularly grateful and inexpensive "cup" may be made, by pouring about half of a bottle of this wine upon a few slices of freshly cut lemon peel, adding a bottle of soda water, and a little ice according to taste.

AN IMPROVED HYPODERMIC SYRINGE.

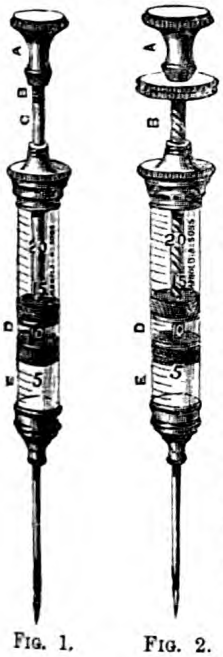

Fig. 1.

Fig. 2.

This illustration (fig. 1) represents a new patent hypodermic syringe with plain action, and fig. 2 the screw action.

The improvement upon existing instruments is that of self-lubrication. In a reservoir containing oil (in the centre of the plunger) a small piston rod is inserted inside the ordinary piston, and attached to the handle of syringe by means of a screw. When the reservoir is once filled with oil it will last a long time without renewal. The operation of refilling it is very simple, remove the handle and pour into the piston rod, which communicates with the reservoir (by means of a small glass syringe), as much oil as required, replace the handle, and the syringe is then charged ready for use.

Another advantage claimed over existing instruments is that the plunger, being constantly expanded by moisture, fits the handle accurately, and thereby prevents the possibility of the solution being forced behind the plunger.

The gradations on the barrel are accurately marked in *red* which is indelible, and the exact quantity injected can readily be seen.

Another important improvement is secured by having the mounts *screwed* on to the glass, thereby rendering it impossible to remove the mount from the cylinder unless by breakage.

The application of this self-lubricating plunger can be applied to all syringes, enemas, &c.

For India, the colonies, and all parts abroad, this invention will be invaluable, as it cannot get out of order, and will always be ready for use at a moment's notice. Messrs. Arnold and Sons, of London, are the makers and patentees of the new instrument.

THE BRITISH ASSOCIATION IN DUBLIN.

The following are amongst the arrangements made for the forthcoming visit of the above Association to Dublin: The meetings of the sections will take place in the Lecture Rooms and Halls of Trinity College, and the reception-room, which will be in the Examination Hall, will be open on Monday, 12th, at one o'clock, and on the following days at eight, a.m., for the issuing of tickets. A journal containing the announcement of the arrangements of each day will be ready every morning at eight o'clock for gratuitous distribution. In order to convenience the citizens of Dublin, lists of the members present will be issued immediately after the announcement of a specified meeting. The president, William Spottiswoode, Esq., LL.D., will deliver his address on the evening of the 14th, at eight o'clock, in the Exhibition Palace, and on the following evening a soiree will be held in the same building. On Friday evening, 16th, a lecture will be delivered by G. J. Romanes, Esq., F.L.S., on "Animal Intelligence." On Monday evening, the 19th, Professor Dewar, F.R.S., will deliver a lecture on "Dissociation, or Modern Ideas of Chemical Action." On Tuesday evening, 20th, there will be a soiree, and at half-past two on the following day the concluding general meeting will be held in Trinity College. The sectional meetings will commence on the morning of the 15th, and will be held each successive morning at eleven o'clock.

Arrangements have been completed for carrying out excursions, entertainments, and soirees, and up to the present the following have been fixed:—His Grace the Lord Lieutenant and the Duchess of Marlborough will give a reception at the Viceregal Lodge, on the afternoon of the 15th; and His Grace the Duke of Leinster will, on the 17th, entertain between one and two hundred members of the Association at a *dejeuner* at Maynooth, after the party shall have visited the College, and the historic antiquities associated therewith. The Corporation of Dublin will, on the 22nd, receive a number of visitors to inspect the Vartry Waterworks; and the Earl of Wicklow and the Earl of Carysfort will on the same day entertain the party at Shelton Abbey and Glenark Castle, which command splendid views of the interesting scenery in and about the Vale of Avoca. The Earl of Rosse will also entertain the leading members of the Association at Birr Castle on the 22nd. The Mayor and Corporation of Kilkenny, and the Marquis of Ormonde have intimated their intention of receiving a number of the members of the Association to visit Kilkenny Castle, St. Canice's Cathedral, and other places of interest in that city. Viscount and Lady Powerscourt have notified their desire to issue cards of invitation for a garden party at Powerscourt Castle on the afternoon of the 22nd; and the Port and Docks Board will entertain on board their steamer, Alexandra, a party anxious to visit the works at the North Wall, the lighthouse, and the varied beauties of Dublin Bay; and we understand that it is proposed to exhibit from Howth Lighthouse the electric light, under the supervision of the inventors, Messrs. Edmundson and Co., Capel Street, who will also display the Gramme electric light in the Exhibition Palace and Mansion House.

The Earl of Meath will invite a number of members to his hospitable mansion at Kilruddery on the 17th, and Lord Talbot de Malahide will have the pleasure of showing the antiquities and attractions of Malahide Castle to a party of visitors on the same day. Other contemplated excursions are "the lone and singularly wild valley of Glendalough" and the Seven Churches, and to the Boyne and Blackwater, including Slane Castle Demesne, and Beauparc, Lucan, Leixlip, Salmon Leap, and Lord Anally's, Woodlands. Howth Castle will be visited by the botanical and archæological sections. The municipal authorities of Cashel have afforded the members an opportunity of inspecting the Rock of Cashel and the classic scenery and archæological possessions which the town can boast of, and it is anticipated that Professor Mahaffy will act as *cicerone*.

The Right Hon. the Lord Mayor will give a grand banquet at the Mansion House on the evening of Saturday, the 17th.

The Royal Dublin Society will give a *conversazione* in their buildings on Thursday, 15th, and it is expected that Mr. Stanley, the great African explorer, and Captain Burnaby will be present at the *conversazione*. There will be a *conversazione* at the Royal College of Surgeons on Monday, 19th, and on the morning of that day the principal associates will be entertained at the Phœnix Park by the Royal Zoological Society, and a public dinner at the College of Physicians will bring the events of that day to a close. Another *conversazione* will be given on Tuesday, the 20th, by the members of the Royal Irish Academy, at whose disposal for the occasion the Corporation have placed the Round Room and other apartments of the Mansion House, which will be artistically decorated.

On the evening of the 21st a dinner will be given by the Royal College of Surgeons, and on the morning of the 23rd an excursion will start for Belfast, stopping at Lisburn for the purpose of visiting the principal manufactories of that town, and most generous arrangements have been made for the hospitable reception of the excursionists in Belfast by Sir John Preston, Mayor, and the leading citizens of the northern capital.

REGISTRATION OF DENTISTS UNDER THE NEW ACT.

THE Executive Committee of the Medical Council meet this day, and will, we take it for granted, declare the Dentists' Register open. The production of a declaration showing that the applicant is in practice at present, and the payment of £2 to Mr. Miller at the office, 315 Oxford Street, are the only requisites for registration. Meanwhile, the Royal College of Surgeons in Ireland has determined to elect a Board of Examiners consisting of three Fellows of the College, and three registered dentists on the 15th inst., and to hold the first examination on Saturday, the 24th. The fee is fixed at ten guineas, and certificates of having refrained from advertising, &c., for two years previously must be presented.

Medical News.

Testimonial.—A gratifying mark of respect was presented to Mr. Burroughs, surgeon, of Weston Zoyland, Bridgwater, on leaving the neighbourhood a few days ago, consisting of a handsome clock and inkstand, by the Board of Guardians of the Bridgwater Union, and by the people of the district.

Royal College of Surgeons of England.—The following gentlemen, having passed the required examination, received the diploma of M.R.C.S., at meetings of the Court of Examiners on the 25th ult. :—

Dymott, D. F., Southampton
Elliott, H., Westminster Hosp.
Evans, J. W., Trevaughan
Faulkner, J. T., Urmston
Harris, F. Alfred, Reigate
Hine, A. Leonard, Chelsea
Hunt, E. Atlee, Montague Street
Jennings, Edward, Brighton
Jones, T., New Quay, N. Wales
Lendon, A. Austin, Maidstone
MacDougall, A. R., Carlisle
Sweef, W. J., Hebburn-on-Tyne
Tuke, W. S., Charlotte Street
Warwick, Percy, Hastings
Whitney, N. S., Gt. College Street

The following passed on the 26th ult. :—

Baker, Thos., Cosham, Hants
Bryden, R. J., Uffculme, Devon
Claremont, C. C., Hampstead Rd.
Davies, J., Caersws, Montgomery

Shaun, H. Charles, York
Stewart, I. M'D., Cambridge Gdns.

Anæsthesia by Rapid Respiration.

A THESIS, under the above title, has been awarded the Toner gold medal at Jefferson College, Philadelphia. In this essay a good description is given of Dr. Ponwill's method, of which the following *resumé* will be read with interest :—

He found that air drawn into the lungs, in quantities three or four times as great as required by the body, was capable of producing anæsthesia sufficiently profound to render minor surgical operations painless. Dr. Bonwill could only account for the anæsthesia by giving the credit of its production to a super-oxygenation or a surplus of nitrogen, or to a mixture of the two, and concluded from numerous experiments, that—

1st. Breathing full, at ninety to the minute, will produce anæsthesia of the surface of the body in less than five minutes, so that a pin or needle thrust half-an-inch into a limb is not felt.

2nd. This anæsthesia is not due to a "surplus of oxygen, or of nitrogen, or of the two combined," but follows from the rapidity of the breathing, according to laws certainly known since the beginning of this century.

3rd. The rapidity of the breathing induces the anæthesia by the following sequence :—

a. By its over-action the blood of the body is determined towards the lungs. [Any muscle or organ violently exercised for a short time, receives a surplus of blood ; a well-known fact.]

b. The blood having assumed this centripetal determination, leaves the surface of the body.

c. When the surface of the body is deprived of its blood, superficial anæsthesia supervenes. Wardrof, in 1819, produced anæsthesia for surgical operations by venesection until the surface was completely blanched.

d. A part completely deprived of communication with the trunk by blood supply or return, will be anæsthetised. But (*d*) is not necessary, from the fact that for amputation, the surgeon will depend on an established anæsthetic. The complete withdrawal of the blood from a part involves an anæmia of the nerves, which probably is the direct cause of the anæsthesia.

With these facts before him, the experimenter can account for the congestion of the lungs ; the tingling first felt at the extremities, and extending towards the central organs ; the laboured action of the heart ; the clammy sweat and cool surface produced by Bonwill's method. He will also understand the return of the natural status after the discontinuance of the rapid breathing.

The fact that the lungs and central organs have the blood of the body thrown upon them, awakens the careful surgeon to the danger of the indiscriminate application of this method.

NOTICES TO CORRESPONDENTS.

DR. LEISHMAN.—Thanks, with pleasure.

DR. QUINN, Liverpool, will find all the information he seeks about the various schools in our Student's Number, 1877-78.

MR. HAZEL.—Probably in our next.

IRISH POOR-LAW INTELLIGENCE.

QUARTERLY RETURN OF THE BIRTHS AND DEATHS REGISTERED IN IRELAND.

Quarter ending March 31, 1878.

During the quarter there were registered in the 796 Registrar's districts in Ireland 35,163 births—an annual birth-rate of 26·3 in every 1,000—and 28,348 deaths, representing an annual mortality of 21·2 per 1,000.

In England, during the same quarter, the birth-rate was 36·2, and the mortality 22·8 per 1,000.

The births in Ireland are much under the average for the March quarter, the deaths about the average. The total mortality from the principal zymotic diseases is heavier than in any of the preceding ten quarters, the increase being chiefly due to measles and its sequelæ, the fatal cases of which were very numerous.

Returns received from the Local Government Board show a considerable increase in the recipients of Poor Relief, both indoor and outdoor, compared with the numbers in the first quarter of last year; when compared with the average for the March quarter of the ten years 1868-77, the returns for the last quarter show a decline in the number of workhouse inmates, but a much larger increase in the number of persons on outdoor relief.

Births.—The births amounted to 35,163, being equal to 26·3 per 1,000 of the estimated population. The average ratio of the corresponding quarter of the last five years was 28·0 per 1,000. The respective rates of the four provinces last quarter are—Leinster, 25·6 per 1,000 persons, Munster, 27·1, Ulster, 25·3, and Connaught, 28·2. The county birth-rates range from 19·5 per 1,000, the rate for Wicklow to 32·0 per 1,000 in Kerry. Between these, the five highest are Mayo, 31·2 per 1,000; Dublin, 30·4; Antrim, 29·9; Leitrim, 28·6; and Galway, 27·6; and the five lowest—Kildare, 21·7; Queen's, 21·8; Meath, 22·7; Longford, 23·0; and Armagh, 23·1 per 1,000.

Deaths.—The deaths during the quarter amount to 28,348, affording an annual ratio of 21·2 per 1,000, against an average rate of 21·4 per 1,000 for the corresponding quarter of the last five years. The death rate of Leinster was 24·3 per 1,000, in Munster, 21·4, in Ulster 20·6, and in Connaught 17·3. The extremes of the county rates are:—15·4 per 1,000 in Mayo, and 30·6 per 1,000 in Waterford. Of the intermediate rates, the five highest are—Dublin, 28·8 per 1,000, Wexford 25·9, Kilkenny, 25·5, King's, 23·7, and Antrim 22·9; and the five lowest, Clare, 16·6, Kerry, 16·9, Galway, 17·3, Kildare, 18·1, and Sligo, 18·3 per 1,000. The deaths of 12 persons returned as aged 100 years or upwards were registered, viz.:—3 each at 100 and 101, 1 each at 102 and 103, 2 at 104, one at 108, and 1 (a woman) stated to have been 112, but the Registrar of the district (Ballyhooly, Fermoy Union), where the last named death occurred, has doubts as to the accuracy of the return

HEALTH OF THE PEOPLE.

The effects of the very unsettled weather which characterised the greater part of the first quarter of 1878 are seen in the heavy mortality from affections of the respiratory organs, whether as primary diseases or as secondary symptoms in cases of measles and whooping-cough. It is true that the total mortality for all causes is not over the average for the March quarter of the last five years, but it is considerably in excess of that for the first quarter of 1877, in which the weather, although broken, did not prove so fatal to the old, and in which there was not the prevalence of measles which led to so many deaths last quarter. Cases of small-pox were numerous in Dublin; the disease also appeared in Belfast, and there were a few sporadic cases in various parts of the country. On the whole, the quarter was an unhealthy one, and although in many districts sanitary observances received due attention, it must be confessed that there are some localities in which there seems to have been but little effort made to avert the outbreak of epidemic diseases.

The Registrar of Naas District remarks:—"The sanitary state of Naas is very bad, no public sewers to receive sewerage from the houses except those made by the county to take the surface water off the streets, and many I believe to be choked at the lowest levels. Not long since when opened to be cleaned, there were three-fourths of some of them filled with solid matter."

From Roscommon the Registrar writes:—"Up to the present time no attempt has been made to improve the drainage or provide a proper supply of pure water."

The Registrar of Ratoath District, Dunslaughlin Union, remarks:—"During the latter part of January and beginning of February there was a very severe outbreak of whooping-cough and diarrhœa in the village of Ashbourne. There were 5 deaths from the former and 2 from the latter. The sanitary condition of the village is very imperfect, and the water supply bad."

The report of the Registrar of Irvinestown, No. 1 District, presents a great contrast to the above; he says:—"The district is in a very satisfactory state; Sanitary Act well carried out, and the waterworks are now completed, so that the inhabitants of Irvinestown have a good supply of most excellent pure water." As a supplement to these remarks it may be added that in the entire of the Union of Irvinestown, with a population of 20,000, the only death from any of the principal zymotic diseases registered during the quarter is one from whooping-cough, and that of 72 deaths from all causes, 42 were of persons aged 60 years or upwards. Several Registrars refer to the wretched house accomodation for the poor in their districts.

Diseases.—The number of deaths returned by the Registrars as having resulted from the 8 principal zymotic diseases is 2,809, or 9·9 per cent. of the total deaths registered, and 52·5 of every 100,000 of the population. The number is 361 over the deaths from the same causes in the corresponding quarter of 1877, and 109 over the average mortality for the first quarter of the three years 1875 to 1877.

Small-pox.—There were 88 deaths from small-pox registered during the quarter, 58 of which occurred in the two Dublin Poor-law Unions; 17 in Belfast; 2 each in Celbridge, Roscrea and Limerick Unions; and 1 each in the following Unions:—Downpatrick, Larne, Newtownards, Rathdrum, Shillelagh, Kilrush and Tobercurry, the total number for the Province of Leinster being 62, for Munster 5, Ulster 20, and Connaught one. Non-fatal cases of small-pox are reported by the Registrars of the following Districts:—Saintfield, Drumconrath, Dunlavin, and Rathmore. Most of the Registrars in whose districts small-pox appeared have furnished observations, more or less copious, bearing on the several cases (See Registrars' Notes pp. 38—44), but unfortunately, in some instances, precise information as to vaccination was not obtainable. The Deputy-Registrar of No. 1 South City District, Dublin, remarks: "Of the fatal cases of small-pox 19 were unvaccinated, 2 were vaccinated and had fairly good marks, 2 not stated as to whether vaccinated or not, and 8 had very bad, and scarcely to be distinguished marks." The Registrar of Crumlin District, Antrim Union, says, "Vaccination is fully and regularly carried out, and there has been no small-pox in the district for years, although it is so near Belfast that many of the inhabitants are in daily communication with that town.

Measles.—The deaths from this disease and its sequelæ amount to 865, whereof 269 occurred in the province of Leinster, 455 in Munster (including 122 in the county of Cork, 95 in Tipperary, and 159 in Waterford), 110 in Ulster, and 31 only in Connaught. The deaths from this cause have been gradually increasing since the third quarter of the year 1876, in which they did not equal one-tenth of the heavy, and for many years, unprecedented, mortality recorded last quarter. There is no doubt that the greater number of these deaths are not due to the primary disease, but to pulmonary complications, the prevalence and severity of which have been commented on by several Registrars. Thus the Registrar of Tipperary District, where the disease caused 42 deaths, or more than one-third of the deaths of persons under 60 years of age, remarks:—"Inflammation of the air passages and lungs was a frequent complication, and caused most of the deaths." The Registrar of Carlow District says:—"Measles was unusually prevalent during the quarter, and proved fatal, as will be seen by the return, in 12 instances. The complications which rendered the disease so dangerous were those referrible to the lungs, and were induced by exposure to cold." In Moroe District, Limerick Union, with a population of 6,092, measles caused 24 deaths; the Registrar remarks:—"A serious outbreak of measles took place in this district during the past quarter. It was of a malignant type, the lungs and kidneys appeared to suffer most. There were 24 deaths out of about 200 children who had the disease. The disease, in my opinion, was much influenced by bad sewerage, ill-ventilated houses, extreme poverty of the poor, and want of cleanliness amongst the people." In Newry, No. 2 District, measles caused eleven deaths, the mortality from all causes amongst persons under 60 years of age being 50; a mild type of the disease had been prevalent for some months; in February it assumed "a very malignant form, and hardly a house in the poorer parts of the town has escaped." In Gorey District measles and its sequelæ caused 16 deaths, or one-third of the deaths of persons under 60; in Kells District 11 deaths, which "with one or two exceptions . . . occurred in wretched one-roomed cabins, or still more wretched tenement houses, where the protection from against the keen spring winds . . . was of the slightest nature;" in Wicklow District 10 deaths, or one-fourth of the mortality amongst persons under 60; in Drumlish District, Longford Union, 14 deaths, being one-half of the number under 60; in Ballyleague, Roscommon Union, 8 of 28 deaths under 60; in Killenaule, Cashel Union, 5 of 14; in Callan District, 14 of 39, and in Mullinahone, in the same Union, 7 of 12; in Dungarvan District, 22 of 66; in Fermoy Union, 30 of 105; in Lismore District, Lismore Union, 16 of 36, and in Tallow District, in the same Union, 11 of 26; in Waterford District, 76 of 292; in Clashmore District, Youghal Union, 6 of 11 (10 deaths from measles occurred in other districts in this Union); in Cork No. 3 District, 16 of 59; and in Killfinnane District, Killmallock Union, 10 of 40. It should be added that numerous though the deaths from this cause are, several Registrars remark on the small mortality in their districts, in proportion to the number of persons attacked by the disease.

Scarlet Fever.—There were only 178 deaths referred to this disease, viz., 45 in the province of Leinster, 31 in Munster, 58 in Ulster, and 44 in Connaught. In a few districts the outbreak of the disease was comparatively severe, for example. in Buncrana District, Inishowen Union, it caused 8 of 34 deaths registered; in Tinahely District, Shillelagh Union, 4 of 24; in Athleague District, Roscommon Union, 8 of 34; in Cappaghduff District, Ballinrobe Union, 5 of 20; in Ballycroy District, Newport, 5 of 15 deaths—The Registrar remarks, "Scarlatina is very prevalent in this district; the public have been, and are still, closed in consequence. The sub-sanitary officers and myself have instituted a house-to-house visitation for the purpose of disinfecting houses in which it occurred, and otherwise seeing after the public health;"—in Newport District, in the same Union, 5 of 31 deaths; and in Cloonbur No. 1 District, Oughterard Union, 4 of 26 deaths. However these are isolated instances, and the total number of deaths from scarlet fever contrasts most favourably with the mortality for some years past.

Diphtheria.—This disease caused 17 deaths in Leinster, 25 in Munster, 35 in Ulster, and 5 in Connaught, the total, 82, being 17 under the number of the first quarter of 1877, but somewhat in excess of the deaths in the subsequent quarters of that year. There were 6 deaths from diphtheria in Ballymoney District, Ballymoney Union.

Whooping-Cough and its complications caused 441 deaths, being 143 over the number in the preceding three months, but still only about the average for the March quarter, in which the pulmonary symptoms are generally most severe. Of the 441 deaths, 168 occurred in Leinster (including 171 in the City of Dublin), 133 in Munster, 71 in Ulster, and 69 in Connaught. In Doagh District, Antrim Union, whooping-cough caused 9 deaths, the deaths from all causes amongst persons under 60 years of age being 38; in Belfast, No. 7 District, it caused 4 of 19 deaths under 60; in Baltinglass District, 6 of 25; in Brideswell District, Athlone Union, 5 of 19; in Glassan District, in the same Union, 4 of 15; in Ballygawley District, Clogher Union, 4 of 9; in Elphin and Roosky Districts, Strokestown Union, 7 of 25; in Carrigaholt District, Kilrush Union, 4 of 19; Kilrush District, 6 of 38, measles causing 5; in Killmaganny District, Callan Union, 6 of 24; in Middleton No. 1 District, Middleton Union, 5 of 23; in Waterford District 31 deaths; in Queenstown Districts, Cork Union, 13 of 60 deaths under 60 years of age; and in Macroom District, Macroom Union, 6 of 31.

Fever.—The total number of deaths from the several types of continued fever is 680, being somewhat under the average for the March quarter; these deaths are distributed as follows:—In Leinster 154, nearly one-half of which occurred in Dublin; in Munster, 173; in Ulster, 216, of which 77 were in Belfast Union; and in Connaught, 137, including 50 in the county of Galway, and 46 in the county of Mayo. The Registrar of Belfast No. 2 District remarks—"Cases of malignant typhus fever still too common; sanitary authorities doing all in their power to check it." In Church Hill District, Ballyshannon Union, with a population of 2,453, fever caused 5 of the 18 deaths registered, and scarlatina 3; the Registrar says—"Scarlatina and fever (typhoid and typhus) prevailed," but adds, "The district has now, however, as far as I can learn, returned to its usual healthy condition." In Ballinrobe District, Ballinrobe Union, 6 of the 49 deaths registered were caused by fever; and in Cappaghduff District, in the same Union, of the 20 deaths registered in a population of 3,779, fever caused 5, scarlatina

5, and whooping-cough 1 ; in Belmullet Union, 6 of the 52 deaths registered resulted from fever ; in Loughrea Union, 13 of 97 deaths ; in Lettermore District, Oughterard Union, 7 of 20 deaths; in Eyrecourt District, Portumna Union, 3 of 16 deaths ; in Cloyne District, Middleton Union, 3 of 20 deaths ; and in Unionhall District, Skibbereen Union, 4 of 35 deaths.

Diarrhœa.—The deaths ascribed to diarrhœa number 472—viz., 94 in Leinster, 149 in Munster, 180 in Ulster, and 49 in Connaught. This mortality differs but little from the average for the March quarter, and except, perhaps, the fact that 5 of the 36 registered in Ahoghill District, Ballymena Union, were attributed to this cause, the district returns contain nothing relating thereto which calls for special remark.

Simple Cholera.—There were 3 deaths referred to this cause, of which 2 took place in Leinster, and 1 in Munster.

Several deaths from erysipelas were registered during the quarter, and among the miscellaneous items observed in the Returns may be noticed the occurrence of "a great many cases" of influenza in Dirraw District, Ballmoney Union, and 3 deaths from croup in a total of 8 deaths in Kilgobban District, Tralee Union.

CORRESPONDENCE.

ABUSES OF DISPENSARY TICKETS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—That the appointment of medical officer to an Irish dispensary district is not an enviable one, is well known to the profession. The work is hard, and the emoluments light, the nature of the duties irksome, and the social status of the doctor is not good. Guardians, and members of committees, are generally sensible to the defects in the appointment, and to their gentlemanly and considerate conduct is due the possibility of holding it at all. Occasionally, however, the action of those honorary officials is neither gentlemanly, nor considerate, and when the medical officer finds himself aggrieved, except by pressure of public opinion, he experiences difficulty in getting any redress. The following cases will exemplify the petty annoyances to which dispensary medical officers may be subjected by hos ile guardians.

In my district a medical gentleman was in attendance on a patient—the instructions he gave for the disposal of his patient were not altogether approved of by the friends. A guardian close by, says, "Here, you may as well have the opinion of our dispensary doctor ; I'll give you a 'red line,' it'll cost you nothing." If this patient, of his own accord, was paying his doctor, was it not too bad of the guardian to encourage or suggest his throwing himself on dispensary relief? Again, the son of a small farmer, who could pay the necessary fee for attendance, delivers me an order to visit his father, but in course of conversation, to my astonishment, he is utterly ignorant of the nature of the ticket he has just handed me, and unhesitatingly signs the subjoined statement :

"To Dr. C——. I do not think it necessary for you to visit my father, nor did I seek a visiting line from (ticket issuer's name), nor did I know it was a visiting line, nor the nature of the paper he gave me until you told me.—WILLIAM C——."

I notified the ticket issuer in this latter case, that if he forced my services on the patient in question, contrary to the wishes of the patient or his family, that I should hold him responsible for a guinea fee. He did so, and I am about to prosecute him for the fee. Will you kindly publish this letter in the MEDICAL PRESS, and favour me with your remarks on the legality of a guardian pushing his medical officer on another doctor's patient, or sending him where his services are not sought, and not desired? Yours truly,

J. A. C.

[In the present state of the law, the dispensary doctor is bound to attend every case in which he is presented with a ticket, even if the ticket be improperly granted, and irregularly filled up, and the recipient well able to pay. Therefore, even if a ticket is forced upon the recipient without his knowledge or consent, the doctor must attend upon it, and must seek his remedy afterwards. There are several means of obtaining such remedy. *Firstly*, the doctor may, and should, apply to the Committee to cancel the ticket. *Secondly*, he may appeal to the Local Government Board against the breach of the committeeman in issuing the ticket under such circumstances. *Thirdly*, he may sue the committeeman for the fees incurred. In the case of Woods *v.* Cromley (Monaghan Quarter Sessions), this suit was successfully sustained, and, in the interest of his profession, our correspondent is bound to follow up the claim which he has against the grantor of the ticket. On the whole case, we advise him to send a minute statement of the facts (giving the dates and circumstances with accuracy, together with copies of any correspondence thereon) to the Hon. Sec. of the Irish Medical Association, and our correspondent may then feel assured that he will be advised and supported as the case deserves.—ED. M. P. & C.]

ENNISKILLEN GUARDIANS.

THE GLAN DISPESNARY.

A LETTER was read from the Local Government Board directing attention to a letter from Dr. Flood of the Holywell Dispensary District, complaining of the small salary of £15 a year allowed him by the Enniskillen board of guardians, for attending once a week at the new dispensary at Glan. He had to attend Blacklion twice a week, and once a week at Dowra ; and the cost of a post-car to Glan alone would be over £18 a year. Dr. Flood added that the Enniskilen board of guardians were generally fair towards their servants, and he hoped the Local Government Board would not sanction such a small allowance.

The Clerk said the dispensary committee recommended the payment of £20, and the guardians allowed only £15.

Mr. Weir said that one of the strict members of committee who had signed for £20 recommended £12 or £10.

Mr. Carson—The members of committee wish it £10, but they have not the courage to say so, and they desire us to do it.

The board directed that the correspondence be sent back to the dispensary committee.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF JULY, 1878.

JULY 1st.—Garland, James; 9 Bloomfield Terrace, N. Circular Road, Dublin; Lic. R. Coll. Surg. Irel. 1876.

3rd.—Hughes, Richard Lawlor; 2 North Strand Road, Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

5th.—Burke, James Michael; Queenstown, Castle Dalkey, co. Dublin; Lic. R. Coll. Surg. Irel. 1877.

5th.—Ross, Frederick Agilby; Barley Park, Limavady, co. Derry; Lic 1877 and Lic. Mid. 1878 R. Coll. Surg. Irel. M.B. Univ. Dub. 1878.

6th.—Roberts, Frederic Joshua; Summer Hill, Enniscorthy, co. Wexford; Lic. R. Coll. Surg. Irel. 1878, Lic. 1876 and Lic. Mid. 1876 K. Q. Coll. Phys. Irel.

8th.—Hethrington, Reynolds Peyton; Athlone, co. Westmeath; M.B. Univ. Dub. 1878.

8th.—Cox, Henry Laurence; Portrush, co. Antrim; M.B. 1878 and B.Ch. 1878 Univ. Dub.

8th.—Johnston, Robert Henry; 26 Eccles Street, Dublin; M.B. Univ. Dub. 1878.

18th.—O'Connor, Daniel Roderick; 28 Patrick's Hill, Cork; M.B. 1878 and Mast. Ch. 1878, Q. U. Irel.

11th.—Kennedy, Hugh; 49 Eccles Street, Dublin; Lic. R. Coll. Surg. Irel. 1876.

11th.—Warnock, Robert; Aughadreena House, Fintona, co. Tyrone; Lic. R. Coll. Surg. Irel. 1878.

12th.—Bell, Thomas Vesey; Enniskillen, co. Fermanagh; Lic. R. Coll. Surg. Irel. 1877, Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

13th.—Taylor, David; Clandeboye, co. Down; M.D. Q. Univ. Irel. 1877.

13th.—Fox, Patrick Halion; Ardnacreeney House, Ballymahon, co. Longford; Lic. 1877 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

13th.—O'Kelly, Thomas Edward; Maynooth, co. Kildare; Lic. R. Coll. Surg. Irel. 1877, Lic. R. Coll. Phys. Edin. 1878.

15th.—O'Neill, John Gregg; 12 Manchester Street, Manchester Square, London; M.B. 1878 and B.Ch. 1878 Univ. Dub. Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

16th.—Inman, Arthur Walter Patrick; Anglesea House. Blackrock, co. Dublin; M.B. 1878 and B.Ch. 1878 Univ. Dub.

16th.—Cowen, Edward James; Cleenish, Enniskillen M.B. 1878 and B.Ch. 1878 Univ. Dub.

16th.—Nugent, Guy Perceval Lestrange; Ardrahan, co. Galway; M.B. 1878 and B.Ch. 1878 Univ. Dub.

16th.—Wilkinson, William Cleland; 17 Beresford Road, Birkenhead, Cheshire; M.B. 1878 and B.Ch. 1878 Univ. Dub., Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

18th.—Kirker, Gilbert; Royal Hospital, Belfast; M.D. Q. Univ. Irel. 1876, M. R. Coll. Surg. Eng. 1877.

18th.—Hilary, Michael; R. Coll. Surg., Stephen's Green, Dublin; Lic. R. Coll. Surg. Irel. 1861, Lic. Apoth. Hall Dub. 1878.

18th.—Neville, William Cox; Roden Place, Dundalk, co. Louth; M.B. 1878 and B.Ch. 1878 Univ. Dub.

18th.—Bennett, Edward; Shannon Vale, Clonakilty, co. Cork; Lic. R. Coll. Surg. Irel. 1878, Lic. 1878, and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

19th.—Hawkins, John Sneyd; Northumberland Lodge, Upper Leeson St., Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. 1878 and Lic. Mid. 1878, K. Q. Coll. Phys. Irel.

23rd.—Hall, James Campbell; Morne Abbey, Kilkeel, Newry, co. Dublin; Lic. Med. 1877 Lic. Surg. 1877 M.B. 1878 and B.Ch. 187- Univ. Dub., Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

24th.—Carson, Walter Peter; 25 Harcourt Street, Dublin; M.B. Univ. Dub. 1878, Lic. R. Coll. Surg. Irel. 1878.

17th.—Crofts, James Groves; Ashgrove House, Upper Rathmines, co. Dublin; Lic. 1878 and Lic. Surg. 1878 Univ. Dub.

26th.—Croghan, Edw. Henry; 142 Capel St., Dublin; Lic. Apoth. Hall Dub. 1878.

LECTURES ON LOCALISATION IN CEREBRAL DISEASE.

By Prof. CHARCOT, M.D.,

Physician to the Salpetrière Hospital, Member of the Academie de Medicine, Paris; Fellow of the Clinical Society of London, &c., &c.

(*Continued from page 79.*)

Origin of the Cerebral Portions of the Optic Nerves.

You may have remarked in the anatomical description just given that the quadrigeminal tubercles constitute the only region near the median line, where the optic tracts, after crossing in the chiasma, meet again. Is there at this point a supplementary decussation which, according to the hypothesis which I have brought forward, would bring back the optic nerves into the condition of nerves in general? This question would be very difficult to answer by means of anatomical details alone. Doubtless, in the median line, between the quadrigeminal bodies, there are numerous decussations which are verified by anatomy. But we should scarcely be able to decide that these decussating fibres were connected with the optic nerves, and still less that they are fibres from those nerves which have not passed over in the chiasma. Experimentation and pathology will probably take the lead in settling the question. Experiments made by Flourens have shown that ablation of the optic tubercles in birds and mammals results in amblyopia or crossed amaurosis. But in these the ocular axes are directed outwards, and in them the chiasmal decussation is doubtless complete.

In man, data for the solution of the matter are still wanting. Lesions of the quadrigeminal tubercles are not so very rare, but they are usually bilateral, and as they then cause double blindness, prove nothing. In fact, we have still to inquire whether lesion of the anterior quadrigemina will (like lesion of the optic tract) cause lateral hemiopia, or, on the contrary, crossed amblyopia, as it ought to be according to my hypothesis. In favour of the latter, I can only cite an observation made by Dr. Bastian in a case of unilateral lesion of the anterior quadrigemina resulting in crossed amblyopia. At present this is an isolated case, and it is related with too little detail to be decisive.

It remains for me to inquire whether crossed amblyopia is the only kind of functional disorder of vision which can result from lesion of the brain proper, or whether hemiopia may not also, as the writers say, result from certain localisations in the hemisphere. This is a point which I consider cannot be at present decided. In the absence of conflicting autopsies, I incline to believe that in most cases of hemiopia which have been attributed to a brain lesion, this lesion was not in the substance of the hemisphere, or extended in a basilar direction until it affected one or both optic tracts directly or indirectly.

To show that lesions in the substance of the brain cause hemiopia (lateral hemiopia), cases are called up in which the original trouble has arisen suddenly in consequence of an apoplectic seizure, at the same time that the limbs of one side are affected with paralysis of motion, and sometimes of sensation. Nothing is better established clinically than the existence of facts of this kind, of which M. Schoen has recently given many instances in an interesting paper. But as yet the post-mortem records have not really proved whether the lesions had affected the substance or the base of the brain. As you know, destruction or compression of one of the optic tracts causes lateral hemiopia, and, on the other hand, the anatomical relation between the tracts and certain parts of the isthmus, such as the cerebral peduncles, is well known. This being the case, a lesion in a suitable locality—in one of the crura cerebri, for example—might cause (with lateral hemiopia) motor hemiplegia, and, perhaps, hemi-anæsthesia. Such a lesion as a sudden hæmorrhage into the substance of the hind part of the thalamus might easily be followed by a like result. We can only see in such cases the phenomena of juxta position.

However that may be, it is well to remember that

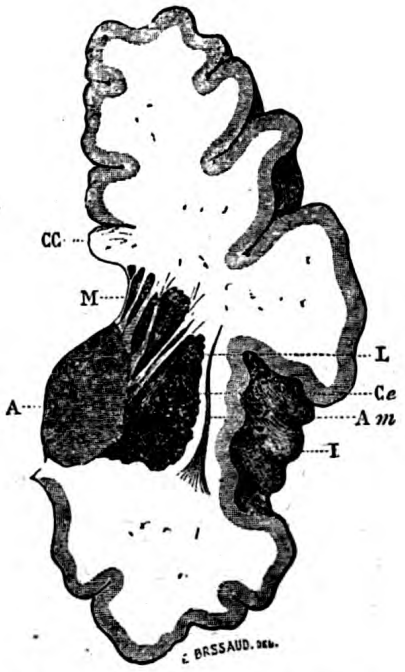
among the reported cases of lateral hemiopia, considered as intra-cerebral in their origin, there are some which do not admit of the interpretation I have given. For instance, there are instances in which right lateral hemiopia arises in concert with aphasia, and sometimes with affection of the mobility and sensibility in the right limbs. These cases do not form a homogeneous group. There is one category of instances of a peculiar kind of migraine (Tissot, Latham of Cambridge, Liveing of London) essentially transitory attacks, especially marked by scintillations, by more or less pronounced latent hemiopia, and sometimes accompanied by aphasia, by numbing of the face and right limbs; headache, nausea, and vomiting generally end the attack. Clearly, one cannot suspect in these cases the existence of any material change of substance. In another category are cases in which hemiopia, hemiplegia, and aphasia co-exist as permanent phenomena.

As matters stand, I do not see how these cases can be explained anatomically on the theory of a single form of lesion. I can only call attention to the difficulties to be solved in the future.

SECONDARY DEGENERATIONS.

We must now again transfer our attention to the *anterior region of the central masses*—to study more closely from anatomical and pathological points of view the results of lesions in those parts.

Fig. 34.



A, Optic thalamus: A*m*, Front wall; CC, Corpus callosum; I, Insula; L, Locus of former softening of the middle of the caudate nucleus and of the internal capsule. This part is really a sort of space which is separated from the lateral ventricle only by a membranous layer which has resisted the diserse.

This anterior region, which might be called *lenticulo striated*, in distinction from the posterior or *lenticulo optic* region, comprises, as you have been told: 1. The two anterior thirds of the white tract called the interior capsule; 2. Inside this the greater end or head of the nucleus caudatus; 3. On the outer side by the side of the insula the two anterior thirds of the neucleus lenticularis. Observations—and in this case many observations—as I have already remarked in the seventh and eighth lesson, show that common motor hemiplegia, unaccompanied by sensory troubles, is the result (in a sense, the fatal result) of all lesions however small, affecting the different parts I have named, always supposing that the lesions in question cause destruction or sudden compression of the nervous structures of the injured region, and not simply displacement gradually set up, as occurs so often in the case of tumours.

I have also remarked that on this point it is necessary to make an important distinction; it is this: lesions, extensive and deep though they may be, which are limited to the sphere of the grey nuclei (caudate or lenticular nuclei) do not, as a rule, set up well-marked and lasting symptoms, while comparatively slight injuries affecting the white tract (internal capsule) give rise to motor hemiplegia, not only well-marked, but lasting and often incurable.

Let us trace the cause of these differences. I will first notice the relative intensity of the paralytic symptoms, in cases where the internal capsule has been involved, compared with their feebleness in the case of lesions limited to the grey nuclei; and I will then consider the transitory character of the hemiplegia in instances of lesions of the second class as compared with the persistence of this symptom in affections of the internal capsule.

I.—On the first point, I will once more remind you of some peculiarities in the anatomical constitution of the internal capsule. You remember that it contains: 1. Fibres called *direct peduncular*, because they arise in the cortical grey matter, and pass into the lower layer of the crus cerebri, without being connected with the lenticular or caudate nuclei. 2. It also contains *indirect peduncular* fibres, which take origin from the lenticular or caudate nuclei, and have no relation to the grey cortical matter. We here disregard, for a time, bands of fibres stretching from the grey cortex to the grey central nuclei. We will suppose that the different peduncular fibres, direct as well as indirect, are centrifugal, and that they transmit to the periphery motor influences developed either in the grey cortex or in the lenticular and caudate nuclei.

If this be the case, it is easy to understand that even a slight lesion affecting the internal capsule, especially its lower part (near the foot of the crus cerebri), where all the fibres meet or are gathered in a narrow space, will impair the function both of the grey cortical matter and of the two grey nuclei; while, on the other hand, a lesion affecting only the lenticular nucleus will not interfere with the functions of the nucleus caudatus, or of the grey cortex. It is easy to conceive the different combinations of causes and effects which may arise here—lesion of the nucleus caudatus, of certain regions of the grey cortical matter of the two grey nuclei simultaneously, with or without involvement of the peduncular fibres of the internal capsule. I do not attach more importance to this theory than properly should pertain to it. Still, I may remark that it well adapts itself to clinical observations, and I would add that it is not opposed by experimental researches among animals.

It has long been known that the motor derangements which are produced in most animals by destruction of different parts of the brain (the cerebrum in particular) are, as a rule, widely different from those found in man, in consequence of lesions of the same parts caused by disease. In interpreting these experimental results, and in applying them to human pathology, it is necessary to take account of the animal's position in the scale, and of its age. For instance, removal of the whole of a pigeon's, or snake's, or frog's hemisphere does not cause a motor trouble which can be compared to hemiplegia. And it is much the same in rabbits. Some degree of weakness in the limbs of one side is the only result of such an injury to a rabbit; it can still stand and leap when the cerebrum has been entirely destroyed, provided, in all cases, that the pons is uninjured. In a dog the result is different. In some experiments lately made by MM. Carville and Duret, the results of gradual ablation of parts of the cerebrum much resemble the effects of hæmorrhages into the substance of the cerebral hemispheres in man.

And it is highly probable that the similarity would be

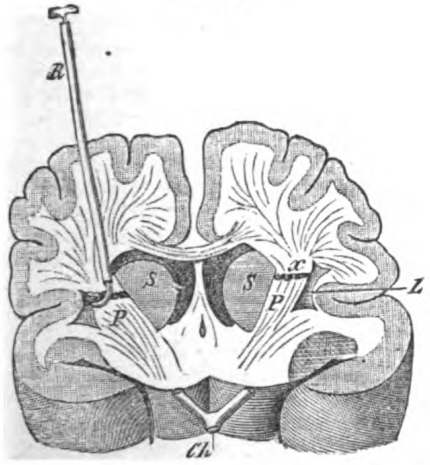
still greater if the experiments were made on the monkey's brain. The principal results of Carville and Duret's experiments are—

1. Ablation of the grey matter of the so-called motor parts of the cortex in the dog causes temporary paralysis in the opposite side of the body.

2. Extirpation of the caudate nucleus causes similar paralysis, but more strongly marked. (At present it is useless to say anything about the lenticular nucleus, because its removal has not yet been effected without injuring other parts.)

3. Lesion of the lower part of the internal capsule causes, in the opposite limbs (anterior and posterior) not only paresis, but well-marked motor paralysis, reminding one of the hemiplegia resulting from hæmorrhage in the same parts in man (fig. 35). Held up by the skin of his

Fig. 35.

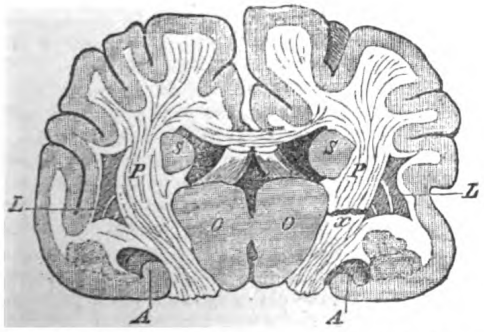


Transverse section of a dog's brain 1-5th inch in front of the optic commissure. SS, the caudate nuclei of the corpora striate: L, Lenticular nucleus; PP, Penduncular expansion (internal capsule); Ch, Optic commissure; x, Section of the internal capsule (anterior or lenticulo-striate region), producing hemiplegia on the opposite side of the body without anæsthesia; R, Veyssières spring stilette for dividing the internal capsule.

back, the animal thus operated on can still rest on his sound limbs, but the affected limbs hang flaccid and incapable of any movements not purely reflex.

To sum up, gentlemen, from these very interesting experiments, which ought to be repeated and multiplied, you see the difference noticed long since between man and the lower animals, as regards the influence of similar regions of the cerebrum on the movement of the limbs of the opposite side. This difference, I say, appears not to exist when comparison is made between animals equally high in the scale of development.

Fig. 36.



Transverse section of a dog's brain at the level of the mamillary tubercles; OO, Optic thalami; SS, Caudate nuclei; PP, Internal capsule, posterior or lenticulo-optic region; AA, Cornua of Ammon; x, Section of the posterior or lenticulo-optic part of the capsule determining hemi-anæsthesia; LL, Lenticular nuclei.

This is the proper place for remarking that, in the dog as in man (according to MM. Carville, Duret, and Veyssierre) lesions of the hinder part of the internal capsule produce crossed hemi-anæsthesia.

(To be continued.)

ON THE PROPRIETY OF IMPOUNDING ORIGINAL PRESCRIPTIONS. (a)

By Mr. R. J. DOWNES, M.P.S.I.

It may appear presuming to suggest a departure from an old established practice which in the past has been found to work sufficiently well not to have been disturbed, yet in these days of reform, innovations need no apology.

There are several questions involved, and naturally the first is: What advantage is to be gained? I think, at least, two; one to the compounder, and the second to the prescriber; and if so, I expect there will be also one to the public.

To the compounder there will be the advantage of holding the prescription in case of accident, indiscreet prescribing, or other cause which might lead to an investigation. It may be argued that such a protection is unnecessary, as the compounder is competent and bound to check the prescription before he acts on it. Not always; for do we not often get prescriptions for Miss ——, who may be any age from 2 to 100 years? or in case of such prescriptions as the following, which I have selected from nineteeen months' experience:—

℞ Acet plumbi, gr. xxxvj.;
Acet morph., gr. iij.;
Acid acet. dil., ℥j.;
Ft. mist. Half a wine-glassful occasionally as required.

℞ Camphoræ pulv.;
Ammon. sesquicarb., āā gr. xviij.;
Vitelli ovi unius;
Chlorodynæ (Dr. J. C. B.) ℥j.;
One sixth part every third hour.

Or one in which an aperient draught is directed to be made up with

Infus sennæ, ad., ℥viij.

We may guess at an error, but are not at liberty to correct. You say, "interview the prescriber," but where will you find him? In one of these cases I was five hours waiting before I could get an answer; and in another the patient had got the prescription when he was on a visit to the country. In these cases I think the compounder is bound to exercise his judgment, and entitled to hold the handwriting of the prescriber as his authority; but let him return a "copy of the prescription as compounded" by him; this copy will, of course, be laid before all prescribers who are in the habit of requiring the last prescription "to be presented on next visit."

Here is the advantage to the prescriber, that he will have a *bonâ fide* check on the compounder; and at the present time, when so many of the profession use the style and manifold-writer, retaining fac-similes of their prescriptions, this would be of great value to them and to us, by giving them confidence in those who were compounding for them, and might also serve as a check on any unqualified who may be compounding, as every registered chemist would be but too ready to have printed headings.

It would be a disadvantage if this rule was only acted on in cases of dangerous or exceptional prescriptions, for to withhold the prescription and give a copy, then would be a slur on the prescriber; but where it is the practice with all prescriptions, no such inference could be drawn.

A difficulty in effecting this is the general opinion that the prescription is the property of the person who pays

(a) A paper read before the Pharmaceutical Society of Ireland.

for it, but it should be defined that the prescription is the prescriber's note to the dispenser, as on the face of it it is, it being written in a language understood by both, and presumably unknown to the patient. The copy, with plain English translation of the directions at foot, answering all the purposes for which the patient can require it, is as much as he ought to demand.

As the Pharmaceutical Sociecy is opening up a new phase in dispensing, I thought our evening meetings would be a fair opportunity of discussing this question, and with this object lay my views before you.

BRITISH MEDICAL ASSOCIATION.

ADDRESS IN MEDICINE.

By HENRY F. A. GOODRIDGE, M.D., F.R.C.P.,
Senior Physician to the Royal United Hospital, Bath.

THE PATHOLOGY OF FEVER.

The etiological aspect of certain specific fevers and febrile processes has so engrossed attention of late, and such encouraging results have attended the study of the same, that inquiries into the essential nature and mechanism of fever in general, pyrexia as it is called, seem in danger of slipping into the background. Yet assuredly the latter are of no less importance than the former. Nay, from the entrance into the organism of the pyrogenic agent to the supervention of convalescence or of death, as the event may be, is not the process, whether longer or shorter, one and indivisible? Light thrown upon the ultimate cause of fever, of course, cannot be too highly valued, whether in reference to prophylaxis or to the part the ultimate may still play in connection with the proximate cause of the disorder. But it is just in this latter sphere that light is as urgently needed; for how can we, as practitioners of medicine, ever expect to get control over the febrile process as a whole, or how can we be justified in affirming, except provisionally, that it is *beyond* our control, while we are so little advanced in our knowledge of it that authorities among us are divided, not alone as to what extent, or as to the particular way in which the great nervous system of the body is concerned in its pathogenesis, but as to whether it has any share in it at all? Some two or three years ago, I was led to inquire a little into the existing state of this department of pathology, and I ventured to place the result before our local branch. In endeavouring now to execute the task with which I have had the honour to be entrusted, I propose to resume the subject, and to invite attention to certain work done in connection therewith since the period referred to; premising, however, that I have no discoveries, no laboratory researches, of my own to offer, corresponding to those with which my accomplished predecessor last year interested his auditory at Manchester.

But, before proceeding, I cannot forbear to allude to the loss to scientific medicine recently of two men whose names must ever be associated with the history of fever pathology. In September last died Carl August Wunderlich, the father, as he has been called, of clinical thermometry; that is to say, that, although he was somewhat anticipated by De Haen, and yet more considerably by Gavarret and Zimmermann, to Wunderlich must always be ascribed the distinguished merit of having fully established the great practical value of the thermometer and of temperature observations for clinical purposes. With the employment of this instrument for the determination of the body heat, I need hardly say, the history of modern fever doctrine must be considered to commence; for we have with it the first application of the methods of exact inquiry to investigations concerning the essence of fever. Wunderlich sank after protracted illness; not so, however, the eminent French physiologist Claude Bernard, who, four months later, was cut off suddenly, and in the midst of his work. My personal recollections of him, largely exceeded, no doubt, by those of many here present, are limited to the time when, as prosector to Magendie at the Collége de France, he was engaged *inter alia* in demonstrating the functions of the roots of the spinal nerves. His brilliant career had as yet hardly dawned, and experimental physiology, it is unnecessary to observe, was then in its infancy. To tell of Bernard's discoveries and researches were a task itself; we need it not; we are all more or less familiar with them. We know, moreover, how vast an influence they have exercised upon modern pathology and medicine; but, perhaps, nowhere more strikingly so than in the department with which we are just now concerned. Indeed, there is not a modern theory of fever that has been set up, unless it absolutely exclude the nervous system from all place in it, in which Bernard's work is not the very keystone of the arch. So, also, frequent reference to the same in anything said upon the subject, just as to physiology generally in dealing with the complicated phenomena of fever and the peculiar alteration of the heat economy of the body which we meet with in it, becomes indispensable.

The first matter to engage us, then, is the share of the musculature in the production of the body-heat. As soon as it was known that the combustion processes of the body upon which, as Lavoisier taught, its proper heat is dependant had not, as was imagined, their especial seat in the lungs, but took place in the tissues generally, it became manifest that the share respectively of these different tissues in the main result must be very unequal. In some, much heat would be produced; in others, little or even none; and in the same tissue a very varying amount at different times. Clearly, the product in a given time would be in direct proportion, on the one hand, to the quantity of tissue relatively to the entire body-weight; and, on the other, to the energy of the oxidation processes occurring in it, or, in other words, to the amount of its nutritive and functional activity. Thus regarded, the glandular organs, the great nervous centres, and the muscular tissue might well be assumed to take a prominent part in the production of heat. The results of observation and experiment show this. The secretion flowing from the salivary glands has been found to be 1·5 deg. Cent. hotter than the arterial blood supplying them. A similar augmentation of temperature in the secretion of other glands, though not hitherto proved, is highly probable. The liver we know to be a great focus of heat; indeed, Bernard maintained that it is the organ which has the highest temperature of any, but this has also been claimed for the cerebrum proper. In regard to the latter, at all events, the blood of the jugular vein has been found to have a higher temperature than that of the carotid artery. To come now to the muscles. They constitute in weight nearly half the body, and a third of the blood outside the heart and great vessels goes to their supply. We have long had much evidence to show that the musculature is a great generator of heat; numerous observations in man and animals testify to the fact. But Professor Samuel, of Königsberg, has recently succeeded in more precisely proving its influence upon the temperature of the body, by eliminating a great portion of it from the total heat production. He tied in a healthy rabbit the two subclavian and two femoral arteries, and then placed the animal in an atmosphere of zero Cent., or lower. The result was, that its temperature fell gradually within, from four to eight hours, to 72 deg. Fahr. and under, and it died with all the signs of infrigidation. In another rabbit, he made section of the cervical plexuses and of the sciatic and crural nerves without tying any vessels, and, placing it in the same cold medium, exactly the same result ensued. The two operations combined in one and the same animal did not exceed in effect that of either alone. The wounds necessarily inflicted were found to have no important share in the result. By immersion in ice-water, Samuel could

reduced the temperature of small healthy rabbits some degrees, and they endured this abstraction of heat, even with similar wounds, a very long time ; but when rabbits of whose extremities the main arteries were ligatured or the nerve-trunks divided, were immersed in ice-water, their temperature sank rapidly, and death ensued. If the animals thus experimented on were placed in a warm atmosphere, they passed into a febrile temperature, even to 107 deg. Fahr. and upwards, which, however, as soon as the heat-discharge, as by cool environment, was again facilitated, sank in a like manner as when they were exposed to the same after the operation. Here, then, by eliminating from the total heat-production the musculature of the extremities, the warm-blooded animal is reduced to the condition of a cold-blooded one, its body heat being now no longer stable, but rising and falling with the external temperature ; and all the heat producing powers of the glandular organs, nervous centres, &c., do not avail to prevent this result. But, remarks Samuel, the musculature of the extremities is in mass only about a third of the entire musculature of the body. Hence he concludes that the musculature is the great source of heat, and that the heat-production of all other organs taken together is comparatively inconsiderable.

Now, as to the condition of the muscle concerned in this thermogenic process, Claude Bernard found that the consumption of oxygen in a muscle in a state of contraction approached half the quantity contained in the arterial blood supplied to it ; in a muscle at rest, the consumption amounted to nearly a third of the same, and the proportion of carbonic acid in the venous blood, though less, of course, than that of the contracting muscle, was still considerable ; while, in a muscle paralysed from section of its nerve, the consumption of oxygen was nearly, and the production of carbonic acid, was quite *nil ;* the blood flowed through the muscle almost unaltered. The colour of the venous blood, indeed, so far allowed these differences to be recognised. That the paralysed muscle was almost as red as the arterial ; the blood issuing from the muscle at rest was moderately black, and from the contracting muscle intensely black. It is thus evident that the repose of muscle is not a state of inertia, of entire inactivity, as after section of the nerve. Bernard held that the elementary fibre is in a condition of semi-contraction, answering to the "muscular tonus" of some physiologists. Be this as it may, it is clear that there is at least a combustion-process going on in the resting muscle, which, in contrast to the intermitting character of voluntary muscular activity, is continuous and unceasing. The inference from the whole drawn by Samuel is, that the musculature at rest constitutes the silent heat-apparatus of the organism, the "local hearth" of the combustion processes of the body, which Crawford, Priestley, and Lavoisier, assigned to the lungs. In close correspondence are the results of curare-poisoning, which we know paralyses the muscular nerves. Röhrig and Zuntz found in curarised animals a marked diminution, as indicated by the quantities of oxygen consumed and carbonic acid produced ; these, indeed, might fall to half the normal. At the same time, the body-temperature sank considerably ; and this sinking was the effect, and not the cause, the diminution of the oxidation was shown by the fact that the latter continued to diminish when loss of heat from the body be prevented by wrappings of cotton wool. Similar, again, is the conclusion to which, *inter alia*, Fick and Harteneck have been led by their recent researches on the development of heat in muscular contraction : "The combustion of the nutritive materials taken up by the body," say they, "so far as the affinity of the inspired oxygen does positive chemical work therein, proceeds almost exclusively in the muscular tissue." What is to be said respecting the nervous influences concerned in this process, will appear as we proceed.

Our next topic is the mechanism of the heat-regulation, still a physiological one, but so intimately connected with the pathology of fever as to require a few moments devoted to it.

In our endeavours to explain this remarkable endowment of the warm-blooded animal, by virtue of which it maintains constant its proper heat, notwithstanding varying external conditions of temperature, and ever tends to return to it, even after considerable alterations of the same, we have been in the habit of assuming the existence of an encephalic nervous centre, to whose mysterious operation the whole was attributed ; but, if it be established that the musculature is the main seat of the production of heat, there are certain considerations which, taken together, seem much to favour the belief that this regulation, although very possibly subject to the influence, inhibitory or otherwise, of a higher centre, is in the main effected by means of ordinary reflex machinery having its central elements in the spinal cord. It will be observed that the question is, not how originally we derived our normal body-temperature—*that* we inherited from the maternal organism—but how it is maintained constant.

First, then, the law that cold contracts the vessels and heat relaxes or dilates them is, of course, paramount here ; the full extent and exact application of it, however, are apt to be overlooked. Assuming a certain degree of contraction of vessels to correspond to the mean normal temperature of the body, then, it is clear, every influence which proceeds from a lower temperature is, *pro tanto*, cold ; likewise every influence proceeding from a higher one is, *pro tanto*, heat ; and, therefore, in the two cases respectively, *quoad* contraction, so much stimulus or the reverse.

Secondly, the contraction state of the vessels, we know, regulates the heat discharge from the surface of the body ; but the quantity of blood to circulate remaining the same, the degree of contraction of the vessels will depend upon the thermal influences of the entire environment, and therefore, as has been well pointed out, at least as much upon the temperature of the interior of the body as upon that of the external surrounding, and the amount of heat-loss connected with the latter.

Thirdly, in the contraction of vessels produced by it, we recognise that cold acts as a stimulus to the sympathetic vaso-motor nerves, and brings to pass an activity of their proper musculature. The sympathetic system, then, governs the vessels which regulate the discharge of heat ; and cold restrains that discharge.

Fourthly, under the influence of cold, increased heat-production takes place, as determined calorimetrically, and by the amount of carbonic acid excreted ; with increase of the cold, the heat-production increases, unless it be carried to an extreme ; and with decrease of the same, the heat-production decreases. The chief seat of the heat-production we assume to be in the muscles. We know the skin to be the principal sensory apparatus of the body, and further that cold is felt by the cerebro-spinal sensory nerve-endings of the skin and subcutaneous tissues, considerable operation of it amounting to pain, but that it is not, therefore, to be regarded as inoperative when its impressions fail to reach the sphere of consciousness. Röhrig and Zuntz found that stimulating saline solutions applied to the skin were able to increase the heat-production, and other observers got a similar result from other cutaneous stimulants. Can we avoid the inference that the skin and muscles are correlated in the heat-economy of the organism, and that cold, meaning thereby any influence by which heat is drawn from the body, is that stimulus, which, acting upon the terminations of the sensory (afferent) nerves of the skin and immediately subjacent structures, serves to maintain in a reflex way, possibly enough in conjunction with other influences, a permanent activity of the musculature ? To assume that the reflex ganglionic centres are situated in the spinal cord, and, moreover, that they have an intimate connection one with another, seems only according to analogy ; while, as to the (efferent) nerves to the muscles, whether they be ordinary motor nerves, as Bernard's view would suggest, or nervous fibres more directly connected with the production of heat, dilator nerves, trophic nerves, &c. ; nay, further, whether peripheral autonomic centres play any part in the process—

are just so many points on which, it may be hoped, physiologists ere long will be able to inform us.

If we take now these several considerations together, does it not appear that we have all the elements of a heat-regulating mechanism? The normal body temperature given, with the restraint of the heat-discharge and the increase of the heat production, as they are both determined by the operation of the stimulus of cold, the heat-discharge, however, being influenced by the temperature of the body, as well as by that of the surrounding medium, are not the requirements of the case potentially satisfied?

(To be continued.)

Clinical Records.

ST. MARY'S HOSPITAL.

Hard Cancer of the Female Breast.—Cancer in the Axilla.

Under the care of Mr. HAYNES WALTON.
Surgeon to St. Mary's Hospital, &c.

A FEMALE, æt. 38, was brought into the operating theatre, July 17th, with hard cancer of the breast, and so advanced that it was partially adherent to the skin, which was slightly ulcerated. One enlarged gland only existed in the axilla. It was only nine months ago that the breast tumour was noticed. The patient did not know that the axilla was affected. Mr. Walton operated. After he had removed the breast and the cancerous axillary gland, he made the following remarks :—

Notwithstanding the tendency of hard cancer to return, a longer immunity may be insured by more efficient operating than that which is commonly practised. There can be no efficient operating which does not entirely remove the breast tumour, to accomplish which, the greater portion of the mammary skin, the nipple, the entire mammary gland, and the pectoral fascia beneath must be taken away. Nothing short of this can give any chance of the best results which an operation can afford. The disadvantages of the slow granulating of a necessarily large wound, are not to be considered under the circumstances in question. The travelling of the cancer to the surface, by which the skin is involved in ulceration, should not deter operating so long as the ulceration is limited, and the skin around is not infiltrated with cancer beyond the gland boundary, and the gland is not adherent to the pectoral muscle. The cancer can never be sufficiently removed where the gland is only partially excised. To remove only a part of it is to deprive patients of years of life.

Efficient operating involves, too, the removal of any cancer glands from the axilla. Surgeons of the old school objected to operate for mammary cancer when the axillary glands were implicated. The late Mr. Liston said that a surgeon who would operate under such conditions must be grossly ignorant, atrociously unprincipled, or of unsound mind. Indeed, some living surgeons think as he did, of which I have just had an example in private practice. A more favourable case, as far as the mamma was concerned, for operating on I never saw ; but because one gland in the axilla was affected, did a surgeon of high repute in London object to interference, and his great name has caused his opinion to be accepted, with, of course, terrible disadvantages to the suffering lady. There is a degree of axillary implication—as for instance, when the cancerous glands are numerous and much adherent—which forbids any exercise of practical surgery. But more may be done by operation, and with successful issues, where many glands are affected, than is generally supposed, if the surgeon thoroughly knows his work, and has hands to execute it well. It may be necessary even to cut across the pectoral muscles, to clear the axilla sufficiently.

Mr. Walton also noticed briefly the development of secondary cancer, that is the return of cancer, in and about the wound on the breast, and the secondary implication of axillary glands. He advocated the early removal of such secondary growth, and the repetition of the operation, should the cancer return, again and again. He alluded to many instances in private and public practice, in which patients so treated were alive and apparently well, although several years had elapsed since cancer had first appeared in the breast.

Special Reports.

THE PROPHYLAXIS OF INFECTIOUS AND CONTAGIOUS DISEASE.

ABSTRACT OF A REPORT ON THE TRANSMISSIBLE DISEASES, WHICH REQUIRE ISOLATION, EITHER IN GENERAL OR SPECIAL HOSPITALS, AND ON THE MEANS OF RECONCILING THIS ISOLATION WITH THE CONDITIONS AND REQUIREMENTS OF HOSPITAL ADMINISTRATION.

Made in the name of a Commission composed of

MM. FAUVEL, LEJOUEST, LEON COLIN, LE ROY DE MERICOURT, MARIE DAVY, MICHEL MISING, PINARD, ROCHARD, TARNIER, VALLIN, VADAL, VIOLET LE DUC,

By MM. FAUVEL, AND VALLIN.

STATE OF THE QUESTION.

As certain affections are transmissible it is evident isolation is a necessity for the benefit of the patient and society.

Practically, ideal isolation is unattainable ; it generally consists at present of the grouping, reunion, or conglomeration of patients, separated from the community. Transmissible affections vary in degree and gravity, and thus the field for inquiry is very wide.

Leaving speculation, the question has been narrowed down to a practical issue, apart from theoretical and doctrinal ideas, How can we carry out isolation practically in our hospitals in the present state of our knowledge and our municipal and sanitary organisation?

The method adopted in many of our hospitals of the present day is simply deplorable. Patients with the most varied complaints are placed together in the same wards, and too often a variolous patient transmits his affection to a convalescent from typhoid fever or pneumonia between whom he is placed.

In 1878, at Paris, infectious cases are still treated in the common wards. A child may be admitted for slight ophthalmia ; in the course of treatment it contracts diphtheria, and after having successfully undergone tracheotomy, succumbs later on to measles or scarlatina.

The necessity of the isolation of these special diseases has been eloquently insisted on, not only in France but in Germany and England. The principle is admitted by the whole world. Why then in so many of our large towns are the measures for isolation so imperfect? Is it because the surest, most advantageous, and easiest method of practically carrrying it out is not yet known. This question must be solved before deciding on the construction of new institutions, before modifying the present hospital system. This Congress affords a fitting opportunity for the discussion of this question. The united efforts of the *savants* of Europe cannot fail in removing from our hospitals a condition of things unworthy of our present civilisation, unworthy of a time when international exhibitions offer us periodic testimony of the progress realised in every branch of human knowledge.

What diseases should be isolated?

We must place in the first group *eruptive fevers*, as small-pox, scarlatina and measles.

Diphtheria.

The necessity for the isolation of these four diseases is universally recognised. In the second group *typhic affections* may be placed. *Petechial typhus* is almost entirely unknown in France, but in Germany, England, and Russia the disease is permanent and common. Its epidemics are serious and frequent, its transmissibility proved, and after variola it holds the first rank amongst diseases requiring isolation. We may also include *recurrent typhus.*

Without disputing the transmissibility of *typhoid fever*, yet

such an occurrence is extremely rare in hospitals. Louis and Chomel only remember three or four cases of contagion during their long practice in the Paris hospitals. Murchison (*a*) states that during nine years 3,555 typhoid patients were treated in the London fever hospital, in the midst of 5,144 patients suffering from diseases of specific character, without any bad result. Liebermeister has noted 45 cases occurring within an hospital, where 1,900 cases of typhoid fever were treated. Out of 400 typhoid patients treated at the military hospital of Val de Grâce in 1875-76 ten may be considered as arising within the hospital.

The opinion of French physicians is unanimous on the rarity of the extension of the disease. (*b*)

It does not, then, appear necessary in hospitals to separate typhoid patients from the other occupants. But, besides the special question of hospital hygiene there is another of general interest. For some years there has been a tendency to replace admissions to hospitals by attendance at patients' homes. When typhoid fever develops in an unhealthy house, an over-crowded lodging, in the midst of bad hygienic arrangement, it often forms a morbid centre, the activity of which increases with the number of persons attacked. Epidemics of this kind are not rare, and their progress is difficult of arrest. By the immediate isolation of the first patients in an hospital, followed by local sanitary measures, such epidemics might be stamped out. In England, seemingly with this object, patients suffering from typhoid fever are isolated in fever hospitals, though they are placed in wards common to other patients.

May we, then, adopt the following proposition?

Typhoid fever patients should be isolated from the general population, and not treated at their homes; but it is not necessary to separate them in hospitals from the general occupants.

We may next consider whooping-cough. When it is simple it is not a sufficient cause for admission to a children's hospital. But it may be complicated with broncho-pneumonia, or another disease, as an eruptive fever, scrofula, &c. Should the patient be isolated? In principle we may answer in the affirmative. M. E. Vidal (*c*) informs us that in the Children's Hospital, St. Petersburg, an isolated ward is devoted to whooping-cough.

From a practical point of view it is important not to multiply the diseases requiring isolation.

We shall next consider that

Parasitic Affections of the Skin, Purulent and Granular Ophthalmia require more precautionary measures than actual rigorous isolation. For parasitic affections, and for granular conjunctivitis, domiciliary care and medical advice are necessary.

Surgical affections, another important class, may be divided into three groups—

1. When there is no solution of continuity.
2. When there is solution of continuity.
3. When we have to deal with purulent infective erysipelas (*d*), hospital gangrene, &c.

Isolation is necessary for the third group, but it is not sufficient. It must be supplemented by rigorous individual hygiene.

The various *puerperal conditions* in which isolation is required may be placed, as regards importance, along with surgical septicæmia. Rigorous isolation is of the utmost importance in such diseases.

Though cholera rarely appears we must mention it. Isolation in this plague is now placed almost beyond dispute; and before an epidemic occurs it is well that the question should be studied.

We must lastly consider syphilis, phthisis, and dysentery.

Syphilitic patients are generally treated in special wards or distinct hospitals, more on account of order and discipline than for fear of the propagation of the disorder to others. This custom need not be changed.

On the shores of the Mediterranean, and particularly in Italy, phthisical patients are placed in special wards. During their life and after death they are the objects of certain measures of prophylaxis and disinfection. The modern works of Villimen and other observers afford a scientific foundation for customs, which for a long time rested only on popular prejudices. In the actual state of the question the isolation of such patients does not seem necessary; but it would be interesting to know whether the custom adopted in Italy is justified by the alleged facts of the transmission of phthisis.

Opinions are very much divided on the contagious nature of dysentery. In Holland, dysentery is classified amongst the transmissible infectious maladies, but unless under exceptional circumstances isolation is not demanded for this disease in Europeen hospitals.

We have passed in review the majority of diseases for which isolation may be claimed; but we believe this list should be rather curtailed than extended. At present, it would be unwise to aim at perfection, which must be the work of time and experience.

We must limit our reforms, and therefore demand isolation for the following diseases, either in special wards or separate hospitals:—

1. Eruptive fevers—variola, scarlatina, measles.
2. Diphtheria.
3. Petechial typhus, and recurrent typhus.
4. Transmissible puerperal affections.
5. Certain accidental epidemics, cholera.

THE MEETING OF THE BRITISH MEDICAL ASSOCIATION AT BATH.

The Forty-sixth Annual Meeting of this large and flourishing Association was held at Bath, last week, under the Presidency of Dr. Wilbraham Falconer, one of the oldest members of the Association, and for long its respected Treasurer. Dr. Falconer's personal influence was in itself sufficient to attract a large gathering, and though the meeting will not compare in numbers with some of the very large recent annual meetings of the Association, still it must be regarded as decidedly a success.

The meeting commenced, as is its wont, with attendance upon Divine service, which was held in the Abbey, the Mayor and Corporation attending the service. The sermon was preached by the Bishop of Bath and Wells, from the text, "I will praise thee, for I am fearfully and wonderfully made." He dilated upon the wonderful mechanism of the human body; yet in spite of the researches of the microscope, and of organic chemistry, we could not yet answer the question, "What is life?" He went on to say that he ventured to charge those whom he was addressing to rise to a full responsibility of what he must call "their sacred office." The influence which the medical profession could exercise in consequence of their knowledge and the nature of their calling was immense, and with the magnitude of their influence so was their responsibility. Yet if the paths of science were to be trodden boldly, still it was meet that they be trodden reverently. He concluded by a well turned peroration on the duty of the created to their Creator. A collection was made at the close for the British Medical Benevolent Fund.

In the evening, the first general meeting was held in the Assembly Rooms. In consequence of the recent death of

Dr. Eason Wilkinson, of Manchester, the retiring President of the Association, the chair was taken by Dr. Husband, of York, the present Treasurer. A resolution indicative of the sympathy of the Association, with Dr. Wilkinson's bereaved family, was passed unanimously. Then Mr. Watkin Williams, of Birmingham, proposed, and Dr. Phillipson, of Newcastle-on-Tyne, seconded the proposition that Dr. Falconer be President: this was carried with acclamation. Dr. Falconer then proceeded to deliver his address. He said that thirty years ago, the Association then bearing the name of "the Provincial Medical and Surgical Association," had held its meeting at Bath. But of those who held a prominent position, there were but few here now to welcome the third meeting of the Association in that city. Thirty years ago the meeting occupied but two days; now its business could scarcely be transacted in six. Then there were but 1,300 or 1,400 members, now it counted 7,500. He then referred to the growth of the Association, pointing out that this year a colonial branch had been started in Jamaica. The Association had too its Registration of Diseases Committee, whose reports were of great interest. The Association had granted sums of money for scientific research, and the work of the late Prof. J. Hughes Bennett on the action of mercury, and the antagonism of remedies had become widely known, and had led to other similar work. In 1874, a Scientific Grants Committee had been instituted, and the investigations of Profs. Rutherford and McKendrick, of Drs. Braidwood and Bacher, and of Dr. Milner Fothergill had already appeared in the Association's Journal. Recently a sum of £100 had been voted for the investigation of hydrophobia. Recently, Dr. Middlemore, of Birmingham, had given £500, the interest of which was to be awarded triennially for the best essay on the advance of ophthalmic medicine and surgery. He then went on to speak of the position of the city of Bath, and of its water supply. The usual stock matter of these presidential addresses, the water supply, the death-rate, the rainfall were then related; after which he spoke of the mineral waters which had made Bath famous. There were remains of Roman baths, and other edifices in the neighbourhood of the springs. One of these baths was two hundred and forty feet long, by over hundred and twenty broad, which was highly decorated with tesselated pavement, columns and pilasters. In the year 675, Osric visited its hot springs, and founded a monastery. In the twelfth century, the Bishop of Bath and Wells founded baths, and also a hospital for lepers. In the last century, Bath became famous, and now there are bath rooms and pump rooms, and a mineral-water hospital. The volume of water discharged daily was 181,440 gallons. The hot-water spring has a temperature of 120° F., the King's Bath 117°, and that of the Cross Bath 108°. The outflow is not affected by rain or drought. The solid contents of these waters amount to no less than 420 tons in a year. When the waters are drunk direct from the springs they raise the pulse and temperature, and excite the secretions. When their free use produces nausea, it was well to diminish the quantity taken. It was well to drink them twice a day, before breakfast and in the afternoon. They were of great efficacy in gout, and the warm baths often brought out "latent gout" in a beneficial manner. Where deposits were forming, and in "atonic gout" they were very useful. In acute gout the waters were inadmissible. In rheumatism they were of the greatest benefit, often achieving a cure when all other treatment have failed. Palsy was benefited by them. (A picture in the mineral-water hospital shows two eminent Bath worthies of a by past time attending the paralysed, the rheumatic, and a boy with leprosy). He then welcomed the Association to Bath.

Mr. Francis Fowke, the General Secretary, then read the annual report and financial statement, which was of the most satisfactory character. The surplus of the year consisted of £3,000 in Consols, and £2,193 in cash at the

The baths were placed at the service of the members of the Association at certain hours on presentation of their tickets. The pump-room is a handsome room with a free flow of warm clear water, of not very pleasant taste, and of too high a temperature to constitute a pleasant beverage, but eminently calculated to flush and wash out the tissues when taken in the morning fasting. Further, they are scarcely appetising, and the conviction is forced upon one that the waters and the regimen enforced while drinking them were eminently calculated to effect the removal of the excessive nitrogenised waste which lies at the bottom of most, or at least many, of the maladies for which patients come to drink the Bath waters. The treatment could not, however, have been pleasant in itself, irrespective of its effects.

On Wednesday morning a meeting of the members of council was held, and it was determined that the invitation from Cork should be accepted for the next meeting. It is eleven years since the Association visited the sister isle, and the prospect of renewing the acquaintance was evidently acceptable to the members of the Association. Dr. O'Connor, Professor of Medicine in Queen's College, Cork, was elected President. After this the Address in Medicine was delivered in the Assembly Hall by Dr. Goodridge, Senior Physician to the Royal United Hospital at Bath. He referred to the heat-forming and heat-regulating processes of the body, and then reviewed the clinical phenomena of fever. He held that much of the rise of temperature was brought about in the muscles. After describing the experimental study of fever, he discussed the cause of fever as to the method of fever germs. He thought our present knowledge of the origin of fevers was very unsatisfactory; and he hoped that ere long we should be in a much better position, not only as regards knowledge of how fevers were brought about, but also as to how to control the pyretic processes, and so influence the progress of the case beneficially.

A vote of thanks was then proposed by Prof. Maclagan, of Edinburgh, and seconded by Dr. Fox.

A meeting of the Poor-law Medical Officers was held, and was presided over by Dr. Rogers. The question of remuneration and the matter of extras occupied the chief attention of the meeting.

In the Medicine Section the President, Dr. Grainger Stewart, Professor of Medicine in the University of Edinburgh, delivered an address of a retrospective nature, speaking of the illustrious men who had occupied that position before him. Several papers were read by Jonathan Hutchinson, Dr. Fox, and others, as to the diagnosis and treatment of intestinal obstruction, after which followed a discussion. For several years past now it has been the practice to discuss some special subject, with the view of eliciting all that is known about it up to the most recent date. In this discussion the chief question raised was the propriety of surgical interference in intestinal obstruction, not only for the purpose of putting the bowel right in cases of ileus, or twist of the large intestine, but of exploratory incisions to see what the nature of an obstruction may be, and as to how far it may be possible to afford relief by Amussat's, or even Littre's, operation. Dr. Gowers then read an *ad interim* report from the Hydrophobia Committee, giving an account of several cases of that terrible disease, as well as of rabies in the dog.

In the Surgical Section Mr. Callender presided, and delivered an address, after which Mr. W. Adams, of London, read a paper on "Subcutaneous Division of the Neck of the Thigh-bone." He was followed by Mr. Edmund Owen, with a paper on "The Anatomy of Hip-joint Disease in Children." Mr. Wm. Stokes contributed a paper on "Extension Apparatus for the Treatment of Fractures and Certain Deformities of the Lower Extremities." Dr. J. MacNaughton Jones read an account of "The Results of Treatment of Spinal Curvature (in Fifty Cases) by the Plaster Jacket and Suspension." The adoption of this plan, so ably advocated and so splendidly demonstrated by Dr. Lewis Sayre, of New York, at the

annual meeting (in Manchester) last year, is now general, and the results attained gratifying alike to the patient and the surgeon. He followed this account by some remarks on "Morbus Coxarum," showing a specimen with dislocation of the epiphysis of the femoral head.

In the Obstetric Section the chair was taken by Dr. McClintock, of Dublin, who in his opening address, dealt with the subject of deaths in child-bed. Mr. Grace then gave some interesting details of long practice extending over twenty years. Dr. C. H. F. Routh, then described the different forms of intra-uterine pessaries in common use. He was followed by Dr. J. G. Swayne, who discussed the effects of forceps delivery upon the fœtus.

In the Public Medicine Section the President was Dr. Arlidge, of Stoke-on-Trent, where a paper was read by Mr. North, "On the Registration of Disease;" which was followed by a paper by Dr. J. Seaton, on "the Compulsory Notification of Disease." The views taken by these gentleman being somewhat conflicting, Dr. Notter followed by a paper "On the Purification of Water by Fltration."

In the Physiological Section Prof. McKendrick presided, and attracted much attention by his introductory address on "Physiological Acoustics." He described a noise as differing from a musical tone, the musical tone being the result of equal and regular impulses upon the ear, occurring sufficiently frequently in time. This he demonstrated by the use of Helmholtz's syren. He showed by means of flames the effect of a musical note upon them, each flame answering to its own note, and being broken up into a series of tongues of flame as demonstrated by the revolving mirror. The ear, he showed, had the power of discriminating the tones of a certain pitch, it was held by means of bristles in the organs of Corti. Dr. McKendrick illustrated what he had to say by different instruments, and it is impossible to describe in writing the beautiful illustrative experiments, and the skill with which the manipulation was executed, so that the desired result was invariably attained. So satisfactory was the demonstration, that Prof. McKendrick was induced to repeat it next day, for the benefit of those who missed the first opportunity.

After the sections had closed local excursions to the different places to Bath, from which magnificent views could be obtained, were made, but a severe thunderstorm coming on, spoiled the pleasure which they would otherwise have experienced. In the evening, a soirée, given by the Mayor and citizens of Bath, was held at the Assembly Rooms, and was largely attended by the visitors and the people of the neighbourhood. Of course the telephone was there manipulated by Mr. J. D. Cogan; while the phonograph attracted a large number of auditors, and behaved itself in a creditable manner. There were a large number of drawings, especially of Bath in the olden time, exhibited; and other objects of interest, including portraits of deceased Bath medical worthies. There were also geological specimens and sections; and some excellent music.

Apartments have been prepared in Trinity College, Dublin, for the reception of the various sections of the British Association, and all arrangements are now nearly perfected. Festivities in various parts are now being organised, among them a series of excursions. One of them will be to Carton, Maynooth, the seat of the Duke of Leinster, where the visitors will be entertained, and the Earl of Meath will receive another party at Bray.

Dr. Mackintosh, medical officer of health for the Chesterfield union, has reported that scarlet fever is rapidly increasing in certain parts of that district. He attributes the spread of fever in many instances to the fact of relatives recklessly attending the funeral of persons who have died from infectious disease.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 14, 1878.

THE BRITISH MEDICAL ASSOCIATION.

The annual event of medicine—the meeting of the Association—has come off at Bath, with several special results, which give it individuality. In the first place a vigorous attempt has been made to rescue English waters from the neglect and obscurity into which they have fallen in recent years. At one time it was the fashionable thing to visit Bath to drink the waters, and the *elite* of society were to be found in the large and spacious pump room, sipping a fluid hot enough to be unpleasant to the hand. In addition to the advantages which arise from bathing the tissues of the body by draughts of water taken in the early morning fasting, these waters act pronouncedly upon the secretions, and especially upon the intestinal canal and the kidneys. But whatever their virtues Bath waters can never become popular as a beverage. Some of the water, ærated and in bottles, of the peculiar Seltzer water character, was put down for the inquiring visitor, and some of it was drank, but apparently without exciting much enthusiasm in the bibulous individual. This distinct attempt at utilising the meeting from a business point of view will probably find its reward in increasing somewhat the revenue derived from this spring; but it may be questioned whether patriotism will ever succeed in making Bath water popular. This spasmodic effort may start some permanent movement in the direction of the general use of Bath water, but it seems only too certain that the chief advantages to be derived from this spring are the pleasant character of the water for the purposes of the bath, and the society which has gathered around the

spring. Bath gives the impression of respectability in its sombre terraces, its solid stone houses, and the marble tablets of its Abbey. It bears upon its face the evidence of staidness; you feel that the great motor force of the place lies, thinly veiled from sight, in the decorous and pious ladies who inhabit these serious looking tenements. There is religious gravity in the air, just as there is moisture in the atmosphere. The whole place seems pervaded by a compound of religion blended with low-spiritedness; indeed, that state of mind which is evolved by a low barometric pressure in persons of correct principles and feelings. This has gone on through many generations until a distinct character is given to the city. The profession have caught something of this, and give the impression that there the doctor carries with him not only the care of his patient's temporal interests but also a weight of responsibility as to their spiritual welfare. This moral atmosphere is doubtless as attractive as the waters, and the two together will probably continue to be as seductive to certain persons, especially of the feminine sex, in the future as it has been in the past. It was quite superfluous to attempt to make the meeting a means of increasing the demand for the waters. The profession there need be under no alarm that they will suffer pecuniary loss from such attempt; they are saved by the forces which have just been alluded to, from any possibility of the influx of patients being checked or another direction being given to the wealth-bringing stream. The persons who wend their way to Bath are not likely to be diverted to the lighter and more frivolous society which congregates at Homburg or at Aix-la-Chapelle. If the denizens of Bath had been as keenly alive to their interests as they might be, they would have made the most of this, and through the means of this great medical gathering have spread far and wide the impression that Bath is essentially pious, and that it has the best founded claims imaginable to be regarded as "the religious watering place."

Consequently it seems specially unfortunate that this city, whose very backbone is feminine earnestness, should have been selected to test the feeling of the profession at large, and the members of the Association in particular, as to that peculiar manifestation of female earnestness, the medical woman question. The adverse decision arrived at as regards the admission of the softer sex to the privileges of the membership of the Association,—whatever they may be—came with a singularly bad grace from this city of the sex. That the country party of the profession would vote solid, as an American puts it, on this question was clear from the first; it was a foregone conclusion, not to be influenced even by the able pleading of Mrs. Garret Anderson, and the feeling of respect which everyone has for her individually. The result does not seem to have been arrived at as a consequence of the arguments used by the speakers, so far as their speeches at least are concerned; but has evidently rested on some sentiment. Even the speakers against the admission do not seem to have hinted at any intellectual deficiency in woman, any defect of character, which should debar her from the membership f the British Medical Association. The thing has a distinctly comical aspect. What advantage would accrue to the female aspirants for admission—for aspirants there must be else, or why should the thing be mooted at all—it is impossible to see? What is their grievance that they are not admitted? The value of the thing is entirely fictitious, and the ladies may be congratulated in not having the opportunity afforded of being bored by a polite attendance upon dreary reports of committees, and from that still more terrible infliction, the after dinner speeches of the annual banquet. Instead of the membership being something to hanker after, they ought to feel how truly considerate, even if unintentionally so, was the action of that majority which kept them away from such social inflictions. Whether the medical woman question has or has not that vitality in it with which Mrs. Anderson credits it, it is quite certain that it will not be influenced either one way or another by the conclusion arrived at the other day in the Somersetshire watering place.

There was another point about the meeting which is significant; we refer to the absence of the *conversazione* which has for years past now been given by the President. This evidently was in no way to be ascribed to any want of willingness or of means on the part of the present president; but must be looked at as indicating a change to be inaugurated. The last meetings of the Association have been very costly; so much so, indeed, that but a limited number of towns could afford it. And what is true of communities, holds good of individuals, and few of our hard-worked and ill-paid profession could afford the expenditure of recent years. The annual meeting of the Association has largely lost its distinctive features as a meeting of workers to exchange views, and become a social gathering; doubtless, enjoyable enough, but so costly that its presence is burdensome.

Bath, however, has set an example, and taken the first step in a new direction. The President's *conversazione* is no more, and the lavish hospitality of the Northern towns has not been imitated in the West. This self-denial is the more praiseworthy, as it was evidently the interest of the President and the local practitioners to have acted otherwise, especially as they have in other ways indicated that they wished the presence of the Association to exercise a permanent influence of a beneficial character upon the future interests of their city. Probably it is intended that the large surplus revenue of the Association now remaining after all expenses are paid, shall in the future be made to contribute towards the annual entertainment.

We fancy that for the bulk of the members they would like to feel that to some extent they were their own hosts; and that the hospitality which is extended to them was not pressing too severely upon their entertainers. Probably if the Committee of the Association would vote out of its funds one thousand pounds annually towards the fund for the yearly meeting, it would enable many towns to receive them, which at present are unable to do so. This would be a graceful act, and they might just as well do so, for they cannot spend their income, and they cannot dispose of it in grants for scientific research. A thousand pounds a year to aid original research and investigation in Great Britain. The very idea is demoralising; it cannot be entertained for a moment; and as there is no likelihood of this incorporated Association paying dividends, and each member getting a percentage

on his yearly subscription, it seems difficult to see what the Association can do with its surplus income unless it entertains itself therewith.

In several respects, then, the Bath Meeting of the British Medical Association has been remarkable, and probably future meetings will be influenced pronouncedly by this meeting at "the serious watering-place."

THE DUTY OF MEDICAL OFFICERS IN RELATION TO VACCINATION PROSECUTIONS IN IRELAND.

In the presence of a very serious epidemic of small-pox, which for nine months has marched uncontrolled through Ireland, it is necessary that we should call attention to a circumstance which, more than any other, tends to render nugatory the efforts of sanitarians to enforce vaccination in that division of the Kingdom. It is hardly necessary for us to remind the profession that, in consequence of the small fee (1s.), which Irish vaccinators receive for the operation (in comparison to that (2s. 6d.) which is paid to similar officers for similar services in England), vaccination is by no means as universal in Ireland as in its sister country, while it is more needed as a protective against small-pox, in consequence of the habits of the peasantry. Thus, a considerable section of the population of Ireland neglects vaccination, and it is essential that the system by which they are to be compelled to fulfil the law, should be administered with energy and regularity. It is the duty of the medical officer, in order that defaulters may be brought to book without loss of time, to report to his Board of Guardians the names and addresses of such defaulters within his district, and it is the duty of the Board to institute prosecutions. But these prosecutions must, and do fail, unless the medical officer is present in Court with his books to prove the default, and the service of his proper notice, and he is, therefore, always called upon to attend on such occasions. It is provided by the 13th section of the Vaccination Amendment Act, that "the Guardians may direct proceedings to be instituted for the purpose of enforcing obedience to the provisions of this Act; and as to all expenses incurred in such proceedings, if the Justices before whom such proceedings are had, certify that such expenses ought to be allowed, such Justices shall ascertain the amount thereof, and such amount shall be payable out of the Poor-rates;" and under this section the Justices are empowered to certify for a special fee to the medical officer for his attendance, and upon such certificate, the Guardians must pay. But the Justices are, at present, very generally ignorant of the law in this respect, and being often, both Guardians and ratepayers, are anxious to spare the rates any outlay. Moreover, the Local Government Board for Ireland has, most unwisely, endeavoured to discourage the payment of this special fee to the medical officer, and has stated more than once to Boards of Guardians that, in their opinion, the vaccinator ought to attend prosecutions *gratis*, and it therefore happens that the refusal by the magistrate of a fee has become quite frequent. We report a case to-day in which the medical officer had to travel sixteen miles a day on two separate days, and was, after all, refused his fee; and we have before us a similar case which recently occurred at Ballinasloe, and each week our provincial Irish exchanges supply us with several instances in which the medical officer has been thus mulcted of his time and labour. We assert that the attendance at such prosecutions is no part of his duty. That duty is set down by the Act of Parliament in the following words (Vac. Ireland Act, Sec. 1):—"And the said Medical Officer shall and he is hereby required *to vaccinate* all persons resident in his district who may come to him for that purpose, or whom he may be requested to vaccinate, being fit subjects for vaccination, subject to such regulations as may be issued by the Commissioners in that behalf." It is also expressed in the Dispensary Regulations in the following phrase:—"He shall vaccinate all persons who may come to him for that purpose at the dispensary, and shall do and perform all such other acts and things as may be *necessary for the purpose of causing such vaccination to be successfully terminated.*" In neither of these clauses is the prosecution of defaulters included as a duty of the medical officer and the Vaccination Amendment Act specially recognises that function as being altogether separate from the official duty.

It is not, however, with the object of pointing out the injustice and illegality of forcing such labour upon the medical officer without remuneration that we refer to the subject to-day, but in order to point out the result to which that policy must inevitably lead, and has led. It is to a certain extent at the discretion of the medical officer whether he will or will not report to the Guardians the defaulters of whom he may have knowledge. It is certainly his duty to do so, but it is a duty which is readily neglected, and it is difficult to detect that neglect on the part of the medical officer or to make him responsible for it. If there be no inducement to him to be energetic in hunting up defaulters or encouraging prosecutions, such culprits will certainly in the great majority of instances escape notice and will go on in life without vaccination, a danger to themselves and to the community. *A fortiori* if the medical officer be given to understand that his zeal in enforcing the law will bring upon him much unpopularity, considerable labour, long journeys, squabbles with his Board, and that he will get nothing for it, it is quite certain that all officers who are made of the ordinary human stuff will set their faces against prosecutions and will remember to forget who is in default. We are convinced that the unsatisfactory state of the present law on the subject—aggravated as it is by the discouragement to zeal which is the policy of the Irish L. G. B.—will lead and has led to evil results, and that, if the system be pursued for a few years, we shall have the satisfaction of knowing, on the occurrence of the next small-pox epidemic that a considerable population of unvaccinated persons is at large whom no law can ever reach. We trust that the L. G. B. will not incur the peril of such a misfortune, but will make it officially understood that the medical officer should be encouraged in every way to enforce the law against the defaulter and should be paid reasonably, nay, even liberally, for so indispensable a duty.

KEW GARDENS.

It is to be regretted that some of our great national institutions are national more in name than in reality, and that they are not sufficiently open to the public, for whose benefit they were in a great measure founded. This injudicious conservatism may be partly due to the majority of the community being indifferent to the matter, and to the small minority, interested in the pursuit of Science, or in the study of Nature, not being strong enough to secure those privileges to which they may justly lay claim. But it is also due to the selfish and monopolising spirit of those local authorities to whom the Government has given much power, and whose opinions carry great weight in any deliberations the Government may enter upon with respect to the management and uses of the institutions over which those authorities have so much control.

Kew Gardens have long held a high position among those public places that are devoted to the pleasure or instruction of the public. In a sanitary point of view alone, they are, as a place of recreation and amusement, a great boon to everyone within reach of them. They were formed at an enormous cost, and are supported with a revenue of over £22,000 a year; while, as a large field for the study of horticulture, botany, and vegetable physiology, they are second to none in the world. And yet those magnificent and useful gardens are closed to the public throughout the best part of the day, and for seven or eight hours after the time all other botanic gardens are open to the public. As a writer in the *Pall Mall Gazette* justly remarks, they are not open till one, which is generally the luncheon or dinner hour of most English people, and which, during the short winter days, virtually amounts to the closing of the gardens altogether. In the early morning of summer, in the early hours of a spring or autumnal day—periods equally favourable for study or recreation—these gardens are absolutely closed. Such an arrangement must appear to most people both unaccountable and indefensible, and certainly the arguments adduced in support of that arrangement are so flippant and sophistical, that it is surprising that the present management of the gardens has not been challenged more often than it has been.

First, we are told that the earlier opening of the gardens would interfere with the pursuit of science. This would be, if true, a serious allegation, considering that one of the chief purposes of the gardens is to develope and encourage a taste for botany and the sciences allied it. But the fact is, neither would the free opening of the gardens interfere with the pursuit of science, nor is there, unfortunately, much science going on to be interfered with. If the opponents of any change in the present arrangements mean such scientific work as is done in books or reports, it is done in the officers' rooms, in the library, or in the herbarium, with none of which the public wish to interfere; and with regard to such horticultural work as sending plants to the colonies, that is done in the propagating houses or packing sheds, which are always private. Even were the gardens more used, as they ought to be used for educational purposes, and the botanical classes held which are supposed to be held, the free and unrestricted admission of the public could not in the least interfere with either public teaching or private study. The gardens are large enough, as everyone knows, and there are plenty of places in them where lectures could be given, where the student could study, and scientific researches be conducted, without any hindrance from public interruption. It has even been alleged that the public would interfere with the gardeners doing their proper work! When the authorities have to resort to such an absurd argument as this, they only show the weakness of their case. It is also urged that the people have more time allowed them in Kew Gardens, than at any other gardens in the world; and that the general public do not desire to be admitted earlier than the present time. Neither of those allegations can be substantiated. The gardens at Edinburgh, Dublin, Paris, and Lyons, are all open early in the morning, and for a longer time than those at Kew are, notwithstanding the former are much nearer the cities to which they belong, than Kew is to London, and therefore, more likely to be crowded. Besides, even were the above statement correct, it does not follow that, because other countries adopt a faulty plan, we should do the same. Nor are they correct in saying that the public are indifferent on the subject. There are few of us who do not hear people constantly complaining that gardens, so far away from London, are not open till one o'clock, when the best part of the day for either recreation or instruction has gone, and the hot summer afternoons, or the short hours of a spring or autumnal day are alone left to them. As the writer above quoted remarks, throughout the whole of the winter and spring, the most agreeable time to visit Kew would be the bright morning and noon; and when the visitor lives at a distance, or when only one visit can be paid, there is literally not time, even in summer days, to see the place properly. With regard to another argument that has been urged, viz., that the proposed change would entail extra police and expenditure, it may be doubted whether much more expense would be incurred, provided the large funds at present at the disposal of the managers were economically administered.

But while the considerations that have been advanced in support of the present arrangement at Kew Gardens are such as cannot be for a moment entertained, the arguments in favour of the unrestricted opening of these gardens are, as might be gathered from the foregoing remarks, such as no unprejudiced person will attempt to disprove. It is evident that if the gardens, for the maintenance of which the public have to pay annually a large sum of money, were open in the forenoon, the advantages which the public derive from them, both from a sanitary and an educational point of view, would be far greater than they are now. On account of the short time now allowed either for study or recreation, the gardens are, except during public holidays, almost deserted. But were a different arrangement adopted, hundreds would take the place of the few visitors that are now to be daily seen there. With regard to the health and recreation of the people, these gardens may be reckoned among the "lungs" of London; but of very little use will they be in this respect, if the public are to be shut out of them during the most enjoyable part of the day, and if distant visitors are to be virtually excluded from them through the limited time during which they are open.

It is, however, from a moral and educational standpoint,

that we would insist upon every facility being given for visiting these gardens, and every encouragement being held out to students to take advantage of the fine opportunity offered them for the study of botany and horticulture. What Mr. Ruskin has so well said of "art-intellect," may be also said of science intellect. "A certain quantity of art-intellect," says that eloquent writer, "is born annually in every nation. . . . . You may lose it, or you may gather it; you may let it lie loose in the ravine and buried in the sands, or you may make kings' thrones of it, and overlay temple gates with it, as you choose." In the same manner we may say that a certain quantity of science-intellect, and nature-loving intellect, is born to us every year. We may lose much of this also, or we may gather it. We may let it lie buried in obscurity or blighted by indifference and neglect. Or we may let it expand the intellect, improve the taste, and even mould the character of thousands. We may make out of it discoveries that never would have been made, and diffuse widely a taste for the beautiful that never would have been diffused, but for the fostering influence of popular education, and the help and encouragement of all who are interested in the moral and intellectual advancement of the community. By all means, therefore, let these gardens be opened the greater part of the day, and let classes be held and lectures delivered, and every other means taken to attract the visitor, whether in search of health or of knowledge. Then, out of the thousands that will be annually flocking to them, there will be less chance of science-intellect and nature-loving intellect running to waste, and more chance of adding largely to the many eminent botanists we have amongst us. Then, perhaps, more Lindleys and more Linnæuses will spring up, who, but for the opportunities and incentives which we wish to see extended, might have been doomed to spend their lives in ignorance and obscurity.

COULD WE BUT KEEP FROM THINKING!

Could we but keep from thinking; or rather could we but keep our patients from thinking, how much better it would be for their health and our reputation. We are "called in," we give an opinion with regard to the nature of the disease, we write a prescription, give a few common place directions, and then think we have done our duty. And the patient! when he has taken his physic, does he not also suppose that he has done his duty? Both physician and patient too often forget the harm that is done by thinking—by unprofitable thinking, by unavailing regret, and by that mental recitation of the past, and brooding over present evils, to which we are all apt to give way. Thinking retards recovery, makes pain more painful, sends many to a lunatic asylum. It robs the invalid of his sleep, it palls his appetite, depresses his spirits, lowers his pulse, takes from him all spirit and energy, and makes him insensible to pleasures still within his reach.

The influence which fixed attention, or the mere centring of our consciousness on a certain organ, has upon the functions of that organ, is well known to physiologists. And if in a healthy person the heart can be made to palpitate, the cheek to blush, and the pulse to beat more quickly, by concentration of the attention, how much greater will be the influence of this condition of the mind over those organs or functions that are weakened by disease. Like all other animals, we live mostly in the present. It is only the madman or the enthusiast who lives mostly in the past or in the future. But, unlike other animals, we often live too much in the past and in the future, and that too, when neither the former gives us pleasure, nor the latter hope.

It should often be the duty of the physician to regulate as far as he can the thoughts, as well as the diet and the physical treatment of his patient. It should also be the duty of the patient to second the endeavours of his physician; for as the Father of Medicine has told us in one of his celebrated aphorisms:—The art consists in three things, the disease, the patient, and the physician. The physician is the servant of Nature, and the patient must combat the disease along with the physician. Unfortunately, we are apt sometimes to think too much of his disease and too little of the patient, as though his disease was a separate entity, apart from the rest of his body, apart from his mind, and over which his thoughts exercised no influence or control. The invalid will say:—"How can I help thinking, especially when the past brings so little ease, and the future so little hope?" But he can help it. It is not that he cannot turn the current of his thoughts; it is that he makes no effort to do so. There is the power, but neither the inclination nor the will. There are few things in Locke's writings more admirable and more useful than his remarks on "Transferring of Thoughts," and as they are particularly applicable to our present speculation, a short quotation will not be unwelcome to the reader. "There is," says the great philosopher, "scarce anything more for the improvement of knowledge, for the ease of life, and the despatch of business, than for a man to be able to dispose of his own thoughts; and there is scarce anything harder in the whole contest of the understanding than to get a full mastery, over them, especially if we have let the contrary grow to a habit. But constant endeavours will by degrees prevail, and at last make it easy . . . . so that at last a man may have full power over his own mind, and be so fully master of his own thoughts, as to be able to transfer them from one subject to another with the same ease that he can lay by anything in his hand, and take something else that he has a mind to be in the room of it.' Now it is just this "transference of thoughts," that might be turned to some good account, both in the treatment and prevention of disease; and as the ability to transfer our thoughts from one object or event to another is in proportion to the effort we make, it is the duty of us all to make that effort when we are affected in body or in mind, or whenever we are tempted to brood over any misfortune the continual contemplation of which may sow the seeds of some serious or even incurable disorder. It is equally the duty of the physician to always bear in mind the influence of the mind over the body and its ailments, and to encourage by all means in his power that frame of mind in his patients, and that regulation and "transference" of their thoughts, which will be most conducive to their recovery.

On this subject, which has received too little attention from medical writers, we might say much more, did time and opportunity permit. We shall therefore draw this

article to a conclusion by citing a simple anecdote which may perhaps bring home more forcibly to the reader the truth of the above remarks.

It is narrated by an American physician, Dr. Frank H. Hamilton, of New York, who thoroughly appreciates the "value of forgetfulness as a means of curing purely physical maladies." A little child was suddenly, and under very painful circumstances, separated from her mother. She went to bed and laid all night with her eyes wide open and directed to the wall, shedding no tears, making no noise, and refusing obstinately to take either food, drink, or medicine. After some time had elapsed without any improvement in the condition of the child, it occurred to her physician that probably she was thinking, and needed diversion. At the suggestion of his wife, to whom the incident had been related, a doll with blonde hair was dressed with great taste, with plenty of blue, red, and yellow ribbons, arranged in most attractive contrasts. Provided with this new medicine, which by the way is not mentioned in our works on materia medica, her physician visited the hospital early on the following morning. Her condition had not changed. For more than thirty-six hours she had lain in the same position, refusing to take, to do, or to attend to anything, and gazing steadily at the dead wall. The gaily dressed doll was held before her, and very shortly a little skeleton hand came out slowly from under the cover, and the doll with its ribbons was drawn into the bed. From this day her recovery was rapid and complete. Such is the simple, and, as some may say, oft-told tale. Nevertheless, it is not without its moral, for are we not all of us children, and have we not all of us some doll with which we are or may be amused?

Notes on Current Topics.

Liverpool and the Contagious Diseases Acts.

Mr. Frederick W. Lowndes, surgeon to the Liverpool Lock Hospital, has recently published a pamphlet in which he shows the advisability of extending these Acts to Liverpool and other seaports. According to his statement, venereal diseases have not diminished in frequency nor in severity in Liverpool, Bristol, Cardiff, Dublin, Hull, and, with some modifications, Glasgow; whilst in other seaports, where the Acts are in operation, these diseases have considerabiy diminished in frequency, while their type has assumed a much milder form. It may also be shown that the moral and social improvement of the latter has been at least on a par with their physical improvement. He could not imagine, he says, anything more beneficial than would be the extension of these Acts, if not generally, at least to those places where the evils which they have so much mitigated elsewhere are still rampant. With regard to Liverpool, even the preliminary step of appointing a special police to ascertain the number, abode, &c., of the common prostitutes of that town, would be attended with marvellous results. "Many a den of abomination which has been permitted to exist year after year, would, from the daylight thus introduced, be swept away. Many a street that is now entirely composed of the abodes of filthy and diseased prostitutes would, after a few visits of the special police, assume a totally different appearance to what it now presents."

There can be no doubt that the same reasons which have been urged in favour of these Acts with regard to the places where they are now in operation, hold good with regard to their extension to those seaports where venereal diseases are so extensively prevalent. If, as we all know to be true, they have done so much good in one case, there is no reason why they should not be as beneficial in the other. Our merchant seamen have scarcely less right to be protected from the disease than the army and navy have. We quite expect the time will come when the Acts will be extended among all large populations. No one who watches the signs of the times can fail to notice that the prevention of disease is now receiving an amount of attention which it has never before received; and in all probability this great hygienic movement will, ere long, lead to the general extension of these Acts. Medical men need not be told why it is of the greatest importance to the community that a check should be put upon the propagation of venereal diseases; and when the public themselves begin to realise the necessity of some legislative control over public prostitution and the evils to which it gives rise, the extension of these Acts will not meet with so much opposition as is now offered to them. Mr. Lowndes concludes his pamphlet with a very apt quotation from the well-known work of Parent Duchatelet on "The Prostitution in Paris," which it would be as well for the opponents of the Contagious Diseases Act to read and digest. "If legislation cannot render men virtuous; if it cannot correct the judgment and repress the impetuosity of passions which appeal to their senses too loudly to leave them the consciousness of duty; at least, it may meet the danger to which the imprudent expose themselves and, for the sake of these men's wives and children, look after the health of the guilty in order to preserve the innocent. I will go further, for I maintain that it ought to do so, and that those who have neglected this important duty have been unfaithful to their trust, and can only be excused by their ignorance of the benefits of the sanitary surveillance of prostitution."

The Typhoid Epidemic at Bristol.

It appears that the outbreak of typhoid fever in the suburbs of Bristol has increased to an alarming extent. The medical officer of health for Bristol has reported that all the cases had been traced to one milk supply at a farm on which was a well of water contaminated with sewage and typhoid germs, a patient convalescent from that disease having been staying at the farm. He also learnt that other convalescent patients had also been accommodated at farms which largely supplied milk to Bristol, and this fact, he thought, pointed to the desirability of placing the milk supply of a large city under some efficient supervision.

Should the above statement prove to be perfectly correct, it will go far to corroborate the opinions entertained by some pathologists respecting the specific origin of typhoid fever, and to throw doubt upon the pythogenic theory of that disease. We quite agree with the medical officer of

health in thinking that the milk farms supplying large cities with milk should be placed under some kind of supervision. This might be easily done through the existing sanitary authorities, who should have the power to make periodical inspection of these farms, to see that there were no means by which their milk could become contaminated with sewage matter. Moreover, the above facts show one way in which convalescents may spread disease in places far removed from those in which their illness was originally contracted. But not the only way; for there can be no doubt that convalescents removing prematurely to the seaside and other health resorts often, through their clothes and other agents, jeopardise the health of those who come within reach of the contagion.

Accidental Poisoning with Carbolic Acid.

It is time that chemists and everyone else in the habit of using this disinfectant should be careful that it is not dispensed or left about in such a manner as to run the risk of being taken for some other substance. A few days ago a boy, aged 13, died through drinking some of this acid out of a bottle which had been carelessly left in a shed without the cork being tied down, and without any label upon it. The deceased, with another boy, supposed that the bottle contained beer, and accordingly drank some of its contents.

It is to be regretted that a valuable new remedy cannot be employed long, before the abuse of it, or the careless sale or dispensing of it, entails some serious and often fatal accident among the community. It is not long since both chloral and carbolic acid were first brought to the notice of the profession, and already there have been many cases of poisoning by these drugs. In the case above mentioned one of the jurymen was for bringing in a verdict of manslaughter against the local sanitary authority, to whom the bottle belonged. Such a verdict would have been scarcely justifiable, but perhaps few accidents of the kind would occur if the chemist or the owner of the poison, as the case might be, were subject to a heavy fine in the event of a fatal accident arising through their negligence. Besides, the frequent occurrence of these accidents prejudices the mind of the public against drugs which, if used in a proper manner, are very valuable agents, either in the prevention or treatment of disease. It has, for instance, been suggested that carbolic acid should not be used at all as a disinfectant, but few who are acquainted with the composition and properties of this agent will admit the propriety of the suggestion.

The Oldest Inhabitant.

The Registrar of the sub-district of Spitalfields has just registered the death of an old resident in that neighbourhood who completed his 103rd birthday in last January. He dwelt for nearly seventy years in the same house, where he was never known to be confined to his room by a single day's illness.

Whether this case would bear the investigation of those sceptics who, like the late Sir George Cornewall Lewis, would scarcely believe there was a well-authenticated centenarian, we will not venture to say. But we know, partly on physiological grounds, and partly from a few instances in which the alleged age has never been disputed, that there is no insurmountable obstacle to centenarians becoming much more numerous than they are at present. At all events, the occasional reports of men who have attained to a very advanced age, should suggest to everyone the propriety of so managing their bodily estate as to make it as great, as lasting, and as profitable as circumstances will allow. That we can only do by systematically adopting those hygienic practices which are inculcated by a knowledge of the laws of health—a knowledge which it is to be hoped will daily become more and more a part of our general education.

The Medical Bill.

As we anticipated in our last issue, the opposition of the Scotch Licensing Bodies and the Queen's University, and the difficulty of satisfying the views of the ladies, have proved too much for the Bill, and it is withdrawn. We greatly regret that the Government did not avoid the necessity for adopting this course, which they might have done if they had faced the opposition and overcome it by a vote of the House of Commons. The Bill had the whole profession and most of the public as its supporters, for we do not count as worthy of consideration the opposition of those who are interested in maintaining abuses, or of the small minority who do not know what they want except to show their own importance, and assert what they conceive to be their grievances. We may, however, satisfy ourselves with the assurances that if the Duke of Richmond and Lord George Hamilton hold their present offices next session, and if the country has nothing to occupy it except domestic legislation, the Bill will certainly pass in the early part of 1879. Ministers are, apparently, quite determined in reforming the profession, and there is really no opposition which need deter them, nor would it alter the case if they were indifferent, for the feeling of the country upon the subject has been aroused, and we should certainly have one or two private Bills, which would oblige the Government to take action upon the matter. Nevertheless, in the interest of all parties concerned, we regret that the Bill did not pass, for we consider that a moderate measure of reform which it proposes will be less dangerous to the profession, and more advantageous to the community, than a measure of violent revolution, which we may yet have to discuss.

Upon the Treatment of Strumous Disease by what may be called the Solfatara Method.

To the north of Naples, and in the rear of Pozzuoli (or Puteoli of the New Testament), is the crater of an extinct volcano called the Solfatara. The crater is easily accessible by carriage or by foot passengers, and presents the appearance of a mammoth circus ring of somewhat uneven surface, and having at different points—chiefly where the floor joins the circumferential wall—a number of fissures or volcanic vent-holes called *stufe*. From these holes is emitted steam and vapour in varying quantities, charged with fumes of sulphur and arsenic.

Dr. Horatio R. Storer, of Newport, sends to the Boston *Medical and Surgical Journal* an account of the benefits which have been derived from the inhalation by strumous

and consumptive persons of the fumes, and among the number he includes the case of his son.

The first attempt of which he has knowledge when these fumes were utilised for medical purposes was by Dr. Abele Franza, in 1871. A Russian affected with advanced tubercular disease was removed from Naples to Pozzuoli, and during six weeks was carried from time to time to the Solfatara, in order that he might inhale the vapours. Improvement was declared to have been immediate and permanent.

A second case of acute tuberculosis was similarly relieved without resort to other measures. Prof. de Luca has made numerous observations on the composition of the thermal mineral waters of the Solfatara and on the temperature and exhalation of the greater throat (*fumarola*) of the crater; and his papers on the subject are referred to by Dr. Storer. Young Storer is said to have commenced to improve almost immediately after resorting to the crater, but he also drank of the waters found in the crater, containing sulphuric acid.

The beneficial effect of the treatment is presumed to depend upon the arsenic contained in the vapour.

The Normal Inequality of Lower Limbs.

From the Proceeedings of the King's county Medical Society, U.S., it appears that the first trial for malpraxis, that ever hinged on this fact in nature, transpired recently in America. Suit had been brought because of a shortened femur, after treatment, of five-eighths of an inch. The defendant's witnesses testified that a want of symmetry in legs frequently existed where there had been neither fracture nor injury. The cause was non-suited without delay, and "the imperilled surgeon went free." Drs. Agnew and Hunt, of Philadelphia, testified that they had measured many limbs and had found them unequal, without previous fracture; the brother of the plaintiff, whom they chanced to measure, had a normal difference of three-eighths of an inch. This trial is destined to become widely known, and to materially influence the history of this class of suits for malpractice.

The Egyptian Medical School.

The Egyptian Medical School at Kars-el-Aïn was founded in 1827, by Mehemet Ali, closed by Abbas Pasha in 1849, and reopened by Saïd in 1856. It has since then, under the teaching of Professors Clot Bey, Reyer, Lautner, Bilharz, Griesinger, and others, restored Egyptian medicine to the rank of a science, and replaced the Frankish quacks of the last generation by a native faculty which, probably, has no equal in the East. The Mohammedan prejudice against dissection has here long been overcome, and the latest results of Western pathology having obtained free adoption, this College turns out physicians, surgeons, and apothecaries, many of whom would be a credit to the best European schools. Its curriculum extends over five years, the first two of which are appropriated to further pursuit of the general education previously begun in the lower schools, and the remaining three to exclusively medical studies. A large and well-organised hospital in connection with this school furnishes ample means of clinical instruction to the students, and gratuitous medical treatment to all comers. Attached to it, also, is the School of Midwifery, in which thirty young native women are taught reading, &c., and the elements of medical science and obstetrics; passing through a three-years' course of instruction, they are certified, and sent into the provinces where the common prejudice of Arabs and Copts forbids male practitioners of the obstetric art.

Vaseline as a Base for Eye-Salves.

In a recent clinical lecture, Dr. Galezowski speaks of the great advance in the treatment of scrofulous affections of the eye, chiefly keratitis and conjunctivitis, by the use of the yellow oxide of mercury. The preparation is almost a specific in phlyctenular keratitis and phlyctenular kerato-conjunctivitis.

In order that the salve shall be the most efficacious, it must be as little irritating as possible. Vaseline he regards as the most suitable preparation as a vehicle. It is free from acids, and is unalterable,—properties not possessed by any of the fats. He says his trials with the vaseline have far surpassed his expectations, and ends with giving two formulæ that he uses, the one of the yellow oxide of mercury, and vaseline for scrofulous phlyctenular keratitis, the other of nitrate of silver, and vaseline for granular conjunctivitis.

Hospital Saturday Fund.

The fifth meeting of the Board of Delegates for the present year, was held in the Board Room of the West London Hospital, kindly lent for the occasion. In the absence of Mr. Samuel Morley, the President of the Fund, Mr. John Hughes, Q.C., the chairman of the Council, presided. There was a good attendance of members, and the Secretary, Mr. Parr, gave a full report of the progress of the work, which the Delegates seemed to think, portended a successful collection. Mr. A. W. Mackenzie (Honorary Secretary), then brought up the plan of distribution as approved by the Council. In moving its adoption, he explained that the Distribution Committee in order to make the plan as perfect as possible, had put themselves in communication with some of the leading medical men of London, who had been good enough to give some valuable advice, they had also examined the plans in use by the Saturday or Sunday Funds of Dublin, Liverpool, Manchester, Portsmouth, Leeds, Nottingham, and Birmingham, and he thought the scheme as now submitted would be found to work well. After some discussion, the plan as proposed was adopted. It was stated that the Council had extended the time for the receipt of applications from Hospitals and Dispensaries, to participate in this year's collection to the 13th of August. Hospital Saturday itself has been fixed for the 7th of September.

An application has been made to the Master of the Rolls to restrain Mrs. Annie Besant, whose writings we have frequently commented upon, from molesting or annoying her husband, the Rev. Frank Besant, by letter or otherwise, and also from instituting any claim, action, or other proceeding for the purpose of compelling him to live with her. The Master of the Rolls granted the restraining order until the first day on which the vacation judge shall sit, with liberty to serve notice of motion for that day.

The Toilet Habits of Ants.

The Rev. H. C. McCook, of Philadelphia, eulogises the neatness of the agricultural ant, as observed in confinement at any rate. The most minute particles of dirt are carefully removed, and the whole body is frequently and thoroughly cleansed, especially after eating and sleeping. They assist each other in the general cleansing, and the attitude of the ant under operation is one of intense satisfaction, like that of a family dog being scratched, a perfect picture of muscular surrender and ease. Mr. McCook has seen an ant kneel down before another, and thrust forward the head under the face of the other, and lie motionless, expressing quite plainly the desire to be cleansed; the other ant understood this, and went to work. Sometimes this is combined with acrobatic feats, in which these ants excel, jumping about and clinging to blades of grass in a remarkable fashion. Sometimes the cleansing ant hangs downwards from the grass, and to her the ant operated upon clings, reaching over and up with great agility to submit to her friend's offices. Evidently moisture from the mouth is used for washing. Mr. McCook has observed most minutely the whole of these processes, which are recorded in the Philadelphia Academy's "Proceedings" for this year. He suggests that with ants as with the human kind an artificial condition induces greater attention to personal appearance.

Sanitation of Jarrow-on-Tyne.

Dr. Spear, the medical officer of health for Jarrow-on-Tyne, in his last report to the council, makes a lamentable revelation as to the state of the drainage of that borough. A man occupying a house in Duke Street, lost his wife and three children in ten months; it was a two-roomed dwelling, and on taking up the boards the foundations were found covered by a slimy liquid, the stench from which was unbearable, and on the surface of which gases from decomposed matter kept bubbling up. A house-to-house visitation showed that the whole of the dwellings in the street were more or less infected from the same cause.

Parasitic Diarrhœa in China.

In Cochin China (our readers are doubtless aware), the French troups have suffered greatly from a form of diarrhœa, which is now known to be caused by entrance of small animalculæ into the alimentary canal; these have organs of suction or prehension, and fix on the mucous surface (somewhat like lecches), causing an irritation which is manifested as dysentery. An interesting paper on the subject and dysentery in general by Dr. Dounon, appears in the *Moniteur Scientifique* for July. There are seven varieties of the Cochin China diarrhœa, and it certainly arises from the rivers and marshes, the active principle being conveyed into the body in drinking the water. The Chinese and Annamites are free of it, because they drink either tea or water purified with alum. Dr. Dounon recommends, as a remedy, the more simple method of boiling the water, as this at once destroys the germs and animals. He thinks it very probable that various other forms of dysentery in other countries are of parasitic origin, and to be prevented by the same means.

The office of Professor-Superintendent of the Brown Animal Sanatory Institution (under the Government of the University of London) being about to become vacant by the resignation of Dr. Burdon Sanderson, applications are invited from candidates for the appointment. The objects of this institution are—(1) The investigating, studying, and endeavouring to cure, maladies, distempers, and injuries, any quadrupeds or birds useful to man may be found subject to; (2) the promotion of the science of comparative pathology by the examination of bodies of dead animals; (3) the diffusion of the knowledge so acquired by the delivery of at least five lectures annually. The salary attached to the office is £300 per annum, and the trustees provide a residence, a laboratory, and an able veterinary assistant.

At the Graduation Ceremonial in Medicine and Law in connection with the University of Edinburgh held on August 7 the honorary degree of LL.D. was conferred on James Risdon Bennett, M.D. Edinburgh, F.R.S., President of the Royal College of Physicians, London, Sir Joseph Fayrer, M.D. Edinburgh, K.C.S.I., F.R.S., John Richard Green, M.A. Oxon, Joseph Lister, M.B. London, F.R.S., lately Professor of Clinical Surgery in the University of Edinburgh, and now of King's College, London.

Mr Charles Darwin has been elected Corresponding Member of the Paris Academy of Sciences in the section of Zoology by 26 votes against 14. This success is all the more notable that Mr. Darwin obtained only 5 votes in a scrutiny which took place quite recently. Prof. Asa Gray has been elected a corresponding member in the Section of Botany in succession to the late Dr. Braun, of Berlin.

As several lunatics from the Bodmin county asylum were being taken for exercise near the sea coast of North Cornwall, two of them escaped from their keepers and ran up the rocks. Stripping their clothes off they sprang into the sea. Being excellent swimmers, they were in no danger until their return, when waves dashed them violently on the shore. They struggled long, and one succeeded in landing, but the other at length succumbed, after having nearly drowned his companion by catching his leg.

A lady who desires no notoriety has given $20,000 to the Commissioners of Charities, in New York city, for the purpose of erecting a surgical pavilion on the grounds of Bellevue Hospital, where respectable patients may receive care separate from those who cannot be regarded as respectable. The building will contain rooms for thirty patients.

Intelligence from Senegal announces that yellow fever has broken out there. Six doctors and apothecaries will leave for Gorea by the first mail steamer, and measures have been taken to prevent the epidemic from spreading.

ROYAL MEDICAL BENEVOLENT FUND SOCIETY FOR IRELAND.

THE committee of the Belfast branch of this society held a quarterly meeting on Aug. 7 in the chambers, 33 High Street, at twelve o'clock. Present—Dr. Purdon, Dr. Arnold, Dr. Ferguson, Dr. Drennan, Dr. M'Cleery, Dr. Higginson, Bangor; and Dr. M'Gee.

On the motion of Dr. M'Gee, seconded by Dr. Ferguson,

Dr. T. A. Purdon was called to the chair.

The Hon. Secretary (Dr. Arnold) read the minutes of the last meeting, which were confirmed. He intimated that he had seen their friend, Dr. Browne, hon. treasurer, who regretted his inability to be present at their meeting. Had Dr. Browne been with them he would have reported that the grants recommended to be paid to the annuitants of this branch had been duly awarded at the annual meeting of the parent society, and had been distributed by their hon. treasurer; and that the recipients of their bounty had expressed themselves as grateful for the timely aid thus afforded. The hon. treasurer would have further intimated that, although the great mass of their subscribers had with promptitude and generosity responded to the call of their hon. collectors, yet a few subscriptions remained unpaid; and he would have expressed the hope, in which he (Dr. Arnold) was sure the meeting would join, that the brethren who might not yet have paid their subscriptions would kindly remit the same to Dr. Browne, hon. treasurer, 19 College Square East, without delay. (Applause.)

Dr. Ferguson believed that their brethren had overlooked the matter.

Dr. M'Cleery thought a circular should be sent to each of them.

Dr. Drennan—On reading the report of this meeting it will recall the omission to memory. Many men think they have paid when they have not.

Dr. Higginson (Bangor) reported as to his district in the County Down.

The annual report was then laid upon the table. It was stated that a copy of it would shortly be in the hands of all the members.

Dr. Ferguson was called to the second chair, and, a vote of thanks having been accorded to the chairman,

The meeting concluded.

BRITISH PHARMACEUTICAL CONFERENCE.

THE fifteenth annual meeting of the Conference is now in session in Dublin. The sitting commenced yesterday the 13th. The Irish Committee have pleasure in announcing, as far as possible, the completion of their arrangements—viz.: The Conference meetings are held at the Great Hall of the College of Physicians, Kildare Street, members of the medical profession being invited to be present. The following papers will be read:—

1. Report on the Aconite Alkaloids, C. R. Alder-Wright, D.Sc. Lond., and A. P. Luff. 2. Report on Brucia and the Constituents of Strychnos Bark, W. A. Shenstone, F.I.C. 3. Bismuth Residues, Dr. Letts, F.I.C. 4. Soluble Essence of Ginger, J. G. Thresh, F.C.S. 5. Note on Reichert's Improved Thermo-Regulator, C. Symes, Ph.D. 6. Nitrite of Amyl, Mr. D. B. Dott. 7. Note on Beberia, Mr. D. B. Dott. 8. Notes on the Titration of Hydrocyanic Acid and Cyanides, and its Relation to Alkalimetry, L. Siebold, F.I.C., F.C.S. 9. The Presence or Absence of Sugar as a Normal Constituent in Urine, L. Siebold, F.I.C., F.C.S. 10. The Microscope in Materia Medica, T. Greenish, F.C.S. 11. Miscible Copaiba, L. B. Groves, F.C.S. 12. Baycuru, C. Symes, Ph.D. 13. Note on an Improved Preparation of Ergot, A. W. Postans. F.C.S. 14. Chloroform, A. H. Mason, F.C.S. 15. A Comparison of the Strength of some of the Cinchona Preparations, C. Ekin, F.C.S. 16. The Assay of Cinchona, Mr. J. B. Smith. 17. The Extraction of Emetia from the Deposit in *Vinum Ipecacuanhæ*, G. Brownen, F.C.S. 18. Adulteration of Drugs, C. R. C. Tichborne, LL.D., &c. 19. Authoritative Formulæ for Unofficial Preparations, F. Baden Benger, F.C.S. 20. Solution of Iodoform and Iodoformed Lint, G. A. Keyworth, F.C.S. 21. Notes on Opium, Mr. B. S. Procter. 22. Notes on the Methods of distinguishing Carbolic Acid, Cresylic Acid, and Creasote, A. H. Allen, F.I.C., F.C.S. 23. On a Reaction of Orange Flower Water, R. Reynolds, F.C.S., and Mr. C. H. Bothamley. 25. Preliminary Examination of Pituri or Pitchere, A. W. Gerrard, F.C.S. 26. Note on *Jacoranda procera*, A. W. Gerrard, F.C.S. 27. Note on the Preparation of Phosphorus Pills, A. W. Gerrard, F.C.S.

On to-morrow the 15th the Irish vice-presidents and committee, on behalf of the chemists of Ireland, have invited the visitors of the Conference to accompany them on an excursion to Glendalough or the Seven Churches. A special train has been engaged to start from Harcourt Street at 8.30 o'clock. Visitors and friends should be at the station at least five minutes before the time of starting. Arriving at Rathnew at 9.30 o'clock, cars and waggonnettes have been engaged to convey the party to the churches by Devil's Glen. All who desire it may walk through the Glen and meet the vehicles at the other end and drive on to Glendalough, where lunch will be provided immediately on arrival at one o'clock. Returning at 3.30 o'clock through Vale of Clara to Rathdrum, where the special train awaits them, starting for Dublin at 5.30 o'clock, which is reached about seven o'clock, when they will proceed to the Exhibition Palace, where at 7.30 o'clock dinner will be provided.

Correspondence.

FEES FOR VACCINATION PROSECUTIONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—On July the 4th I was summoned by the Board of Guardians of the union in which my dispensary is situated to give evidence in some vaccination prosecutions at the petty sessions (held eight miles from my house). As there was no magistrate in attendance the cases were postponed till the following month. I again attended at court and gave my evidence, after which I handed a printed application for my fees and expenses to the presiding magistrates to be signed. Two of them were for signing the paper, but the chairman, though considering my claim quite just, was opposed to signing it, on the ground that he would be censured severely by the other guardians at the next meeting of the board. He therefore asked me to allow him to refer the matter to the board at their next meeting, and he would do all in his power to get me my expenses. The meeting has been held, and this day I have received a letter from the clerk to the union, informing me that my "application being new to the guardians they did not allow it." Now what am I to do? Have I any legal redress? In addition to the loss of time I have had to pay 18s. for car hire. This I consider too hard, and am thinking of writing to the Local Board on the subject, but am not sure if it is the right course. It is no wonder that vaccination should be inefficiently performed in Ireland when public vaccinators are treated so. When I came to this district about four months ago I found children five years of age and upwards unvaccinated, and to put a stop to this abuse I reported some cases to the Board of Guardians with the above result. This my first effort to have the Vaccination Act properly carried out in my district has taught me a lesson not easily forgotten.

Yours obediently,

M. B.

[If our correspondent had a definite order from the guardians to attend and give evidence he can make them responsible, and may issue a process as soon as he pleases. In the case of Kisbey *v.* The Boyle Guardians (see Report of Irish Medical Association) it was ruled that an order from the guardians is a valid contract, even if the magistrates did not grant a certificate for the fee. If our correspondent had no definite order from the guardians, his only course is to apply again to the magistrates, pointing out to them their powers under the 13th section of the Vaccination Amendment Act ("Irish Medical Directory," p. 501). If they still refuse to certify, appeal should be made to the Local Government Board, and if necessary to the Council of the Irish

Medical Association. Under the New Public Health Act, which was in operation since August 1st, the guardians *must* pay whether they like it or not.—Ed. M. P. & C.]

PRACTICAL SCIENCE AT THE POLYTECHNIC.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Whilst thanking you for your kindly notice of the Polytechnic in your issue of July 31st., I shall be glad if you will permit me to say a word, lest your remarks may convey an erroneous impression respecting my duties at the Institution. I am not *Managing* Director, but simply one of the Board of Directors. The former office was undertaken by me some few years back, at a time when the Polytechnic was in such a position that it could not afford to pay a competent manager, and I performed the duties for about three years gratuitously. The labour, however, in addition to my professional work, was too heavy to allow me ever to undertake such an office again, but in answer to the unanimous wish of the shareholders in general meeting, I returned to the Board, where I hope to be of service to it and the public.

Whilst my pen is in hand, I should like to call your attention to an arrangement the Directors have made, likely to be of great practical value to students entering our profession. They have determined to separate the laboratory and classrooms from the rest of the building, with a view of establishing a high class school of science, to enable students to pursue *practical* work. After much deliberation, they have selected from many candidates as an occupant of the laboratory, Dr. E. B. Aveling, who will in future direct the studies of those who enter. This gentleman, who is a Doctor of Science of London University, Lecturer on Comparative Anatomy at the London Hospital, and on various branches of science at several well-known institutions is, I think, well fitted to fill the post; and I hope, therefore, that before long we shall see a large and flourishing school of practical science in our time-honoured institution, which is situated in a spot that for convenience of access is second to none in the metropolis.

Yours, &c.,

Robert Charles Crofts.

August 5, 1878.

OPENING OF THE NEW MUSEUM AND LIBRARY AT THE ROYAL COLLEGE OF SURGEONS IN IRELAND.

On Saturday last the new buildings were formally opened by his Grace the Duke of Marlborough, Lord Lieutenant. The new wing contains a large apartment on the ground floor for a library, and one of the same dimensions above it for a museum, the foundation stone of which was laid in 1876 by the Duke of Abercorn. The new wing extends parallel to York Street. The library is seventy feet long by thirty-six in width, and is built as an extension of the old library, which was twenty feet in length, a wall of which has been replaced by pillars, and a descent of two steps leads from the one chamber to the other. The books, including the collection known as the "Jacob" Library, occupy the shelves. The museum is extremely spacious and handsome, and has a handsomely designed wooden roof. There is a gallery at a height of about twelve feet from the ground. On each side below are projecting glass cases, the frames of which serve as supports to the gallery in lieu of pillars, while light is obtained laterally through the glazed sides of the case. The result of these arrangements is that ample light is secured for the contents of the glass cases and of the museum generally. There is a hot water apparatus for heating the room in winter. This museum is connected by a new corridor with the old museum and the board-room, and is devoted to the reception of between four and five thousand pathological specimens, and also of the valuable collection of wax anatomical models presented to the College in 1830 by the Duke of Northumberland, then Lord Lieutenant of Ireland. There are also rooms for the curator. The new buildings have cost nearly £10,000. The entire interior of the College has been repainted and decorated.

His Grace the Duke of Marlborough and the Duchess of Marlborough and suite were received by the President of the College of Surgeons, Philip C. Smyly, M.D., and members of the Council and of the Courts of Examiners, and by a large assemblage of the fellows and licentiates, and of ladies, and were conducted through the new building. Having inspected the whole of the College, their Graces descended to the library.

The President of the College of Surgeons, addressing the Lord Lieutenant, said he had, in the name of the Council, to thank him for his presence on that occasion. His Grace's predecessor had on more than one occasion honoured them by his presence there; but it had been reserved as a crowning honour to him to welcome her Grace within those walls. That College had now been in existence for nearly a hundred years. During that hundred years it had ever endeavoured to advance the study of the art and science of surgery. They had done so by strict and searching examinations, of which they were very proud, and by the opportunities which they had afforded to their students in the school attached to that institution, and in the affiliated schools in which the students were taught. Their library and museum were also means by which they taught those who aspired to admission to their profession. The library and museum had completely outgrown the space that they had available for their purpose, and therefore, they had had to enlarge those buildings in the way that his Grace had already seen, having inspected the new Museum and Library which he had so kindly come that day to open. The foundation stone of those buildings had been laid by the Duke of Abercorn, and his Grace the Lord Lieutenant—acting as he always did in respect of anything calculated to advance the interests of Ireland—had now come to open those buildings to the profession. During the hundred years that it had existed the College of Surgeons had accumulated funds which had been expended for the benefit of the medical profession, and for the advancement of surgery. The only source of income that they had ever enjoyed had been the fees paid for their diplomas. He desired to allude to the Medical Bill which had been lately before Parliament. That College had given the Government every assistance in their power to pass that Bill. They thought that in many points it was a most valuable Bill; and, as a member of the Council of the College, he begged, through his Grace, to thank the Government for the great courtesy with which they had received their deputation in London, and for the kindness with which the Lord President and Lord George Hamilton had assisted their recommendations.

His Grace the Lord Lieutenant said—Mr. President and Fellows and Licentiates of the Royal College of Surgeons of Ireland, I can assure you that it is with the greatest pleasure that I find myself present here to-day to fulfil the task which has been requested at my hands by your President of declaring this building open; and it needed not those eloquent words which have fallen from your President, in describing the past history of this institution, to make one aware of the great benefits which it has already conferred, and is still conferring, not only upon this country in which we are, but on the world at large. Great names—the names of Cusack, Carmichael, Crampton, Colles, and others, which I have had the pleasure of looking at in that record of presidents which greets one on one's entrance into the hall, have shed their lustre on this institution, and on the degrees and instruction which it has conferred; and behind those great names there has followed a band of, perhaps, less distinguished, but not less laborious students, who have gone forth into the arena of life after having studied that frame of ours which is so wonderfully and so fearfully made, and who have carried the blessings of the healing art into every portion of the globe. It is not only in the hospital and in the sick chamber that those qualifications are exhibited. The ranks of the naval and military services are largely recruited from those who have pursued their education within those walls. The prosperity of the institution needs little to assure it. Its antiquity is known to us, and its history, to which eloquent reference has been made by the president, is before us. It needs little more to assure it; but still, if anything were wanting, nothing could be more appropriate than these new buildings, which in their permanence, will be a symbol of its own permanence, while they minister to its prosperity and utility. Mr. President, you have alluded to the legislation which has been before Parliament. I believe that at one moment of that proposed legislation a certain danger, through misapprehension and some mistakes in the provisions of that measure, was incurred, and it is owing to the gentlemen connected with the Royal College of Surgeons and the Royal College of Physicians, who, at great personal inconvenience,

visited London, and represented the facts to the Government, that those facts were properly brought before them; and I am quite sure that I only speak the feelings of my colleagues when I say that it was only necessary to bring before them the danger that might have been incurred through those provisions, in order to have that danger removed. I beg now to declare this building open for the future use of the Fellows and Licentiates of the Royal College of Surgeons of Ireland.

The proceedings then terminated.

Medical News.

University of London.—The following candidates have passed the recent first M.B. Examination:—*First Division.* Bowe, Francis, Cantin, Louis Alfred, Cuffe, Edward Meade, Day, Donald Douglas, Graham, Albert William, Jones, Robert, King, David Alexander, Kirsopp, Thomas, St. Bartholomew's Hospital; Dickinson, Thomas Vincent, Weber, Charles Alfred, B.A., B.Sc., St. George's; Chisholm, William B.A., Sydney, Colborne, William Wriothesley, Horsley, Victor Alexander Haden, Maudsley, Henry, Mott, Frederick Walker, Murray, Hubert Montague, Parker, William Rushton, Parkes, Louis Coltman, Pasteur, William, Permewan, Arthur Edward, Pratt, Reginald, Shearman, Percy Edward, University College; Newsholme, Arthur, Shaw, John, St. Thomas's; Rake, Beaven Neave, Guy's; Cox, Frederick Augustus, St. Mary's; Hoole, Henry, Charing Cross; McDonnell, Denis, King's College; Bassett, Henry Thurstan, Queen's College, Birmingham, and Guy's Hospital; Bredin, Richard, Honeyburne, Richard, Liverpool Royal Infirmary School of Medicine; Maguire, Robert, Owen's College.

Second Division.—Collins, William Job, Groom, Henry Thomas, Rice, Edward, Smith, Henry, Sykes, William Ainley, Tait, Edward Sabine, Thomas, Walter Duncan, St. Bartholomew's Hospital; Marsh, George Ryding, Oram, Richard Rundell William, Guy's; Ballance, Charles Alfred, Swale, Harold, Walters, Frederick Pufenacht, White, Charles Haydon, St. Thomas's; Atmaram, Anundrao, B.Sc., Dallmeyer, Andrew, William, Donovan, Denis William, Hoskyn Donald Templeton, Routh, Amand Jules McConnell Squire, John Edward, Watkins, Christopher James, University College; Davidson, John, Silk, John Frederick William, King's College; Collingwood, David, Liverpool Royal Infirmary School of Medicine; Hurst, George, B.A., Sydney, University of Edinburgh; Brooke, Henry Ambrose Grundy, B.A., Owen's College.

Excluding Physiology.—*First Division.*—Barnes, George Frederic, St. Bartholomew's Hospital; Sellers, William, University of Edinburgh.

Second Division.—Whiting, John, St. Bartholomew's Hospital; Smith, John, Guy's.

Physiology only.—*Second Division.*—Fooks, George Ernest, Hughes, Richard, Roeckel, Waldemar Joseph, St. Bartholomew's Hospital; Crisp, Thomas, St. Thomas's Hospital; Suckling, Cornelius William, Birmingham School of Medicine.

Royal College of Surgeons of Ireland.—At an examination held at the Royal College of Surgeons, Ireland, on the 2nd and 3rd of August, Kendal Franks, M.D. Univ. Dub. was admitted to the Fellowship of the College.

Army Medical Department.—List of candidates for commissions as Surgeons in Her Majesty's British Medical Service who were successful at both the London and Netley Examinations.—August, 1878.

VACANCIES.

Cranbrook Union.—Medical Officer. Salary, £55, with the usual fees extra. Applications, with testimonials, to the Clerk by August 7.
Cumberland Infirmary.—House Surgeon. Salary, £100, with board, &c. Applications to the Rev. A. Edwards, Ash House, Carlisle, by September 19.
Dorking Union.—Medical Officer and Public Vaccinator. Salary, £95, with fees extra. Applications, with testimonials, to the Clerk on or before September 4.
Droitwich Union.—Medical Officer. Salary, £120, with fees extra. Applications, with testimonials, to the Clerk to the Guardians on August 20.
Kent and Canterbury Hospital.—Assistant House Surgeon and Dispenser. Salary, £50, with board, lodging, &c. Applications, with testimonials, to be sent to the Secretary on or before August 23.
Lincoln County Hospital.—House Surgeon and Apothecary. Salary, £100, with board and lodgings. Election, September 5.
Machynlleth Union.—Medical Officer. Salary, £36, exclusive of extra fees. Applications, with testimonials, to the Clerk by August 21.
North Staffordshire Infirmary, Hartshill,—House Surgeon. Salary, £100 per annum, increasing £10 per annum, with furnished apartments, board, &c. Applications to the Secretary not later than August 28.
St. Pancras, Middlesex.—Medical Officer for No. 4 District. Salary, £110. Applications (to be made on forms provided for the purpose), with testimonials, to be sent to the Clerk to the Guardians, Vestry Hall, St. Pancras, not later than August 26.
Staffordshire General Infirmary.—House Surgeon and Secretary. Salary, £100, with board, lodging, &c. Applications, with testimonials, must be sent to the Secretary on or before August 22.
West Herts Infirmary, Hemel Hempstead.—House Surgeon and Dispenser. Salary, £100, with board, &c. Applications, with testimonials, to the Secretary on or before September 5.

Birth.

Smyly.—August 3, at 4 Merrion Square North, Dublin, the Hon. Mrs. Smyly, of a daughter.

Marriage.

O'Flynn—Mullins.—August 5, at Dublin, Phillip O'Flynn, M.D., Knt. Ord. P. IX., Knt. Ord. Greg. Mag, Surgeon Major in the Pontifical Army, of Glencairn Lodge, Lismore, to Mary Josephine, only daughter of the late Anthony R. Mullins, Esq., of Ashley Park, Galway.

Deaths.

Barker.—On August 3, at Hungerford, Berks, Richard H. Barker, M.R.C.S.E., aged 68.
Burnup.—On August 5, at Derwent Place, Newcastle-upon-Tyne, Martin Burnup, M.D.
Hunter.—On August 8, C. Hunter, M.R.C.S., son of the late Dr. J. C. Hunter, Wilton Place, aged 43.
Ireland.—On July 26, at Linton, Edward Ireland, M.R.C.S., aged 40.
Lawton.—On July 16, on board the *Taymouth Castle* (homeward bound), Dr. Joseph Lawton.
Parratt.—On July 31, at Victoria Road, Charlton, James Edward T. Parratt, M.R.C.S.E., Inspector-General, Army, aged 71.
Pattullo.—On August 2, at The Manse, Parton, N.B., William Pattullo, M.D., Staff Surgeon, R.N., aged 40.
Ross.—On August 2, at Nowgong, Bundercund, India, Richard Edmund Ross, L.K.Q.C.P.I., Surgeon, 20th Madras Infantry.
Young.—On July 29, at Olney, Bucks, Henry Young, Surgeon, aged 58.

THE MECHANICAL SYSTEM OF UTERINE PATHOLOGY. (a)

By GRAILY HEWITT, M.D. Lond., F.R.C.P.,
President of the Harveian Society, &c., &c.

LECTURE I.

MR. PRESIDENT and GENTLEMEN,—The subject which I have selected for these lectures is one which I venture to think very suitable for discussion before this Society. Great scientific interest at present attaches to all questions relating to the pathology of the uterus. We have been too long reproached for the diversity and differences of opinion prevalent on these questions, and I feel sure you will bear with me in the attempt I am now about to make to reconcile these differences and to produce some satisfactory and useful generalisations on the subject. For several years the complex subject of uterine pathology has been a principal object of my attention. Starting with no preconceived views on the subject, my sole object has been to attain to a rational understanding of the cases which presented themselves to my notice. The result of my observation and inquiry has been the adoption of certain general principles in reference to this interesting subject, which have, as I conceive, a very widely extended application, and which I shall now endeavour to lay before you. The principles in question have evolved themselves naturally and logically from the facts before me. They seemed to me of so sweeping and general a character, that at first I was distrustful of my own observation, and could hardly believe that such simplicity belonged to a subject which had always appeared so difficult; but as time went on, it was plain that there could be no mistake about it, and the more cases I saw, the more exactly and truly did the principles in question seem to apply themselves naturally to the observed fresh facts.

It was not until five years ago that I ventured to put forward in a succinct and positive form the conclusions which observations spread over several years had previously induced me to come to. In the third edition of my work "On Diseases of Women," these conclusions were submitted to the consideration of professional brethren, as the basis of what I ventured to designate the "mechanical system" of uterine pathology.

The following three propositions embody these conclusions:—

"1. Patients suffering from symptoms of uterine inflammation (or, more properly, from symptoms referable to the uterus) are almost universally found to be affected with flexion or alteration in the shape of the uterus of easily recognised character, but varying in degree.

"2. The change in the form and shape of the uterus is frequently brought about in consequence of the tissues of the uterus being previously in a state of unusual softness, or what may be often correctly designated as chronic inflammation.

"3. The flexion once produced is not only liable to perpetuate itself, so to speak, but continues to act incessantly as the cause of the chronic inflammation present. (a)

Since that time nothing has occurred to shake my confidence in the substantial truth of the conclusions just stated; I have had, on the contrary, more reason than ever to be satisfied of their accuracy. But additional experience, together with the great advantage of the subjection of these conclusions to various searching, if not always favourable, criticisms, enable me now to develope the subject more completely.

There has been much misconception in reference to the word "mechanical," as used in the phrase "mechanical system of uterine pathology," a misconception which it is necessary that I should at once deal with. The word mechanical is here employed to convey an idea as to the origin and nature of the disorder. By it is meant that

(a) Being the Harveian Lecture delivered before the Harveian Society of London, December, 1877.

(a) "On the Pathology, Diagnosis, and Treatment of the Diseases of Women." P. 2. Longmans. 1872.

mechanical changes and mechanical influences have the greatest share in the production of these disorders. By it is intended to be conveyed the importance of the share which acquired distortions and alterations of position of the uterus—in a word, mechanical changes—have in the production of uterine suffering. The word mechanical has, however, apparently led some who have criticised the doctrines which I have upheld, to imagine, quite unjustifiably, as I shall by-and-by show, that it has been my intention and desire to inaugurate the universal and indiscriminate employment of instruments and mechanical appliances in the treatment of uterine disease. Nothing can be farther from my intention. At present I content myself with simply pointing out that the adoption of the mechanical system of uterine pathology does not mean the use of a pessary in any and every case that presents itself. It is one thing to recognise that the patient before us is suffering from a mechanical derangement of the internal generative organs, it is another to insist on the treatment of such a case by applying various internal mechanical apparatus.

It is high time that some more rational, intelligible, and generally comprehensible ideas on the subject of uterine pathology should prevail. Knowledge has in this department of science, been defective. The subject is one which cannot be studied on a large scale by a large number of individuals, and the great mass of the profession has felt itself obliged to accept the reigning doctrines, and apply them as they best could to the treatment of actual cases. The breakdown of one system has thus disposed many to think hardly of a new one, and to exclaim against a novelty simply because it is a novelty. I gladly avail myself of the opportunity now offered of presenting to your notice a general view of the mechanical system of uterine pathology, and of setting forth the grounds on which it claims to offer a rational interpretation of the clinical phenomena, and the pathological changes observed in cases where the uterus is diseased.

Certain of the mechanical disturbances of the uterus have been long known, their nature understood, and their inconveniences recognised. I mean those forms of prolapse uteri where the organ, wholly or in part, and dragging with it or not portions of the adjacent organs, protrudes from the vulva. There is no dispute as to the mechanical nature of such a lesion as this. The malady could not well escape recognition.

But displacements of the uterus falling short of this external protrusion were not so readily recognised, though a moment's consideration would seem to be sufficient to show that a descent or movement transgressing the normal limits would be really a displacement. In point of fact, the slighter displacements were known to exist, but were not thought much of, because no one had specifically indicated the nature of the evil effects they produced. But, besides these slighter degrees of internal displacement, another physical change of the uterus—bending or flexion of the organ—has of late years attracted much attention. It is plain that this latter is a mechanical affection, and that it must be looked at from a mechanical point of view. It is not less a dislocation than is prolapse of the uterus.

The proper signification of these various mechanical diseases of the uterus is not yet known, nor is their relation to other diseases and alterations of the uterus as yet defined with the necessary degree of precision. Almost inconceivable differences of opinion prevail as to their nature and effects, and there are infinite differences of opinion as to their actual importance. It is my object on this occasion to attempt to render the matter more intelligible.

The importance of this or that lesion of any particular organ is usually judged of by its disturbing effect, by the pain or discomfort to which it gives rises, or by its disturbing various physiological processes essential to the preservation of health. Observation has convinced me that as a rule, far too little attention is bestowed by practitioners on the statements and complaints made by patients as to their own painful or distressing sensations. I can only say that, in investigating supposed cases of uterine disease, I have always gained a great amount of assistance from these statements in arriving at a conclusion as to the nature of the case. Earlyin my practice I was led to adopt the course of questioning patients closely in regard to their sensations. Coupling these statements with the results of careful internal exploration of the uterus, and other adjacent organs, the result was in process of time to show such a close connection between internal mechanical changes of the uterus and the existence of painful sensations such as induced the patients to apply for relief, that I was insensibly led to attach the highest importance to this connection. And, in fact, this is the explanation I have to give of my adoption of the mechanical system of uterine pathology, that clinical evidence and clinical facts not only indicated these conclusions, but forced them upon me.

Frequency of Uterine Distortions.

Let me, in the next place, lay before you a brief statement of facts bearing on the question of the actual frequency with which the mechanical diseases of the uterus are met with in practice. I am quite aware that "frequency" is not necessarily identical with "importance." But for the moment I direct attention to the frequency question. During a period of a little over four years, from August 1865 to December 1869, I kept notes of all cases treated in my out-patients' room at University College Hospital. The number of recorded cases of all kinds is 1,205. Of these, 714 were cases where the patients presented uterine symptoms. Of these 714, 620 were subjected to an internal examination, and the diagnosis thus arrived at. In 94 no such examination was made.

Of the 620 examined cases, 61, or 9·8 per cent., were set down as suffering from absence or malformation of uterus, or various symptomatic affections only.

In 182, or 29·3 per cent., the patients were found to be suffering from fibroid tumour, cancer, or pelvic cellulitis.

In 377, or 60·8 per cent., the shape of the uterus was materially changed, or its position markedly changed.

These 377 cases are further resolved into—

Flexions	Retroflexions, 112 / Anteflexions, 184	296	377
Prolapses	- - - -	81	

Further, "the flexion cases were very generally attended with alterations such as would be properly termed as of a chronic inflammatory character; but it is precisely in those cases where the symptoms of irritation or inflammation were most marked that severe and well-established flexions were found to exist." (*a*)

It thus appears that in 60·8 per cent. of these hospital out-patient cases which presented uterine symptoms of sufficient importance to suggest the necessity for making an examination, marked physical changes in the form, shape, or position of the uterus were detected.

The total number of cases recorded was, as I have before stated, 1,205, of which 714 are accounted for in the above analysis. There remain 491 cases, which include many of syphilis or gonorrhœa, pregnancy, general debility, over-lactation, diseases of the bladder or external generative organs, phlegmasia dolens, tumours or inflammations of the ovaries, cases of doubtful diagnosis, cases of disease of other than the generative organs, &c.

The above is an exact account of observations made and recorded in public. Before the observations in question were made I had been led to regard alterations of shape of the uterus as of high clinical importance. But these observations, made between 1865 and 1869, are more reliable than any previous ones, for the reason that they were made by a more experienced observer. The generalisation arrived at from a careful analysis of these cases is embodied in the three propositions already alluded to.

These statistics were valuable in my own estimation. But no statistics are of themselves quite capable of settling any question in an indisputable manner, it being always open to an objector to state that in other hands a very different result could have been shown to be deducible.

(*a*) "On the Pathology, Diagnosis, and Treatment of the Diseases of Women," p. vii. Third edition.

In endeavouring to demonstrate, therefore, the importance of these mechanical diseases of the uterus we must appeal to reason as well as to statistics. These ideas must in fact be shown to be in accordance with anatomy and physiology. They must also be shown to offer an intelligible explanation of clinical phenomena, and there must be such a conformity between them and the daily observed facts as will convince the inquirer that the ideas in question rest on a scientific as well as a clinical basis.

FIG. 1.

Fig, 1 represents the normal position and relations of the virgin uterus.

Mechanics of the Uterus.

I propose, in the next place, to consider the mechanics of the uterus, for it is obvious that accuracy of knowledge of this subject is an essential preliminary to the matter before us.

Those who regard the uterus as a part of the body subject only to general influences, and participating in the effects of those general influences in common with the other organs of the body, will naturally have little sympathy with any disquisition on the subject of the mechanics of the uterus. But the uterus is subject to the action of mechanical laws, and it is impossible to escape from the necessity for making due allowance for their operation in the construction of a rational system of uterine pathology.

Nature has so placed the uterus that it is comparatively well protected from accident. It is fixed in such a manner that it yields a little to forces which may be so applied as to change its position. Downwards, and forwards, and backwards, and even upwards, the uterus may be, to a certain extent, moved without injury or inconvenience. Various strong forces, however, are capable of dislocating it severely. The soft but elastic connections of the uterus are very numerous, and the relation of the organ to adjacent ones is such that motion is comparatively restricted.

But while motion of the uterus, as a whole, is comparatively restricted, motion of certain parts of the uterus is more free. The centre of the uterus, with its axis of suspension, is more fixed, but the body and cervix are more free to move backwards or forwards. And if the uterus were a rigid organ, various forces would obviously easily produce a tilting or version of the uterus, the fundus going forwards and the cervix backwards, or *vice versâ*, according as the force was applied at the back of the fundus or at the front of the fundus uteri. The body of the uterus particularly is very free to move backwards and forwards, this part of the organ having little to fix it, so far as the ligaments or attachments of the uterus are concerned. The amount of motion enjoyed by this part of the uterus in a state of health is probably not a great deal. Probably about an inch and a half represents the variation of the top of the fundus uteri in health, this variation being dependent on the fulness or otherwise of the intestines posteriorly, and of the bladder anteriorly.

(To be continued.)

AFTER giving a description of the new waterworks at Sandringham, the *Sanitary Record* remarks it will be evident that no private house in Great Britain has a better supply of water for all purposes than that now possessed by Sandringham. It is much to be desired that the example set by the Prince of Wales in matters of sanitation may be followed by all the great landowners throughout the country.

b

ON THE ADULTERATION OF DRUGS.

By CHARLES R. C. TICHBORNE, LL.D., Ph.D., F.C.S., &c.

In considering the adulteration of drugs, three points naturally present themselves for consideration, namely, the bearing of the Adulteration Act upon the question. 2ndly. The bearing of the question itself upon the practice of medicine; and lastly, the moral responsibility of the Pharmaceine in connection therewith.

In disposing of the first of these points I wish to confine myself to a few remarks, as it is impossible to go into the merits of the Act, or Acts in the time at my disposal. Any unprejudiced observer, however, must be alive to the fact that as regards drugs and chemicals, the Adulteration Act is a failure—particularly the first—and also to the fact that in two cases out of three the analyst appointed under that Act has never received the peculiar education necessary for such a post. It requires not only considerable ordinary analytical experience, but also that rare practical training in connection with the apothecary, or pharmaceutical chemist, which is generally wanting. There are exceptions to the rule as regards my remarks about competency, and Dublin and London may be instanced as notable examples of these exceptions.

There is a general notion that it is the most expensive drugs and chemicals, such as saffron, scammony, quinia, nitrate of silver, that are commonly adulterated. There are no doubt many such cases; but as details of these examples would be more than twice-told tales, it is not my intention to weary you by repeating them.

In the following examples, however, I wish to bring before you a few adulterations which I have picked up lately in the course of my experience. They are in a degree typical, and also illustrate the fact that adulteration is perhaps even more extensively carried on with cheap drugs than dear ones. I have been informed on good authority that powdered hæmatite—red iron ore—is frequently sold as the peroxide of iron. It is still a favourite remedy, particularly among amateur doctors; and as the pharmacopœial article is only worth a few pence per lb., a variable rock with various proportions of oxide of iron—10 to 70 per cent.—should not be substituted for it. I am not, however, prepared to vouch for the correctness of this statement from actual observation; but the instances I am now about to mention are some that have come under my own immediate notice, and which I am now in a position to bring before you.

Phosphorus and nitric acid are not very dear substances, and therefore we would suppose that a preparation like phosphoric acid would always be made, as directed, from those chemicals, particularly when sold as the British Pharmacopœial acid; but I place before you a specimen of the so-called B. P. acid which is made from bone ash and oil of vitriol. On reference to Watt's "Dictionary of Chemistry," vol. iv., pages 500 and 544, it is there stated that a very pure acid may be obtained by treating bone ash with oil of vitriol, repeatedly treatment with H_2SO_4, evaporation, and other manipulations not necessary to specify in this paper. The writer says, after describing the process—"The filterate, when boiled, constitutes a solution of ortho-phosphoric acid, contaminated with a trace of sodium, but otherwise pure." Now, whether it is possible to remove the whole of the lime and magnesia by easy and cheap means, I am not prepared to say. It is evident that by treating the phosphate directly by sulphuric acid, the first stage is to remove only $\frac{1}{3}$ of the calcium, as is evidenced by the following equation—

$$Ca_3(PO_4) + 2H_2SO_4 = CaH_4(PO_4)_2 + 2CaSO_4$$

But, as far as I can see, the sample of so called phosphoric acid under examination is very little removed from the acid solution represented by the above equation, and more exactly represents the biphosate of lime of the manure-makers than the Pharmacopœial acid. It gave a voluminous precipitate on adding chloride of ammonium and carbonate of ammonia, and also contained appreciable quantities of magnesium. Here we have a chemical product cheap in itself, cheap as regards the sources from which it is procured, and yet "it shall not escape calumny." The doctors' dose—30 drops—is not much, and yet it must be cheapened for the commercial greed.

Lint-seed is a very cheap commodity, owing partially to the extensive cultivation of the plant for flax and other purposes, and also because, as regards the seed, we utilise the whole of the residue after expressing the oil. After getting the latter valuable product we have the linseed cake, also valuable as a cattle feeder, which, when ground, is prized by the medical man for its emollient properties. Well may the plant be called *Linum usitatissimum*. Of such universal application is this substance that it becomes important that we should have it extremely pure and free from extraneous matter. Yet even the cheapness of this commodity has not saved it from the adulterator's hands. Extensively as it is pressed for oil, grapes are much more extensively pressed for wine, and, unfortunately, the wine grower cannot utilise the produce of his wine-press except for manuring his vine-yard; therefore the wine-press residue may be practically considered as a dead loss. but one ingenious wine-grower bethought himself that, as he had a press, it was only necessary to add a little linseed farina to grape residue to produce a very presentable linseed cake, as far as the eye went. I show you now specimens of linseed cake manufactured abroad, in which the residue of the grape, stones and stalks, can be easily recognised by a very low power of the microscope.

I was rather amused by a late number of the *Pharmaceutical Journal* calling attention to a paragraph in the *World* of July 31. The writer in the *World* points out that the well-known drug colocynth is an indigenous Cyprian plant, and imported at a shilling a pound. "No wonder," he says, "apothecaries and chemists make fortunes when we see what we have to pay for a few pills containing a few grains of it." Now, like all gentlemen who go out of their sphere, he makes a mess of it. He is evidently ignorant of the fact that of the five ingredients of the pill he has pitched upon one of the cheapest, whilst it contains double the quantity of scammony, a very expensive drug. The writer having been so successful in finding the word colocynth in some encyclopædia, comes to grief in the Pharmacopœia, he has got from the shoe-latchet to Appelles' legs, *Ne sutor ultra crepidam*. How much more surprised would he be to hear that the wonderful drug that costs so little is extremely difficult to procure in commerce in a state of purity if we are to take the Pharmacopœia as a standard. The official part of the colocynth is, as expressed in the Pharmacopœia, "the dried decorticated fruit freed from seeds."

Now, we have in commerce three articles, none of which represent the colocynth of the Pharmacopœia. The colocynth-apple may be anatomised into the rind, pulp, and seeds. Although Pereira says "that the seeds are bitter as found in commerce, and that a scruple will act upon a dog." This bitterness is only skin-deep, and is more strikingly observed in the dry pulp than in the fresh fruit, the seeds of which are stated to be an article of food in North Africa.

The albumen of the seed is perfectly tasteless. If we wash the seed for some time and th try it, we shall find that the seed is nearly free from bitterness, and *ergo*, the seed contains no colocynthin. These remarks also apply to the rind, although in a somewhat less degree. Therefore, I maintain that as these parts are inert, it is as much an adulteration to sell such an article for the medicinal powder as a direct adulteration with starch would be. It is another method of lowering the price at the expense of quality, and constitutes a system adopted in more drugs than *Pulv. colocynthides*.

I have carefully anatomised a colocynthin apple, and find that it consists of—

Seeds (inert)	47·19	per cent.
Rind (nearly inert)	33·78	„
Pulp	19·03	„
	100·	

So that if we take Meissner's analysis, which states that colocynthin pulp only contains 14 per cent. of colocynthin. We shall be astonished at the small amount of colocynthin in some commercial samples.

	Per cent. of active principle.
Pure sample	14·3
Turkey pulp ground without removing the seeds	4·2
Colocynthin ground with rind and seeds	2·6

In a substance in which the medical man depends upon a dose of 2 to 8 grains, this presents a wonderful range of active principle, from 14 per cent. to 2½ per cent.

The samples exhibited to this meeting were all in commerce. One is a sample of the very best average quality, but still containing a very large proportion of seed; in fact, it is very seldom without indications of the presence of that substance, and I believe it is generally the practice to powder the colocynthin pulp with the seeds remaining in it.

The second sample is one which is much darker in colour, and consists of the whole colocynthin apple ground. The third sample is not only the whole colocynth ground up, but a sufficient quantity of potatoe starch added to make the colour light—as well as being a profitable transaction. A medical man, indeed, prescribing 8 grains of such a powder, would be disappointed in the results.

The second point of the adulteration question, viz., its bearing upon the practice of medicine has been indirectly touched upon, and is, perhaps, more strikingly viewed from the consideration of the adulteration of very active drugs, such as opium, chloral hydrate, &c. We all know the acknowledged superiority of the English made alkaloids over the foreign. Some time since, I had to perform experiments, pathologically and otherwise, with atropia. The English specimen (specially manufactured by Messrs. Hopkins and Williams) proved itself at the lowest computation six times as strong as the German. How is the physician to regulate his dose in such a case where 1-50th of a grain will produce a marked result.

As regards the moral responsibility, I wish emphatically to express my conviction that the control of drug adulteration must come from the pharmaceutical chemist himself. In time, the public analysts will be selected from this body, and if he once realised his great responsibility, and it is a very great responsibility, he will be able to control the manufacturer. He is much more than an ordinary trader. He has been declared to have an education outside the three R's, and outside his buying and selling. This in itself is a responsibility. If he says I must have a colocynth, which represents 14 per cent. of active matter, get it how you like, the manufacturer or grinder will supply it. He, the Pharmaceine, will satisfy the doctor—the public in years to come, will learn to appreciate him—but best of all he will satisfy his own conscience.

Nought's had, all's spent—
Where our desire is got without content.

ON DIAGNOSIS OF ENLARGED GLAND SIMULATING HERNIA.

By DR. G. DE GORREQUER GRIFFITH,
Senior Physician to the Hospital for Women and Children, Consulting Physician-Accoucheur to St. Saviour's Maternity.

The following case I publish, with the full permission of my colleague.

Mrs. Smith, æt. 66, presented herself amongst the out-patients, complaining of a "rupture in the right groin," attended with considerable pain and tenderness; which, she said, came on after over-straining herself by carrying a scuttle full of coals up stairs. She had applied at a Provident Institution, where a truss was supplied to her a few days before she came as an out-patient to Dr. Folwell. She then stated that she was no better, but rather worse, since she had worn the truss, pain having become so great that she could hardly bear the instrument. Acting on his advice, she went to the charity whence she had obtained it, and there it was considered that much of her distress was due to her wearing the truss *while the bowel was down*—that is, unreduced—and that her symptoms were so grave as to need her admission into hospital at once. Accordingly she was taken into the Hospital for Women and Children without delay. As my colleague had to go to the country he asked me to see her. I found her greatly agitated and alarmed lest she should have to be operated upon, but the urgency of her symptoms had diminished, and the bowels had been moved daily by the castor oil which Dr. Folwell had ordered her to take every morning. On examination I found a swelling in the groin of about the size of a large walnut cut in halves; this, I determined by careful examination, did not lie in, or in any way communicate with, the inguinal region proper; the ilio-pubic rim and Poupart's ligament being distinctly made out, as well as that the inguinal rings were free, *i.e.*, not engaged by this swelling, or by any protrusion. Moreover, the lump could be distinctly moved, but more readily downwards, towards and into the region of femoral hernia, than upwards into the inguinal rings. At this examination I ascertained there was no inguinal hernia to deal with; yet I could not determine whether femoral rupture did not exist, having understood that Dr. Folwell and the Provident Charity medical officer had pronounced the case to be one of irreducible and possibly strangulated hernia; and finding, as I did, some points complicating diagnosis. Minute examination enabled me, by sinking the fore and middle fingers into the crural ring, to feel something exceedingly like a neck to the tumor, but doubting whether a rupture existed at all, I gave it as my opinion, that if one were present it was not an inguinal, the resemblances being more to a femoral—that it was too moveable and too hard to be a *strangulated* knuckle of intestine, especially as the hardness is unaccompanied with any grave signs. Grouping the symptoms therefore, it seemed that an enlarged gland was really what was before us, and the redness of skin and tenderness on palpation led to this conclusion, even though the last two named symptoms might be met with in a case of strangulated, irreducible hernia, more particularly if the truss had been improperly worn. We decided to keep her in bed, and wait for further development of symptoms, nothing being now urgent; continue the oil, so as to ensure the action of the bowels, and let her have a hot sitz bath each night; give fluid diet, soothing medicine internally; and externally a lotion of aconite and laudanum tinctures, in equal parts. Next day the swelling was increased to quite the size of half a small orange, was softer, and gave a sensation as if omentum lay beneath, and, I am bound to say, there were more of the semblances of inguinal rupture than before. So completely was the entire appearance altered that I should not know I was examining the same case, the small hard tumour had yielded to a soft and somewhat resilient, and much larger one—of the size I have just stated; nor was it limited to the crural region, but, passing up from it in front of the pubis, it came to occupy the position of an inguinal protrusion, so that were the case now seen for the first time it might have been exeeedingly difficult to pronounce a determinate diagnosis, whether a direct, or oblique, irreducible inguinal rupture existed, or an irreducible femoral which, having forced its way more to the surface than it had when first seen, afterwards had turned upwards, till it engaged the site of an inguinal protrusion. Still the swelling could not be pushed down in the course of a femoral hernia, nor in the direction of an oblique

inguinal; the redness of the skin, and the tenderness, were less; the mass was readily moved under the integument, though not returnable through any opening. As there were no urgent symptoms, and none whatever of strangulation, I still advised continuance of all the treatment already pursued. I did not see the patient for some days, and then the swelling had diminished very much, even to smaller dimensions than when I had first seen it, and had, as it were, subsided into the crural region.

On the occasion of my last visit I had found great irritation in the rectum, and so much tenderness, that I no longer hesitated to affirm, I considered the case to be one of gland enlargement, dependent on the condition of the rectum, a condition of such constant irritation that it had almost occasioned suppuration of the gland.

Mr. Adams saw her in consultation with Dr. Folwell and myself, on April 20th, and after hearing a *résumé* of the history of the case, and carefully examining her, he came to the conclusion that the tumor was not a knuckle of intestine, though it closely simulated it, but was more probably an enlarged gland; moreover, he said, it was too hard to be the former, and that if anything like such hardness existed there would be very much more constitutional disturbance, and that there was also too much mobility of the swelling for prolapsed intestine which, if it could be moved about like this, would not remain the same shape and size after being thus moved, for in such movement the intestine (if it were so) would be dragged out of the ring (and might not afterwards be returnable) and in this manner an alteration in shape and an enlargement in size would be produced. The condition of the rectum also helped to determine the diagnosis in favour of an enlarged hard gland.

Mr. Adams advised continuance of the treatment as already ordered, aud that the symptoms should be carefully watched.

Saturday, April 28th, I again saw her, and for the first time a number of small glands were to be felt in the immediate vicinity of the swelling, as though a chain of them had been formed, and that the one now under special consideration was the largest link.

The end may be thus summed up—rest in bed, relief of the condition of the rectum, and the local application of dispersives, such as unguent hydrarg. and compound tincture of iodine, brought about the objects sought to be obtained by the treatment, so that before she left the hospital all her symptoms had completely disappeared.

BRITISH MEDICAL ASSOCIATION.

ADDRESS IN MEDICINE.

By HENRY F. A. GOODRIDGE, M.D., F.R.C.P.,
Senior Physician to the Royal United Hospital, Bath.

THE PATHOLOGY OF FEVER.

(*Continued from page* 122.)

But we hasten to the subject of fever. The regulation of heat, we know, is not annulled in fever. It is performed more feebly than in health, but its great and important characteristic is that it is set at a higher degree of temperature. The view that has been taken of the share of the musculature in the production of the normal body-heat, would suggest that in the production of the abnormal heat of fever, we have to do with an inordinate activity of the same tissue. The state of the *voluntary* muscular energy, as we are all aware, is one of marked depression from the first. General debility, impairment of active working power, and indisposition to move, are among the earliest symptoms; but the sensation of weariness and languor, notwithstanding complete rest of the body, and the aching and feeling of soreness in the limbs, may well be regarded as signs of over-exertion, of excessive work of the musculature during suspended volitional activity. The clinical phenomena and pathological alterations have for some time past led observers to recognise that the muscles play a very prominent part in the febrile process. Attention was especially directed to this fact by our late illustrious countryman, Parkes, who pointed out that the muscles are the chief source of the increased production of urea. But we have some additional experimental evidence. Samuel has shown that, whilst in animals in which fever has been artificially produced, location for some time in cold air caused their temperature to sink only a little; in animals similarly treated, who had the four main arteries of their extremities ligatured, or the nerve-trunks of their extremities divided, a very considerable sinking of temperature rapidly ensued. Thus the seat of the heat-production in fever does not seem to be other than in health. In both conditions, upon the musculature is the heat-production incumbent. That this itself undergoes an *increase*, the researches and calculations (calorimetric and by determination of carbonic acid excreted) of Leyden, Liebermeister, and Immermann, must be held to have sufficiently proved.

The experimental study of fever with antipyretics—a new field of inquiry—has recently been undertaken by Carl Emil Buss of Basle, who, we may remark, was one of the first, if not the first, to introduce salicylic acid in the treatment of acute rheumatism. To determine the influence of the antipyretics, either heat discharge or heat production might serve as the starting point of the inquiry. The determination of the heat-discharge is attended with difficulties. It was found simpler and safer to determine the heat-production within the time in which the fluctuations of temperature occur, since this indirectly permits also a judgment concerning the amount of the heat-discharge, and disturbing influences are much more easily avoided. The determination of the excretion of carbonic acid was adopted as being the best criterion of the heat-production of the body in investigations of the kind. The method employed was the same in principle as that of Liebermeister's—viz., placing the patient either recumbent or sitting during the period of observation in a box or small chamber, especially contrived for the purpose. I described this in my former paper. Buss's apparatus differed only in its being furnished with a more complicated system of tubes, designed to give increased accuracy to the results. The antipyretics used were the sulphate of quinine, the salicylate of soda, and the creosotate of soda. The last mentioned is not much known in this country, but is, I believe, both chemically and therapeutically allied to the salicylate. The object was to ascertain what alterations the heat production undergoes when the febrile regulation of heat passes into the normal, that is, when the heat regulation of the fever patient is set to that of the healthy person. The result was quite unexpected; viz., whereas under the influence of quinine a considerable diminution of the carbonic acid production occurred, after the administration of salicylate of soda or of the creosotate, the carbonic acid production continued unaltered as it was before; that is to say, that while both medicaments brought down the temperature much alike, and to the extent of 2 deg. Cent. and upwards (3 deg. to 4 deg. Fahr.), in two or three hours, the quinine reduced the carbonic acid production considerably, but the salicylate left it unaltered. Now this negative, but definite, result of the salicylate, it will be observed, carries with it a positive conclusion of pathological importance; viz,, that by heat-discharge alone, and without diminished heat production, the resetting of the heat-regulation to the normal temperature can be effected. With reference to the quinine, the results are indefinite, and allow the supposition, favoured by other considerations, that along with the diminished heat-production increased heat-discharge is co-operated.

But further, Buss argues that during the fever itself, the heat-discharge must have been *relatively* diminished, although *absolutely* (as has been shown by Leyden) in excess; otherwise, by the law of compensation, the temperature must have returned before to the normal. The fever patient does not give out as much heat as corresponds to his higher temperature. He has, in short, retention of heat. Hence Buss arrives at the conclusion that the febrile elevation of temperature is determined essentially by an arrest of heat-discharge, but by no means by increased heat-production. A due consideration of the processes concerned in the normal regulation of heat, before referred to, and of their correlation and *modus operandi*, would seem to lead *à priori* to much the same conclusion. That fever does not consist in excess of heat-production alone, the case of tetanus

suffices to show. Here with inordinate muscular activity, persistent tonic spasm, the heat-production is so great that the maximum heat-discharge is inadequate to meet the demand, and a marked rise of temperature ensues; but immediately we succeed by hydrate of chloral or other means, in subduing the reflex excitability, the adjustment is made and the temperature returns to the normal standard. Nor, on the other hand, does fever consist in diminution of the heat-discharge alone, as Traube maintained; the investigations, already cited, of Leyden and Liebermeister have conclusively established the presence of increased heat production. This, indeed, is a phenomenon which appertains to the essence of fever like the arrested heat discharge; but notwithstanding the co-ordination of the two reflex operations, the arrest of the heat-discharge is for the syndrome of fever, and the disturbance of the normal condition determined by it, of so much greater importance that, relatively to the increase of heat-production, it must positively be placed in the foreground. By fever, then, according to Buss, we are to understand that pathological modification regulation of heat of the body, in which with increased heat production there is relatively diminished heat-discharge, whereby the temperature is elevated above the normal standard.

We are brought now to rather to etiological matters; and, in reference to the causes of the febrile regulation of heat, as manifestly new conditions come in to complicate those which obtain in the normal regulation, we have to consider the operation of those agencies which originally call forth the febrile process, and what part, if any, they take in maintaining the same. The ultimate causes of fever, we have come to learn, lie for the most part outside the body. A *materies morbi*, a pyrogenic virus, is taken into it; how, is not sufficiently known; but in various ways we can, in the warm-blooded animal, artificially produce fever. As to the nature of this virus, we need not to be reminded that recent pathological researches have wonderfully enlightened us. We now know that the virulent matter is not in itself liquid, but particulate, composed of corpuscular particles; that it is not matter possessed of peculiar physical or chemical qualities, but that, in many cases at least, it consists of distinct organisms of their germs, capable of development and endowed with the property of self-multiplication. Only in one or two diseases in man, I believe, have specific organisms as yet been actually demonstrated, but the existence of such in others is capable of indirect proof, and in others still is an almost imperative assumption or a more or less probable supposition. Indeed, if we are prepared to go along with an eminent German pathologist, we shall bring into the category of diseases caused by parasitic organisms, not only those just referred to, but nearly all febrile diseases, acute rheumatism, and rheumatic endocarditis, pneumonia, nephritis, tuberculosis, syphilis, &c.; nay, this authority anticipates the time when all infective diseases—among which, of course, he includes those enumerated—will be classified according to the botanical genus and species of the organisms which have occasioned them.

But to return to the pyrogenic virus in its relation to the proximate causation, the mechanism, of fever. Where the virulent particles, the organisms of germs, are deposited until according to the duration of the incubation in each instance they get into the blood, is, except perhaps in the case of one or two diseases, unknown. That they *do* get into the blood before exerting their special activity, seems admitted on all hands. The arrival in the capillary vessels was pretty conclusively shown by Chauveau's "bistourge" experiments. That these virulent particles, moreover—or, if not themselves, secondary particles developed under their influence, products of decomposition—thrown into the periphery of the vascular system, make their way through the walls of the capillaries and diffuse themselves in the tissues, may perhaps be an assumption not unwarranted by the present state of our knowledge. But here, I need not say, we reach its limits. Much prejudice has arisen in some quarters against speculative views in matters of science, but, in my individual opinion, those of original investigators are entitled to attentive consideration, as at least indicating future paths for inquiry. Buss's theory, then, briefly is as follows. According to him, these particles, escaped from the vessels and free in the tissues, exercise an irritating influence upon the terminations of the sensory or afferent nerves: they gradually again are taken up by the lymphatics, and, returned to the venous blood-stream, circulate afresh, reach the periphery, and so on. Thus there occurs a gradual saturation of the entire tissues of the body with these irritating particles, and a permanent irritation of the entire sensory nerve-terminations is kept up. This will tell upon both the sympathetic and the cerebro-spinal afferent nerves. In the former case, constriction of vessels will ensue; in the latter will develop in a reflex way, in like manner as in normal regulation of heat, an increased passive (this word being allowed) or even active muscular activity, and therewith a similarly increased production of carbonic acid. Accordingly there will be persistently maintained a condition of more or less exaggerated contraction of the peripheral vessels, as also of increased production of heat. This excessive vascular contraction necessarily reduces in proportion the heat-discharge. Also the heat-production is no longer influenced alone by the stimulus of cold, but simultaneously by the irritating particles also. Thus the temperature of the body reaches a definite abnormal height, determined by the intensity of operation of the irritating particles, and will remain at the same so long as the irritating operation continues at the same amount. The regulation of heat, moreover, is set accordingly.

It will be seen, then, that by this theory the kind of influence of cold, and of these pyrogenic particles upon the nervous system, is exactly the same. Both effect in the same way peripheral contraction of vessels, and excite the latent muscular activity. But there is yet an essential difference. The operation of the stimulus of cold is, *eo ipso*, always connected with abstraction of heat, a peculiarity which is excluded in the operation of irritating particles. And as the regulation of heat of the healthy person is adapted to the stimulus of cold—that is, to a stimulus attended with simultaneous loss of heat—and can regulate exactly only for this, it answers necessarily to the irritation arising from the pyrogenic particles in like manner as if it were the stimulus of cold. And as with it no abstraction of heat stands in connection, it follows that the temperature of the body must be raised above the normal. Herein, then, according to this authority, lies the true cause of the febrile elevation of temperature, and the essential reason why, with the most heterogenous causes, always one and the same effect ensues, viz., the febrile elevation of temperature.

Samuel's views on the pathology of fever are more readily told. While recognising generally the mechanism of the heat-regulation, before indicated, he holds that certain matters in the blood of a chemical nature, products of tissue-change, concur with the thermal influences (stimulus of cold) in maintaining the reflex ganglionic centres, which he calls "heat centres," and considers automatic, in their normal persistent excitement; and that the essence of fever lies in an excessive production of these matters (Ganglienreize), which is followed by that of similar matters, supposed by him to be the special stimuli of other automatic centres, and thus is determined an over-action, an abnormal tension of a group of centres. Changes in the blood, then, Samuel regards as the essential *point de départ* of the febrile disorder, whether these changes be called forth by the introduction of foreign substances from without or not. He enunciates his theory thus: "Fever depends upon a simultaneously exalted tension of the automatic heat, and heart-centres, and upon an intercurrent one of the automatic vaso-motor nerve centres, and of the ganglia of the sensorium; that this tension, however, is brought about not directly by introduction of pathological nerve irritants, but indirectly by increased production of the physiological nerve stimuli in the blood." Professor Wood, of Philadelphia, U.S., has recently carried out a series of experiments in the dog, on the effects of section of the spinal cord upon the evolution and production of animal heat; but, as far as I can gather from a brief report of the same, with no very novel results. He found, as others have done, that at a low external temperature, after section of the cervical cord, there was increased evolution, with diminished production of heat; while, at a high external temperature, both the production and evolution of heat were diminished. The animal died in winter of cold, and in summer lived much longer on account of the high external heat. Wood attributes the fall of temperature, as likewise others have done, to paralysis of the vaso-motor nerves of the arterioles at the surface removing the restraint upon heat-loss, and this, of course, is one factor in the

result. But the main one is clearly, as Samuel's experiments show, the paralysis of the muscular nerves, and the consequent suppression of the heat-producing processes of the musculature. Here may be the proper place to observe that, neither from these experiments, nor from any other source, is a quite satisfactory explanation yet forthcoming of those rare, but still well-authenticated, cases in which, after accidental injuries of nervous centres in man, or artificial lesions of the same in animals, remarkably high temperatures have occurred, and with a cool surrounding. The possible existence, however, of an inhibitory centre, perhaps in or near the upper part of the cervical cord, has been before duly recognised.

Leaving to others more competent the task of criticism, I may yet be permitted a word or two. It appears to me, then, that Buss has conclusively shown that a *relatively* diminished heat-discharge is an essential constituent of the febrile condition. That the pyrogenic particles, or "irritatants," as he calls them, should select the sensory nerve-endings for their special operation, if ultimately proved to be correct, must at any rate, for the present, be taken as pure hypothesis, and, as far as I know, unsupported by analogy. Samuel seems to regard increased heat-production as predominant in the genesis of fever—this being, as we have just seen, the result of an excessive production of his also hypothetical ganglion-stimuli. He, however, *does* appeal to analogy, citing an observation of Rauke's in the frog—viz., that urea and hippuric acid exercise a direct influence upon Setschenow's reflex inhibitory centre. In the higher animals also, as is well known, the respiratory centre is affected by the condition of the blood; but the analogy hardly serves further, for it has been found that it is not the excess of carbonic acid which affects the centre, but the deficiency of oxygen.

As was intimated at the outset, there are some authorities who do not admit the dependence of fever upon alterations of the nervous system, but contend that it originates in the living tissues, and is from first to last a disorder of protoplasm. This is the view of our eminent English pathologist, Burdon Sanderson, as maintained in his elaborate article in the *Local Government Scientific Reports* of 1875. His argument seemed based very principally upon certain experiments of Murri, a Florentine physician, made upon the dog. Having first divided the cervical cord (which produced a cooling), Murri injected fœtid pus under the skin; whereupon, he affirms, the temperature rose quite as much as after injection of the same in animals not operated on. But these experiments, as detailed in the original Italian publication, have been carefully examined by Handfield Jones, and he considers the results do not warrant the statement made. "Though some elevation of temperature followed the injection of pus," says the latter able physician, "yet it never reached fever-height in rectum or skin, and soon fell again considerably." And, in reference to another experiment, "it is clear that the pyrogenic effect of the pus did not avail to bring up the temperature to the normal, and consequently the result was not such as in animals with sound cords." Three years and more have elapsed, and one has heard of no repitition of these experiments or other evidence confirmatory of Murri's statement. On the contrary, Samuel's experiments prove, as we have seen, that alike the febrile heat and the normal heat are dependent upon the musculature, and that when this is paralysed, as in section of the cervical cord, the heat of the body is dependent upon that of the surrounding medium. Moreover, the fact remains that no one yet has ever succeeded in producing fever in cold-blooded animals, to whose thermal condition the warm-blooded one is reduced by section of its cervical cord.

Very interesting are the recent observations of Volkmann and Genzmer on the asceptic wound-fever. Its apparent independence of all external infection (as in the case of subcutaneous injuries), the presence of high temperature (even to 40 deg. C.—104 deg. F.) with absence of the ordinary symptoms of disorder, and its harmless course and issue, are remarkable peculiarities. The observers themselves attribute it to absorption of matters nearly allied to the physiological products of retrogade tissue-metamorphosis, instead of to heterologous matters, as in septic fever—an explanation quite in accordance with Samuel's views, but admitted by them to be provisional only. We have yet to learn more about aseptic fever. In reference, however, to the tolerance of high temperature, I must confess myself to be one of those who hold to the doctrine of Liebermeister, that unremitting high temperature constitutes the chief element of danger of fevers generally. While he was the first to insist on this point, practical medicine is not less indebted to him for introducing the antipyretic treatment by which this danger may be in great measure controlled.

A word upon hyperpyrexia. This, as we know, mostly occurs in the course of acute rheumatism or rheumatic fever, and it has long been my conviction that in a majority of the cases the same is due to mismanagment. What determines the remarkable activity of the sweat-glands observed in this disease is not yet ascertained; but a very little consideration suffices to show that in any given case, except for this copious perspiration, the temperature would at once be higher; it is just so much natural heat-discharge; and the true indication would be to promote it and assist cutaneous transpiration. But how often is just an opposite course followed! The patient from an exaggerated dread of chill and the painfulness of all movement, is allowed to remain for days together under an impervious load of blankets and counterpane, enveloped perhaps in flannel, his skin uncleansed, reeking in his own exhalations, and with, by-an-by, a copious miliary eruption testifying to the folly perpetrated. Without ignoring individual susceptibilities, I believe it is under these circumstances that rheumatic hyperpyrexia is most prone to arise. A case of my own, some years ago, in which the employment of warm baths (not cold) obviously contributed to recovery, first suggested to me this view, and further experience has only served to confirm it.

It has been said recently by one of our leading men, that all we know of the pathology of fever can be set down on a single page of octavo; and certainly the literature of the subject in our language is, with one or two exceptions, a blank. Yet, what is fever? Is it not the most common morbid condition of the organism? And, again, though it may sometimes be only a trivial disorder, is it not very apt to be as formidable as any we have to deal with, carrying off its victims from all classes of society? We can hardly congratulate ourselves upon this state of things. But lest any should reproach on the one hand, or despair on the other, we may, in conclusion, just look for a moment at the difficulties attending investigations into the nature of the febrile process, and then at what should be encouragment to the same. Under the former head, as we are painfully aware, we have no State aid, but rather the contrary. The method of proceeding, then, being comparison—comparison of the febrile state with that of health—in order that reliable results may be obtained, it is clear that all conditions and circumstances should be similar in the two cases, fever alone excepted. The healthy person should be, like the fever patient, confined to bed, with an equal quantity of clothes, and upon the same fever diet; he should be of equal body weight; further, he should be, in the language of physiologists, in a state of nutritive equilibrium, or brought thereto at the commencement of the period of observation; that is to say, his tissues should be neither growing or wasting; either there must be no therapeutical treatment at all for the time being, or it must be carried out alike in both cases. Failing any one of these particulars, a normal standard of comparison is wanting. Recourse for the purpose to non-febrile invalids, hospital patients, the subjects of chronic disease, is but a poor alternative. More satisfactory, in some respects, have been observations made upon patients suffering from intermittent fever, who could then be compared with themselves in the pyrexial and in the apyrexial periods. Observations upon patients under the influence of antipyretics, a new method, we have already had occasion to notice. As to researches carried on in certain of the lower animals in whom fever is artificially produced, of course the deductions are founded upon analogy. But I have wearied you.

Regarding the *encouragement* to these investigations, I think if we could only realise what it would be to have an effectual control over the febrile process, based, as such effectual control ever must be based, on a thorough knowledge of its pathology, we should want no more. The prospect of such a large accession to the powers of our art should suffice.

"In order that the medical treatment of the febrile process should be perfect," writes John Simon, "the process ought to be thoroughly understood in respect of all the dynamics of its constitution; so thoroughly, indeed, that the bedside practitioner shall be able to apply his counteragents with the precision of one who conducts a merely physical experiment." This is an ideal which, far from the doctrine of despair that

fever is essentially beyond our control, and that we must be passive in its presence, is worthy to engage our highest powers and best energies in its pursuit ; is worthy of those commissioned to "heal the sick," and in the service of Him by whose Divine fiat ἀφῆκεν αὐτὴν ὁ πυρετός. ;

Clinical Records.

CASES OF EAR DISEASE.

By GEORGE P. FIELD,
Aural Surgeon to St. Mary's Hospital.

Mr. B., a gentleman living in the country, completely deaf from childhood in the left ear, and lately suffering from slight deafness in the right, was recommended by his medical attendant to blow air forcibly, by Valsalva's method, into his ear. On one occasion, as he was unable to get any air through the Eustachian tube, he went on blowing until suddenly the air rushed through the tube with great force, causing acute pain in the right ear and leaving him very deaf. The noise in his ear at the same time became so loud and distressing that he talked about committing suicide. He came to London to try and get relief, and was sent to see me by Mr. Tapson. I found him to be in a highly nervous state ; he said the tremendous roaring in his right ear prevented sleep, and he was so exceedingly deaf that it was necessary, to carry on conversation, to write down on paper what was said to him. I considered that the force used had caused very considerable congestion of the blood vessels, with perhaps slight effusion into the internal ear. When I saw him the membrana tympani still looked red, but all pain had ceased. He was leeched freely and blisters were applied behind the ear, and purgative medicines were ordered. The effect of this treatment (*a*) was highly satisfactory, as he in a short time regained his hearing and almost completely got rid of the noise in his ear.

K. P., æt 2, deaf and dumb, was brought to see me at the hospital, March 1878. Her father, who brought her stated that the eldest of his six children was born perfectly healthy, but the mother, four or five months before the second child was born, met with severe fright from the house being on fire. The five children that were born subsequently are all deaf and dumb ; the father did not marry a near relative, and both parents are in good health. Most of the children were brought to see me, but they were all incurable.

Mr. C., æt. 25, came to me, giving the following history of his case : Severe attack of scarlet fever eighteen years ago, followed by considerable deafness of the right ear, from which there had been a very offensive discharge going on constantly ever since. He could hear my watch only when within half an inch from the deaf ear ; the purulent matter was making its way through a large perforation in the membrana tympani, thereby setting up inflammatory action and causing very great pain. The pain entirely left him after the application of a few leeches, and I then prescribed weak lotions of carbolic acid and acetate of lead, to be used frequently, the strength being gradually and carefully increased. I also ordered a mixture containing iodide of potassium and nux vomica, under which treatment he gradually improved until he could hear my watch at the distance of eighteen inches, and the discharge, of which he complained so bitterly on account of its offensiveness, both to himself and friends, entirely ceased.

A. E. A., æt. 3, was brought to the hospital, Feb., 1878, totally deaf in both ears. Her mother stated that a year ago the child had had a severe attack of scarlet fever, with great discharge from both ears, and that four or five "little bones" came away from her ears.

I have seen three exactly similar cases during the last year, in which the ossicles have come away in like manner, and I cannot help thinking that in most of them, if more energetic local measures had been promptly adopted, total deafness at any rate might have been avoided. Paracentesis of the membrana tympani is, in some of these cases, most useful ; and Roosa recommends that a cataract-needle should be passed through the posterior membrane, in any case, whether bulging was seen or not, when the use of leeches did not markedly diminish the pain within a few hours.

J. B., æt. 38, a labourer, came to the hospital, April, 1878, suffering from intense pain on the left side of the head. He stated that he had been almost completely deaf in both ears since he had had a fall six years ago, and that for the last three months he had been under treatment for the intense pain in the head, which was attributed to neuralgia. At the end of April he came to St. Mary's, and was seen by one of the physicians for the out-patients, who at once discovering ear mischief sent him to me. I found a large polypus blocking up the external meatus ; I removed it, and immediately a large quantity of thick fœtid pus was released and escaped from the ear.

He at once obtained relief ; his hearing afterwards slightly improved ; the pent-up pus had no doubt given rise to the severe head symptoms, and probably would have led to much more serious results if evacution of the discharge had not taken place.

Miss Q., æt. 22, of Bury St. Edmunds, came to consult me, Oct., 1877, for deafness in her left ear. She said that she had been slightly deaf for several years, but for the last two months she had almost entirely lost her hearing. She stated that her mother and a sister were both deaf in the left ear. I removed a large plug of crumen, and she heard perfectly well. Her sister, aged 18, afterwards came to see me. She could not hear the watch in contact in her left ear, and she remarked that she never remembered having heard a sound of any kind on that side. After some slight difficulty I removed an immense lump of black-looking wax, and her hearing was likewise restored.

Remarks.—The two first are uncommon cases of considerable interest.

The third is an instance of long-standing otorrhœa with its attendant miseries, and is typical of a vast number of persons who year after year go unrelieved, simply because all rational treatment is neglected from a popular idea that discharges from the ear, however offensive, should be left alone. Is it to be wondered at that a third of all cases of abscess of the brain are due to chronic suppuration from the ear ? (*a*)

The fourth marks the ravages of scarlet fever, and points to the advantages of an early incision through the membrana tympani.

The fifth is not at all an uncommon instance of error in diagnosis. The patient assured me that for three months he had been treated for violent headache and neuralgia, and in the hope of getting relief had spent all his savings, till at length he was compelled from want of funds to seek relief at an hospital. The polypus was somewhat deeply seated in the external meatus and so had escaped notice.

Were it not for the apparent ignorance of the bulk of the profession of the rudiments of aural surgery, I should not think of publishing such a case as the sixth (or of many of the others), but while so much and yet so easily remediable suffering exists, surely it becomes a duty to try and disseminate the simple truths necessary to relieve it.

Minnie Warren, the well-known dwarf, who has delighted so many audiences, died at Fall River, in America, on July 30th. in childbirth.

Special Reports.

THE PROPHYLAXIS OF INFECTIOUS AND CONTAGIOUS DISEASE.

ABSTRACT OF A REPORT ON THE TRANSMISSIBLE DISEASES, WHICH REQUIRE ISOLATION, EITHER IN GENERAL OR SPECIAL HOSPITALS, AND ON THE MEANS OF RECONCILING THIS ISOLATION WITH THE CONDITIONS AND REQUIREMENTS OF HOSPITAL ADMINISTRATION.

Made in the name of a Commission composed of

MM. FAUVEL, LEGOUEST, LEON COLIN, LE ROY DE MERICOURT, MARIE DAVY, MICHEL MORING, PINARD, ROCHARD, TARNIER, VALLIN, VIDAL, VIOLET LE DUC,

By MM. FAUVEL, AND VALLIN.

(*Continued from page* 123.)

I.—ON THE METHODS OF ISOLATION IN GENERAL.

1. *Individual Isolation.*—Isolation may be either individual or collective. Individual isolation is surrounded with enormous practical difficulties. We shall briefly enumerate some circumstances in which it may be required :—

1. In such grave and transmissible affections as diphtheria in the adult, glanders, rabies, and charbon.

2. When a patient has two transmittable affections, as scarlatina and diphtheria.

3. When the diagnosis is uncertain. We shall have, subsequently, to speak of observation-wards.

4. In cases of surgical septicæmia, purulent infection, traumatic erysipelas, and hospital gangrene.

5. On the principle of individual isolation the new system of maternities is based.

But it is necessary that this isolation should not be illusory, as it so often is. The small rooms joined to large wards and opening on a common corridor are useful under certain conditions, as when violent delirium, alvine incontinence, &c., occur in the course of some disease, but such isolation is imperfect.

In connection with all hospitals, there should be one or two pavilions on the cell system, with two or four chambers.

Architects should bear this in mind. The construction of these chambers should be of such a nature that they can be easily flushed with water and disinfected by some chemical agent on the removal of each patient.

2. *Collective Isolation.*—This form is much easier of application, and, with certain precautions, affords a sufficient security for the patients themselves, for their neighbours, and the attendants. There are objections raised against the system which we must consider.

A.—*Has collective isolation any danger for the patients themselves?*—We may take petechial typhus and variola as two different types of diseases, the concentration of which, at one point, might be dreaded.

As regards petechial typhus, Murchison (*a*) has devoted one chapter of his work to prove the innocuity of this reunion of patients in special wards.

As regards variola, Dr. E. Vidal has shown in his excellent report of 1864 that the fears of those who opposed concentration were not justified by experience.

From 1815 to 1825 all patients suffering from variola were treated in the hospital of La Pitié and placed in a separate quarter ; in spite of the bad hygienic conditions of this hospital, Serres did not remark any aggravation of the affection from this concentration of patients. The deaths were very few.

But it is impossible to find a more conclusive example than the one furnished by M. L. Colin, (*b*) Chief Physician of the Hospital of Bicêtre, which was exclusively devoted to small-pox in 1870-71

The same results have been noticed by Isambert (*c*) at St. Antoine, and by M. Brouardel (*d*) at the Hospital of La Charité-Annexe. The small-pox mortality of these two hospitals varied from 18 to 20 per cent., a proportion which we find at all times and in all countries in civil hospitals.

(*a*) Murchison. "Continued Fevers." Chap. viii., p. 689.
(*b*) L. Colin. "Variola from an Epidemiological and Prophylactic Point of View." Paris, 1873. P. 113.
(*c*) Isambert. "Bul. Hospital Medical Society." 1870. P. 306.
(*d*) Brouardel. "Bul. Hospital Medical Society." 1870. P. 315.

The following figures are taken from the annual reports of the metropolitan asylums :—

Stockwell Small-pox Hospital, London.

	Number of cases admitted.	Mortality.
1871	2,288	18·6
1872	601	18·9
1873	64	18·9
1874	59	8·6

We may, then, conclude that the concentration of a large number of patients in one ward suffering from typhus or from small-pox does not increase the mortality or the gravity of the disease.

It may be the same for measles, scarlatina, and diphtheria, but epidemics of these diseases are so variable that it is difficult to demonstrate this point.

This innocuity ceases as soon as we have overcrowding, and the accumulation of too great a number of patients in one ward, and hence we see such complications as erysipelas, abscess, &c.

In some epidemics hospital resources become insufficient, and supplementary beds accumulate in special hospitals. What is really due to banal hospital influences, is too often imputed to the concentration of the virus, or to increase of the toxic properties.

B.—*Is Collective Isolation a Source of Danger to a Neighbourhood?*

It is alleged that collective isolation may become a source of danger by forming as it were a centre from which the epidemic may spread into the neighbouring streets or houses. We may here again take typhus and variola as an illustration.

At London and Glasgow there are fever hospitals, but they have never become a point of departure or origin of an epidemic in a neighbourhood. The London Small-pox Hospital, which has received 6,000 patients from 1835 to 1851, has never propagated small-pox in Highgate.

Isambert in 1870, has established the same immunity in the neighbourhood of the Hospital St. Antoine.

At one period the two London Fever Hospitals were filled with scarlatina patients, but the neighbourhood did not suffer in consequence.

During the last few years some instances have been adduced on the other side. In 1869 M. Moutard Martin noticed the relative frequency of cases of small-pox in the houses near the Hospital Beaujon.

In 1870 small-pox became common in the *Quatier de Notre Dame des Champs*, near the Hospital of the Incurables, which had been transformed into a temporary small-pox hospital. The inhabitants of that quarter complained, and attributed the propagation to the hospital.

A report of the Committee of Hygiene, 1870, was negative on the fact of its propagation. Another report of the Council of Hygiene, 1870, admitted the reality of this influence, but the reporter, M. Delpech, made some reserves, and admitted that the exceptional mortality in the neighbourhood of the Incurables was only remarked when the hospital was crowded with patients. (*a*)

During the epidemic at Pavia in 1871 the two hospitals Il Gallo and La Rotonda were used. It was remarked that small-pox was much more intense near these two hospitals, and in particular near the Rotonda. (*b*)

At London 15 patients died of small-pox in the neighbourhood of—from 500 to 1,600 metres—the Hampstead Small-pox Hospital.

An injunction has been demanded against this hospital, and the case is pending in the Court of Queen's Bench. These facts may be real, but they have not the signification assigned to them. They may be explained by the too easy communication of the infirmarians with the exterior ; by the visits of the parents or friends of the patients living in the neighbourhood of the hospital, and sometimes even, as in a case quoted, by giving the hospital-linen to a washerwoman in the neighbourhood.

The hospital of Bicêtre furnishes some important evidence on the propagation of the disease ; one of the pavilions was occupied by the *etat-major* of a military division ; each day numerous soldiers passed through the hospital on various duties. Small-pox raged in the regiments camped around the hospital;

(*a*) Report 180. "Official Journal," December 5th.
(*b*) J. Rendon. "On the Isolation of Small-Pox Patients at Home and Abroad." *Gaz. Hebdom.*, 3rd May, 1878.

but the fort Bicêtre, nearest the hospital escaped, because the marines had not occasion to enter the hospital.

If we collect together in one ward a large number of cases of small-pox, scarlatina, cholera; if communication with this ward is easy; if the *personnel* and materiel are common, it is probable that the contagion will extend. But we should conclude, not that concentration is dangerous, but that isolation does not exist.

Everything proves that the diffusion of the germs, especially of eruptive fever, is difficult, and that a distance of 15 to 20 metres is sufficient guard, provided that the line is not broken by persons or things.

C.—*Influence on the personnel of the Hospital.*—It cannot be disputed that an individual apt to contract typhus, variola, or scarlatina, will be attacked, in an hospital devoted exclusively to these fevers, more surely and promptly than in one containing only one or two patients; but this is not the question. Most of the affections we are considering have the privilege, that a first attack confers immunity. It is easy then to select infirmarians with this acquired immunity, and this condition is so common that the staff can be maintained.

F. Jacquot, during the war in the East, decreased the mortality of infirmarians by employing soldiers who had typhus in the preceding year. At the London fever hospital, cases of transmission were not numerous, 1 to 100, rarer than in the general hospitals, 13 to 100.

In conclusion, collective isolation, practised under proper conditions, does not seem to be a source of danger, either to the patients, neighbours, or attendants. It is desirable that testimony from various independent sources should confirm this.

All transmissible affections should be removed from general wards. In certain grave and contagious affections we require still more; isolation in the interior of general hospitals it is only a half-measure.

We shall next examine, by the aid of the experience acquired in other countries, the advantages, inconveniences, and methods of isolation adopted.

(*To be continued.*)

WEDNESDAY, AUGUST 21, 1878.

THE ADDRESS IN SURGERY—BRITISH MEDICAL ASSOCIATION.

THIS time last year it was our pleasing task to comment upon the address which Mr. Spencer Wells delivered at the last annual meeting of the Association. With equal pleasure we proceed to notice the address of Mr. Wheelhouse, the delivery and subject matter of which distinguished it from all the other addresses that were delivered at the meeting at Bath. Now, as then, a very gratifying review was taken of the great progress surgery has made within the last quarter of a century; but whereas Mr. Wells confined his remarks to the more prominent features of this progress, and, as might have been expected, to that special operation which he had himself done so much to perfect, Mr. Wheelhouse took a more extended view of surgical advancement—from the removal of a nævus to the operation of gastrotomy, from the application of a ligature to the reunion and restoration of divided nerves.

Mr. Wheelhouse first acknowledged the great advantages in many cases of the "bloodless surgery," introduced by Prof. Esmarch, of Kiel; and he cited a case in which that method of operating saved the life of a little child whose leg had to be amputated at the hip-joint; but who was in such an exhausted and emaciated a state that the loss of two or three ounces of blood would have proved fatal. The "battle of the ligatures," and "antiseptic surgery," next claimed his attention. With regard to ligatures, he believed that the rule laid down by Jones, as long ago as 1805, and afterwards affirmed by the late Mr. Hodgson, was as true now as it was then—viz., that the only safe way of securing an artery is fairly to divide its inner and middle coats, and that the only ligature to be trusted to do this efficiently, is a well-made firmly twisted round cord of silk. Of the antiseptic method of operating, Mr. Wheelhouse is a strong supporter. It has been recently asked whether in adopting this antiseptic principle, we "may not possibly be encouraging a great delusion." "As a practical surgeon," says Mr. Wheelhouse, "I emphatically answer 'No,' it is not a delusion but a truth of the greatest value; and I can call to my mind, many cases in which, except for this 'delusion,' my patients would have lost their limbs, and oftentimes their lives also." Nor did the orator forget to acknowledge the great gain to surgery which has resulted from surgeons securing, wherever it is possible, that physiological rest on which Mr. Hilton long ago insisted in his admirable lectures on "Physiological Rest and Pain." The treatment of "irritable bladder," from stricture, by freely dilating the urethra, as practised by Sir Henry Thompson, and other surgeons, was a recent application of this principle; while Mr. Wheelhouse and his colleagues, in order to carry the principle to its logical conclusion have, in several cases of severe ulceration of the bladder, gone so far as to operate as if for lithotomy, with the view of procuring absolute quietude for the time, and they have met with encouraging success.

At the meeting of the Association at Manchester last year, Dr. Sayre, of New York, demonstrated to the profession his new and successful method of dealing with curvatures of the spine. We need not tell the reader that this method has received the entire approval of the profession; and now, we find Mr. Wheelhouse adding his testimony to the great value of Dr. Sayre's method. "When I think," he says, "of the many cumbrous and expensive contrivances which, for years past, I have seen in

use in the treatment of such cases, I feel inclined to blush for the skill which had failed so long to seize and act upon an idea so simple, and at the same time so perfect." The great acquisition, both to medicine and surgery, of Dieulafoy's aspirator, is next spoken of in equal terms of praise, and he noticed how by its use, an empyema, a fatal effusion into the pericardium, a bladder distended almost to bursting, a dropsical knee-joint, and even a pyæmic abscess in the centre of the lung, are placed as easily under control as the ascitic abdomen was in former days. "Indeed," said the Orator, "there seems to me to be no organ in which suppuration has occurred, or within whose investing membranes the normal secretions have become superabundant, that may not be dealt with by this useful instrument.' And while the question is asked: Is it too much to hope that the time may come when we may be able to empty an offensive vomica, and wash it out with some innocuous antiseptic fluid! It is being satisfactorily answered, for Mr. Wheelhouse was writing the above passage, such an operation was twice successfully performed,—once in London by Mr. Erichsen, for a patient under the care of Dr. Theodore Williams, and once in Leeds by Mr. Jessop, at the suggestion of Dr. Clifford Allbutt.

But of all the triumphs of modern surgery, none can be compared in magnitude or importance with those obtained in the region of the abdomen. When we remember the number of years that have, by the operation of ovariotomy alone, been added to the sum of human life, and call to mind the fact that by the hands of two operators alone, Mr. Wells and Dr. Keith, the lives of more than 1,000 women have been rescued from death, to say nothing of the results of the operation in other hands, surgeons have, said Mr. Wheelhouse, as much reason to be proud of their work as any class of men in the world. Even surgical relief in cases of intestinal obstruction is far more frequently and successfully resorted to now than it was a few years back, so that surgeons are beginning to question the propriety of permitting anyone to die from obstructive intestinal mischief without first ascertaining whether the patient cannot be saved by this means. Then there is the operation of lithotrity, which, in the adult, bids fair to supersede the operation of lithotomy. The experience of Mr. Wheelhouse leads him to hope that the time will come when, under the improved methods of diagnosis now at hand, no stone will be allowed to remain so long in the bladder as to pass beyond the reach of the lithotrite, and that, except in the case of children, lithotomy will have become one of the operations of the past.

There are many other points of interest in this Address to which we might have called attention, such as the remarks that were made in reference to the modern treatment of dislocations, the use of the drainage tube in chronic suppuration of the kidney, the successful extirpation of that organ, &c., but we must hasten to draw this notice to a close. Before doing so, however, we must not pass over a triumph in surgical art which Mr. Wheelhouse himself has very recently achieved, and by which a completely paralysed and useless limb was so restored to health as to enable the patient to return to his work. A severe cut with a scythe had completely divided the sciatic nerve, and led to a paralysis of the limb, in the treatment of which all ordinary measures proved perfectly powerless. An attempt was then made to re-unite the ends of the divided nerve. After these ends had been exposed by careful dissection, and had been pared obliquely until apparently fresh nerve tissue was exposed, they were, although much separated by the shortening or shrinking of the nerve, brought together by fully flexing the knee. They were then carefully stitched together with very fine carbolised catgut thread; the wound was closed, the ankle was firmly lashed to the buttock, and in this position the patient was put to bed. Gradually sensation was found to be returning in the limb. At the end of five weeks Mr. Wheelhouse began to relax the position of the leg, and to let it down inch by inch until it became straight again. By slow degrees the power of voluntary motion also returned, and on August 7th (three months after his admission to the hospital) he was discharged so far cured that, with the help of two sticks, he was able to walk about. From that time to this he has gone on improving, and during the whole of the past winter he has worked in the fields as he was wont to do before his accident.

But even the interesting and comprehensive retrospect which Mr. Wheelhouse has taken of modern surgery is far from embracing all the improvements which have recently taken place in this department of medicine, and could we but picture to ourselves all the improvements and discoveries that have been made in practical surgery compared with the practice of our forefathers two centuries ago, we should be struck with the marvellous progress that this science has recently made. Towards the end of the 16th century a celebrated Frenchman was afflicted with that painful disease which it is now the pride of modern surgery to cure, namely, the stone. In the medicine of his time, however, Montaigne had no faith. "I submit myself," he said, "to Nature, confident that she is armed with claws and teeth to defend us against the assaults of maladies," and he would even, with bitter sarcasm, remark that "he could excuse the medical profession for living by the folly of mankind when he reflected that it was not the only proof of the weakness of the age." How different would his opinion have been had medical art been, in his day, as perfect as it is now!

Lastly, nothing can better show the progress that modern surgery is making than the manner in which it is encroaching upon the domain of practical medicine. Diseases with which surgical interference would, years ago, have been thought the height of folly and temerity, but the fatality of which could not be denied, are now robbed of their terrors, or completely cured by the aid of that art which was formerly contemned. Now there is scarcely a part of the body, or a disease, which is sacred to the knife or exploring trocar of the surgeon, and over and over again the surgeon rescues from imminent death patients to whom the physician can no longer hold out any hope. Nevertheless, a comparison of the relative achievements of modern surgery and modern medicine need not create any feeling of envy or jealousy on the part of the physician, for are not both physician and surgeon striving to arrive at the same goal, and are not surgery and medicine twin

offspring of one parent Art, whose beneficent object is to prolong the life and relieve the physical sufferings of mankind?

SANITARY DISORGANISATION IN DUBLIN.

We have been so frequently obliged to submit the Public Health Committee of the Dublin Town Council to criticism, that it is unnecessary now to remind our readers of the sins of sanitary commission and omission of which that conclave has been guilty. The utter laziness, carelessness, and incapacity formerly displayed by the Committee, may be passed over for the present, inasmuch as that body has completely collapsed and has deliberately abandoned its control of sanitary affairs in Dublin, making not even a pretence of dealing with the public health of the City. How this state of affairs has come about is worth narrating, because it illustrates more forcibly than anything we could say, how hopelessly, impracticable, and incorrigible the sanitary tribunal of "the second city in the empire" has come to be. The Dublin Corporation, as every citizen knows, has been spending money in the most lavish way, for while its administration has been continuously mean and niggardly in respect of such expenditure as would be directly beneficial to the citizens; while it has been unable to find funds for cleaning the streets, to keep the sewers in order, to purify the Liffey, to provide for the housing of the poor, or even to mend the pathways, it has always had a thousand or two for a pic-nic to London, a law contest in Parliament, or a superannuation job for an ex-official whose "cronies" are sufficiently influential to carry a pension vote in his favour. This has gone on for a long time, and the cash has been always forthcoming by a financial shuffle by which one fund borrowed from another, and paid back the loan in such a way that the transaction was not noticeable in the accounts.

Within the past year, however, Mr. John McEvoy (a gentleman of remarkable financial ability, who has already rendered to his fellow citizens the most valuable services), observed that, in order to cover a heavy deficit arising from these extravagancies, the Corporation has levied a borough rate, which they had no earthly right or power to demand, and as it appeared to him that there was not the least intention on the part of the Corporation to abstain for the future from the practices which had run them into debt, he thought it right to put a short stop to the corporate proceedings. Accordingly, he applied to the Court of Queen's Bench for a *certiorari* to quash the rate, and at once an injunction was issued restraining the Corporation from collecting the money.

This story is necessary to our theme, because the Public Health Committee has, hitherto, derived its funds from the borough rate. At the moment when the rate was quashed an epidemic of small-pox existed in Dublin. With an alertness which savoured of hearty satisfaction at being able to get rid of sanitary responsibility, and at the same moment to punish the citizens for Mr. McEvoy's contumacy, the Public Health Committee decided to abandon Dublin to its own miasms, and to leave the sick poor to find their own way out of the small-pox. They at once decided to sell the hospital cab, to cease payments for destroyed infected clothing, to shut up the disinfecting chamber, and to dismiss all the sanitary officers; in fact, to abandon the whole sanitary organisation, and thus the matter now stands.

We have to observe, in the first place, that there is no good ground for supposing that the Public Health Committee is dependent upon the borough rate, and there is, therefore, no good reason why they should cease their functions when that rate has been withdrawn.

We have to remark, secondly, that this determination is a spiteful attempt of the Corporation to punish the citizens for troubling them with complaints as to corporate extravagance. The Town Council has made not the least move towards reducing the expenditure on matters from which no one but corporators, their officers, and their friends derive any benefit; but it has hastened to retrench in the items in which the outlay is most beneficial to the city, nay, absolutely indispensable to the sick poor. On this subject the *Dublin Builder* says:—

"No one will object to see the Corporation, although acting under compulsion and against its will, retrenching its expenses; but while doing a compulsory duty, the Municipal Council aims at committing a public wrong. It hopes and endeavours to alarm the citizens by pleading insufficiency of funds to carry out its sanitary duties, and tries to throw upon others the consequences that may result from leaving sanitary work undone. If bankruptcy stares a merchant in the face, he begins at once, if he is an honest man, to cut down his household expenses, so far as these relate to luxuries or things that may be dispensed with until better times return. If he has too many servants he reduces their number or the salaries. He will not, on the other hand, if illness, small-pox, fever, or other diseases are in his house, and his wife or children stricken down, neglect to send for the doctor or procure for them the needed medical attendance their cases may require. It is clear to everyone that knows aught about the various offices, appointments, salaries, &c., of the Corporation, that a great reform and a great retrenchment of expenses could take place, apart altogether from any consideration of the alleged difficulties appertaining to the quashing of the new borough rate."

The Executive Committee of the Dublin Sanitary Asscciation also adopted the following resolution:—

"That this committee are of opinion that retrenchment should, in the first place, be effected in all other departments whose expenses are defrayed out of the said borough fund, and that during the epidemic of small-pox, there should be no interruption of the sanitary measures at present being carried out in the city."

We cannot contemplate with as much ease of mind as the Corporation does, the prospect of an increase in the small-pox epidemic, or an outbreak of dirt fevers, resulting from neglect of sanitation; but there is some satisfaction in the consideration that if such a misfortune should occur, it might quite possibly result in the Corporation being turned out "bag and baggage" by the Local Government Board, and an administrative commission appointed in its place. Such a step the Government will certainly not take except in the last necessity, and in exasperation against the members of the Town Council; but the step has been threatened on a former occasion, and any proceedings of that body which bring us nearer to their extinction or their root and branch, reform cannot be regarded without a sense of pleasurable hope.

Notes on Current Topics.

The Sanitary State of Leicester.

THE reports presented by the Medical Officers of Health, the one for the past quarter and the other for the half-year ending the 30th of June, showed a state of things highly satisfactory—the death-rate being below the eighteen large towns reported upon by the Registrar-General. This the medical officers attribute very largely to the course pursued by the Sanitary Committee in securing an efficient inspection of the town, and ordering the abatement and removal of nuisances. This state of things is the more remarkable when the position of the town, the nature of the subsoil, and the admittedly imperfect drainage is taken into account. The aim of the Sanitary Committee has been to rid the town of all "filth-produced" or zymotic diseases, and the measure of success which has attended their labours may well encourage the committee to persevere in the same direction. By frequent examination of the drinking water, attention to defective surface drains, filling up thousands of abominable cesspools with which the back yards of the town were honeycombed, the air, water, and general surroundings of the dwellings of the inhabitants have been purified, and the diminution in the death-rate, betokening an improvement in the general health, has been the result.

In making the above remarks, the *Midland Free Press* says that it is not oblivious to the exceptionally high death-rate in that town from infantile diarrhœa during the month of July, but it takes exception to the severe strictures which one of our contemporaries has made upon the authorities of Leicester for the neglect of sanitary reforms. "Only in one direction (says the *Midland Free Press*) can it be said that Leicester has 'lagged behind' any other town in sanitary measures, and that is in relation to the enlargement of its sewers and the provision of an outfall. Owing to the rapid increase of the town the sewers have become inadequate to fulfil the work required of them, and the physical position of the town, lying as it does in a valley, adds to the difficulty of cleansing them, as no free outfall can be easily obtained. To meet this difficulty a scheme has been propounded the cost of which is roughly put at a quarter of a million sterling, but which if carried out has been considered by some as of doubtful efficacy. With such a project, involving such an immense outlay of public money, it need hardly be wondered at that the authorities should be chary at entering upon the scheme until they are fully assured of its practicability." Nevertheless, the criticism of which the Leicester authorities complain is somewhat justified by the investigation which Dr. William Johnston, the medical officer of health for that town, made last year into the causes of the great infantile mortality from summer diarrhœa. It will be remembered that in 1875 a Government Sanitary Committee made inquiry into the subject, the result of which was that they attributed the cause of the disease to "heat in conjunction with a waterlogged soil." But Dr. Johnston, in an able and laborious report, which we noticed in May, quite discredited this theory, and came to the conclusion that the summer diarrhœa of Leicester "is dependent upon the pollution of the air by the escape of sewage gas from the hastily devised, badly constructed, non-ventilated system of sewers."

We will, however, admit that there may have been other causes in operation as influential—or even more influential than the defective state of the drainage. As we pointed out on a former occasion, it seems strange that a diarrhœa of a specific nature should (as was shown to be the fact) in a large majority of the cases have been confined to infants under twelve months; infants, half of whom could not have been exposed to the disease through drinking impure water—whose parents were living in premises the sanitary condition of which is said to have been pretty good—half of whom were brought up by hand, improperly fed, and doubtless subject to other conditions which, when combined with the prevalence of very hot weather, might, independently of breathing air or drinking water contaminated with sewage exhalations, quite account for so many of them being carried off with diarrhœa.

At all events, it is satisfactory to find that the authorities at Leicester are anxious to redeem the character which that town has had for its unhealthiness, and no doubt it will not be long before they have removed the only remaining blot upon their sanitary arrangements.

Poisoning by Arsenic in Food.

MR. CARTTAR, West Kent coroner, opened an inquest at the Royal Albert, Manor Road, on the body of Frederick Arthur, aged eleven months, son of Charles Nevill, of 77 Manor Road, blacksmith, who died at half-past seven, p.m., on the 9th. Rose Hoskins made a rice pudding for her husband, a portion of which she gave to the deceased and another child aged four years, deceased's mother being present. Five minutes afterwards the eldest child began to vomit, and in order to attend to it the mother placed deceased in a cot or cradle, but before she could see to the other child the deceased began to vomit. The mother and lodger became alarmed and sent for four or five neighbours, who each tasted the rice pudding, feeling a burning in the throat followed by vomiting. A doctor was sent for who found the deceased under the effects of poisoning, and he took possession of the remainder of the pudding, rice, condensed milk, and ground nutmeg of which it was made. The deceased continued very bad and died the next day, and the other child is not out of danger. The coroner tasted some powder produced, a portion of which had been used in the pudding, and was of opinion that it was only ground nutmeg. In order that the ingredients might be examined to trace the poison, the inquiry was adjourned.

Small-pox from Ireland.

AT a meeting of the West Derby (Liverpool) Guardians the chairman called attention to the fact that small-pox had been imported into the workhouse by the arrival of families from Dublin, where the disease is epidemic. The sufferers came by steamer, but were subject to no quarantine examination as they would be if they came from a foreign port where disease prevailed. He thought it was very hard that Liverpool should suffer in this way. The chairman's remarks were endorsed by the board, and it was resolved to direct the attention of the port medical officer of health to the matter.

The Study of Medical Botany.

In the *Daily Telegraph* for the 17th inst. attention is drawn to the satisfactory and progressive prosperity of the Royal Botanic Society. In no department, observes our contemporary, was the growing utility of the Society so marked as in the increase of students' admission orders and the number of specimens distributed for purposes of scientific study, the former having increased from two hundred and thirty in 1871 to four hundred and eighty, and the latter from forty thousand last year to sixty thousand in this.

It is to be regretted that botany is not more seriously cultivated by the medical, as well as by the general student, especially as medicine is so much indebted to the vegetable kingdom for many useful drugs. Some idea of the number, the value, and even the beauty of our medical plants may be formed by a glance at the admirable illustrated description of these plants which has been given to the profession by Messrs. Bentley and Trimen. Were the medical student only acquainted with the botanical characters and uses of one-half the plants there described, and most of which he can see in the gardens of the Botanic Society, of the Apothecaries' Hall, or at Kew, he would not regret the short time he had spent in the acquisition of that minimum amount of knowledge. As a rule, however, he gives little or no attention to the subject, and it is almost ignored by some of the examining boards. The fact, too, that the study of the natural orders of plants is of great value in the mental training of the medical student, is almost entirely overlooked, so that even our lecturers on Botany, who, one would think, should make their lectures as popular as possible, give the greater part of their course to the consideration of the morphology and physiology of plants, much of which could be as well studied at home, and only leave a few lectures for the demonstration of the characteristics of the various natural orders and species. This is a great mistake, for by learning to distinguish one plant from another, or to recognise the natural order to which any given plant belongs, the student's mind will be all the better prepared to seize and appreciate those various symptoms by which one disease is distinguished from another. Hence the devotion of a little time and study to the diagnosis of the different classes, and orders, and genera, into which plants have been divided, is about the best intellectual training he can have preparatory to his study of medical diagnosis.

Royal College of Surgeons of England.

From the annual report which has just been published by the Council of the College, and about to be presented to the members, it appears that of the receipts and expenditure from Midsummer-day, 1877, to Midsummer-day last, the former amounted to £15,486 9s. 5d., derived principally from fees paid on admission to the fellowship and membership—viz., £12,028 5s.; rent of chambers adjoining the College and dividends on stock, £2,550 15s. 10d. The expenditure amounted to £14,528 16s. 2d.; the chief item under this head was in fees paid to the Council, Courts, and Boards of Examiners for their many meetings during the year—viz., £5,814 10s.; salaries and wages for the large staff of officers and servants for the three departments of museum, library, and college required £3,858 9s. 6d.; Government taxes, rates, and stamps absorbed £1,380 6s.; expenses in connection with the examination, £319 0s. 10d.; pensions, £278 12s., now reduced by £200 since the death of Mrs. Belfour, the widow of the late secretary; subscription to the statue of William Harvey, £105, leaving a balance at the banker's of £957 13s. 3d.

Health of our Troops at Cyprus.

The health of our troops at Cyprus is not so satisfactory as we should wish. From the latest intelligence from this island, it appears that although the fever and ague, that are very prevalent now, are not of a malignant type, they are diseases of a very depressing nature. Several of the staff officers and a large number of soldiers have been attacked. This fact is not one that can create surprise, considering the amount of exposure to which the men have necessarily been subjected, and the sanitary state of their surroundings. Not only has the heat been excessive, but the variations of temperature have been extremely trying. They have had the thermometer, under canvas, between 100 and 110 in the daytime, and falling as low as 67 during the night. Bell tents are ill-adapted for this climate. No doubt matters will improve in this respect when sites for cantonments are decided upon and huts erected.

Abscess of Lower Lip, attributed to Poisoning by Paris Green.

Dr. R. Wilson, of Washington county, N. Y., writes to the *Philadelphia Reporter*:—

"The ravages of the potato bugs in this section have caused the farmers to use an immense quantity of Paris green, to destroy them. About a week since a young man, by the name of Albert Calkins, picked an apple from the ground, where it lay among potato vines upon which 'Paris green' had been used, and ate it, or rather sucked the juice. Shortly his lower lip began to inflame, and after acute suffering an abscess formed, which, on being opened, discharged a large amount of pus. Abscess of the lip is not, I believe, of common occurrence."

Paris green is said to be a compound of arsenic and copper. Of Scheele's green, Dr. Taylor says that it produced, in a watchmaker, "swelling and ulceration of the lips."

Myositis Ossificans.

At the Vienna Medical Society, Docent Dr. Nicoladoni presented a girl, seven years of age, as an example of a very rare affection of the muscles, viz, ossification of the muscles of the trunk and limbs. The disease had been going on for about a year, commencing in the muscles of the neck, whence it extended to the spine, the anterior part of the thorax, and the limbs. On each side of the spine a rigid line (sacro-spinales) extends. The scapula is fixed to the thorax; and in the cervical regions are found fibrous cords containing bony plates. The right knee-joint is contracted, and the pectorales are almost entirely ossified. There are only three similar cases on record.

Overcrowding and Disease.

JUST as we are going to press the following facts are brought to our notice :—

The Coroner for Central Middlesex held an inquest on Saturday at the Board Room, Little James Street, Bedford Row, respecting the death of the illegitimate child of Elizabeth Mason, of 6 Half Moon Court, Gray's Inn Road. Evidence was given to the effect that the deceased had died from the close and stifling atmosphere of the room in which the family lived, that the house was crowded to excess from basement to roof with large families, living under the most unsatisfactory and unsanitary circumstances, and 2s. 9d. a week was paid for the room in question. The grandmother of the child stated that she was compelled to go out to work to help to support her children, and neither she nor her husband could afford to live away from London, but when the Metropolitan Board of Works had taken down the houses to make room for improvements, she, with hundreds of other families, had to manage as best they could, no additional places having been built for their occupation. She was five months before she could get a room suited to her means and near her work, and she, her husband, and four children all lived in one room.

At the time the foregoing inquest was being held, Mr. Peacock, the sanitary inspector for the district, received by post the following letter :—"Aug. 16, 1878. Sir,—As an inhabitant of this district I would call your attention to a case that requires investigation by the sanitary authorities, viz., where two men, three women (one just confined), and six children, are the occupants of one room at 21 Eagle Street, Red Lion Square, and at this season of the year, when fever is so easily engendered, it behoves all persons to endeavour to have those sanitary measures enforced that may tend to the prevention of disease."

We shall reserve our comments on this deplorable state of things for our next issue.

Scientific Education amongst Women.

SCIENTIFIC study does not yet appear to have attracted a superfluity of women, to judge by the number of candidates at the Cambridge Higher Local Examinations recently held. *Nature* says that only about thirty out of 500 took the science subjects ; twenty-one took botany, one failed, and three obtained distinction ; twenty-six geology and physical geography, of whom two failed, and seven were distinguished ; seven geology, one failed, three distinguished ; nine chemistry, three failed, none distinguished. Ten of the science candidates sat at Cambridge, and among them they gained ten out of fourteen of the distinctions given. Miss Clarke, of Cambridge, was distinguished in geology, zoology, and botany, and passed in chemistry. Mathematics got only twenty-three candidates, of whom four failed ; only two, however, were placed in the first class (being Cambridge students), and two in the second. We are glad to learn that two new subjects are to be set in the science group next year namely, physics and physiology, the latter so much needed in all girls' schools.

Kew Gardens.

IN the House of Commons on Monday evening, Sir T. Lawrence gave notice that early next session he should call attention to the regulations affecting the admission of the public to Kew Gardens, and should move that, in the opinion of the House, the whole or part of Kew Gardens should be open from 10 a.m. daily, and declaring that that there was no reason in connection with the maintenance thereof to justify the exclusion of the public till 1 p.m. In our last issue we entered so fully into the reasons why Kew Gardens should be more freely open to the public than they are, that for the present we need not make any further remarks on the subject. No doubt when the question comes before Parliament for discussion some strong representations will be made in the interest of the public ; but there is some reason to be afraid that might will prevail over right, and that the authorities at Kew will have too much influence over the Government to admit of their cherished arrangements being interfered with. However, we trust that all the supporters of the proposed reform will, in the meantime, do all in their power to attain the object they have in view, and to show by fair and temperate argument the good reasons they have for pressing the subject upon the attention of the House of Commons.

The British Pharmaceutical Conference.

THE meeting of the Conference which was held in Dublin within the last week may be taken as an unquestionable success. The number of members who attended was in excess of that at any previous meeting. The character of the scientific work done was quite up to the level of any former year, and the hospitalities extended to visitors by the Dublin Committee bore out to the fullest extent the character for good fellowship on which Irishmen are wont to pride themselves. Mr. Schacht, of Clifton, occupied the Presidential Chair, and the management of the conference was principally under the care of Professor Tichborne, Mr. Hayes and Mr. H. N. Draper. The last day of the meeting was devoted to an excursion to the County Wicklow and Glendalough, at which place those present were entertained at luncheon by the committee. The weather was happily propitious, and the excursionists numbered nearly two hundred. Finally, the assembly of the conference for the year 1878 was brought to a close by a valedictory dinner in the Exhibition Palace. The conference is obviously in a state of robust health, and, as far as we can judge, deserves its prosperity, and we trust that an organisation capable of so much benefit to pharmacy and, through it, to medicine, will continue to flourish.

Hydrophobia.

JOHN NUNN, a hay carter, has just died in Ongar Union House, Essex, from hydrophobia. He was bitten as long ago as May, 1874, by the same dog which bit Mr. Brown, veterinary surgeon, of Stanford Rivers, whose case excited so much interest about twelve months ago, and whose death from hydrophobia occurred three years after the bite.

Expectant Surgery.

A WRITER in *The Philadelphia Medical and Surgical Reporter* supplies us with an amusing illustration of the "take it easy" system of surgery. He deprecates the clipping, or scraping, or evulsion of the toe-nail in cases of in-growth, and propounds his views as to what ought to be done. Our friend here must wear a loose shoe, in the first place. This is a *sine quâ non*. Then the maltreated nail must be allowed to grow and regain its proper shape. While this is going on *she will suffer considerable pain*, but this will be her penance for having done wrong. *By the end of six months* the nail will have regained its normal outline. If much inflammatory action should continue while this is going on a slippery elm poultice may be applied from time to time. *The chances are, however, that our patient will become dissatisfied* in waiting so long for a cure to result, and resort to the fatal scissors, but we can at least give her fair warning of the long course of suffering which by so doing she will bring upon herself.

This valuable contribution to the surgery of a painful and refractory disease, reminds us of an occasion when we were driven by the torments of a toothache to seek a remedy in the cookery book. Turning up the index we found, "Toothache, remedy for," and hastened to the page that would teach us how to still our agony. We found the following: "Toothache — this distressing malady usually arises from exposure of the nerve, resulting from a carious cavity. Caries may be avoided by a careful attention to the washing of the teeth every day.

Mortality in Irish Workhouses.

WE learn from the recently issued Report of the Irish Local Government Board that the total number of deaths in the workhouses in the fifty-two weeks comprised in the table has been 11,190. In the last annual report the total number of deaths was set down as 10,129; so that there has been an increase of 1,061 deaths, as compared with the number last year. Deaths by fever were 617, against 612; by lung disease, 1,850, as against 1,633; and deaths by small-pox, 12, as against 2 in last year. An increase of 3,589 has taken place in the total number admitted in sickness during the year; an increase of 13,165 in the number admitted who were not sick; an increase of 364 in the number suffering from fever and other dangerous contagious diseases, and an increase of 16,754 in the total number relieved.

An Early Symptom of Tabes Dorsalis.

DR. BERGER has a note in the *Centralblatt für Med. Wis.*, relating to an early symptom of tabes dorsalis, which is described as consisting in the disturbance of the perception of pain of such a kind that stimuli of slight intensity, as well as tactile impressions of a slightly painful kind, such as needle-pricks, are perceived normally; but that more severe and often very strong stimuli produce no greater pain. This analgesia in respect to excessive stimuli may be present before other symptoms of tabes appear, and is of semeiotic importance. This peculiarity, as a common rule, is especially perceived in the skin of the lower extremities, and may finally be observed on the whole cutaneous surface, and even on the mucous membrane. It appears to be a symptom depending on an initial lesion of the grey substance.

Further Uses of Marsupials.

TENDON ligatures are now being generally used in surgery, and some have been prepared by Mr. Girdlestone, one of the surgeons to the Albert Hospital, Melbourne, from the tendinous structures of the kangaroo. In England they have been prepared from the tendons of the horse. Tendon ligatures, like those made of catgut, dissolve, but more slowly; are tougher, make better knots, and do not slip. They make capital sutures. It is usual to soak them in carbolic water before use.

Etiology of Diphtheria.

SOME interesting particulars bearing on the causation of diphtheria have recently been published in an American journal by Van Wagenen. The doctor believes in the filth origin of the disease, and he cites several cases in support of his contention. Of 112 cases concerning which observations are given, 59 followed direct exposure to the poison of the disease, whilst 13 more were suspected of having been so exposed. The greatest number of cases occurred amongst females, and in December; 74 of the cases were children under 10 years of age, and only 3 were persons over 40 years.

Dr. Baxter Langley.

A MEETING of the friends of Dr. Baxter Langley was held last Friday, at which a report was made to the effect that since his imprisonment in Coldbath Fields on the charge of fraud in connection with the Artisans' Dwellings Company, his health had been greatly impaired, and that he was now gradually sinking in the prison infirmary. A resolution was passed instructing Mr. T. N. Cathrall to lay the facts before Mr. Cross, in the hope that he would recommend the exercise of the Royal clemency.

The Humboldt Monument.

THE monuments of Alexander and Wilhelm Von Humboldt, the former by Professor Begas, the other by Herr Otto, will soon be erected, one on each side of the entrance gate to the Berlin University. Both monuments are in marble, and the figures are represented in a sitting posture.

AT the last Lurgan Petty Sessions Dr. Hugh A. Gribben, of Lurgan, was ordered to find bail for his good behaviour for twelve months, himself in £40 and two sureties in £20 each, or in default to be imprisoned for three calendar months at hard labour, for using threatening language towards his mother-in-law, Mrs. Alexander, of Corso Lodge. Having failed to find the necessary bail Dr. Gribben was arrested under a warrant and was yesterday conveyed to Armagh Gaol to undergo the term of imprisonment. It may be mentioned that Dr. Gribben served for some months as a medical officer with the Turkish army during the late war.

A SICKENING discovery has been made near Aberystwith. In a farmhouse, in a totally dark room, the

police have found a male lunatic, stark naked, wallowing in filth, and his body covered in sores. He is believed to have been confined in the same room during the past five years. It is reported that several lunatics are kept in private houses in the district, and that they are systematically neglected and shamefully treated.

A COURSE of six lectures on meteorology will be given under the auspices of the Council of the Meteorological Society of England, commencing in October next. The subjects of the lectures will be :—"The Nature and Physical Properties of the Atmosphere ;" "Air Temperature, its Distribution and Range ;" "Atmospheric Pressure, Wind, and Storms ;" "Clouds and Weather Signs ;" "Rain, Snow, Hail, and Electricity ;" and "The Nature, Methods, and General Objects of Meteorology." It is intended that these lectures shall give a concise account of the present state of knowledge on the above subjects. The lectures will be open to the public, admission being by ticket, to be obtained at the office of the Society, 30 Great George Street, Westminster, S.W.

ON Friday, August 9, the Société Française d'Hygiène held a banquet at the Continental Hotel, Paris, for the reception of the Sanitary Institute of Great Britain. Dr. Ricord was in the chair, assisted by M. de Lesseps and Anatole de la Forge, the Director of the Press Department in the Home Office. The toast of the Sanitary Institute was replied to by Mr. Chadwick, who handed to the Société Française d'Hygiène a diploma of affiliation signed by the Duke of Northumberland and Dr. Richardson. Some members of the English Ladies' Sanitary Association were also present at the banquet.

BY the death of Patrick Coleman, late of 2 Suffolk Street, in the city of Dublin, grocer and spirit merchant, who died on the 7th day of April, 1877, the following legacies are to be paid, viz :—St. Vincent's Hospital, £200 ; Mater Misericordiæ Hospital, £300 ; Blind Institution of Merrion, £300 ; Institution for Blind Boys at Glasnevin, £300 ; Cork Street Fever Hospital, £100.

BRITISH MEDICAL ASSOCIATION MEETING.

(Continued.)

ON the Thursday morning the Members of the Association in large number attended the breakfast of the Temperance League, under the Presidency of Mr. Samuel Bowley, who accompanies them year by year to elicit the opinion of the profession on the use and abuse of alcohol. There were the usual personal experiences of teetotalers, medical and other ; but the best they said was about the food value of alcohol. The speaker in urging upon the League the desirability of admitting that alcohol is a food, said "that its ordinary use did not rest upon its food value ; that before a man could make a substantial meal of alcohol he would be dead drunk." The League certainly has had an influence in inducing the profession to look more earnestly at the alcohol question than it otherwise might have done.

Then at eleven Mr. Wheelhouse gave his address on Surgery. Able, eloquent, and effective, Mr. Wheelhouse's address will rank amidst the best ever delivered before the Association ; rivalling, if not indeed somewhat excelling, the address in Medicine delivered on the Wednesday, by Dr. Goodridge, which is passing through our columns *in extenso*, so that our readers can judge of it for themselves. After this, papers were read in the sections, of varying value.

In the Medicine Section Dr. Althaus read a paper on Lateral and Posterier Sclerosis of the Spinal Cord, which elicited a good discussion. Syphilitic Disease of the Nervous System was discussed in a paper by Dr. Gowers and Dr. Dowse. A paper on Athetosis by Dr. Fletcher Bach ; one on Latent Pleurisy of the Apex, by Dr. Clifford Allbutt, and a short note on the Specific Origin of Diphtheria, by Dr. J. C. Ewart, were the leading events in this section.

In the Surgical Section Dr. Fowler read a paper on a Case of Lithotomy where the Supra-pubic Operation was resorted to in consequence of the size of the stone. This was a large mulberry calculus occurring in a boy of sixteen where the bladder was unusually high up. The operation was quite successful. Mr. Teevan contributed an account of Fifty cases of Lithotrity. A communication of the highest value, which unfortunately could not be discussed. Professor Humphry, of Cambridge, read a paper on Successful Removal of Fungus Growth from the Bladder, while Dr. Henry Humphry read a paper on Symmetrical Gangrene in Congenital Syphilis. But the address of the President on the Avoidance of Pain, was of such merit that it must be alluded to here, having merely been mentioned in our first account of the meeting. He said that "now from first to last a patient might undergo an operation freed from pain. By anæsthetics the operation was performed without the patient being conscious thereof. Then, by support, rest, and care, combined with the judicious use of morphia, all pain afterwards might be practically avoided." He gave the morphia hypodermically, by which plan the evil effects upon the stomach were largely obviated.

In the Obstetric Section papers were read by Dr. L. Weatherby on a case of Concealed Internal Uterine Hæmorrhage, and by Dr. Marion Sims, on Simpson's and his own operations for Stenosis of the Cervix Uteri compared. Then Dr. Lloyd Roberts contributed a paper on the Differential Diagnosis of Abdominal and Pelvic Tumours, which was followed by one on Chronic Cervico-Endometritis as a cause of Sterility, by Dr. Arthur Edis.

In the Public Medicine Section papers were read On the Organisation of Home Hospitals for Paying Patients, by Mr. H. C. Burdett ; on the Late Epidemic of Small-pox at Birkenhead, by Dr. F. Vacher ; Dr. Drew discussed the question of How Far the Flesh of Diseased Animals may be Safely used as Food ?

Some other matters of interest than the sections transpired on the Thursday. The Poor-law Medical Officers' Association held a meeting under the presidency of Dr. Joseph Rogers, of the Strand Union. The matters of cod-liver oil, genuine linseed meal, &c., were discussed, and the conclusions arrived at were, that it was undesirable in every way that such contracts should be entered into with medical men, for while one man might shirk his part, too many others furnished far more than was fairly due from them. It was carried unanimously that the principle of Mr. Hardy's Act be extended to the provinces—viz. : "That all drugs should be supplied at the expense of the ratepayers in every district of the kingdom."

More important still was the result of the special meeting to alter the bye-laws and to add a new article—viz. : "No female shall be eligible for election as a member of the Association." Dr. Wade, as chairman of the sub-committee on the subject, proposed the adoption of the article. Dr. A. P. Stewart seconded it, saying that he had signed the nomination paper of Mrs. Garrett Anderson, but still after such a very large preponderating majority of the members were against the admission of females, it was not right that their presence should be forced upon that large majority even to please a very influential minority. Dr. N. Kerr pleaded for their admission. Dr. Burchardt had no doubt that the opinion of the majority of the Association would change on the subject, and therefore he urged that the new article be not carried, but that they should trust to the good feeling of those who were their officers to carry out their wishes. Dr. Lisson said he had voted for their admission, but more recently had changed his mind. Mr. Husband supported the new article on the ground that the presence of females would interfere with the free discussion of certain questions. Mrs. Garrett Anderson then spoke at some length, taking a purely unpersonal view of the question. The objects of the Association, she said, were two, the advancement of medical science and the promotion of fellowship. As to the first it could not be promoted by excluding evidence of any kind, especially when it was evidence of a

peculiar kind which they were not likely to have in any other way. She thought, too, that in the matter of fellowship the female members of the profession were interested in it as much as the males. She expressed a very confident opinion about the vitality of the female medical movement. If men did not really like to discuss certain matters before ladies, then they must accept the decision. The motion was carried by an overwhelming majority.

The annual dinner was held in the Assembly Rooms in the evening, Dr. Falconer, the President, occupying the chair, and supported by the Mayor of Bath and the Rev. Canon Brooke, Dr. Waters, of Chester, the President elect, Dr. A. Carpenter (President of Council), Prof. Douglas Maclagan and a large number of members of the Association, and the American delegates. The usual speeches followed, which have little interest, except for members of the Association, who will find them fully reported in the journal of the Association.

On Friday morning, Prof. Douglas Maclagan gave the address on Public Medicine. He contrasted Scottish criminal procedure with that of England, and animadverted on the absence of a public prosecutor in England, and leaving prosecution to the individual. He regarded the office of coroner as virtually obsolete and unfit for the present time. The coroner was a relic of old Plantagenet times, when the jury as neighbours of the deceased might know something individually of the facts of the case. He, however, was opposed to medical coroners; he thought the lawyer on the bench and the doctor in the witness box the true relations of the two.

During this time there was a rapid disposal of the papers in the different sections. In the Medicine Section Dr. Bell, of Bradford, read a very interesting paper on Wool-Sorters Disease. It would appear that certain bales of woollen material, especially alpaca, if wet when opened give rise to a very virulent form of septicæmia. If allowed to dry they become quite innocuous. As to alpaca, it is often pulled from the dead animal after decomposition has rendered its removal easy. The septicæmia so set up may prove fatal in so short a time as twenty-six hours, or even in one case only seventeen hours. If death is not so swiftly induced then distinct local changes are found along with the septicæmia. There was also a paper by Dr. Fothergill, on "Gout at the Heart," and by Dr. Douglas Powell, on "the Elasticity of the Lungs and Chest Walls with reference to the signs of Chest Disease, and especially Pleuritic Effusion," while Dr. Tibbits read a paper on "Embolism of the Right Middle Cerebral Artery, followed by great loquacity. In the Surgical Section, Dr. Walker, of Peterborough, spoke of the treatment of Pott's Disease of the Spine by the plaster jacket applied in the recumbent posture. Dr. Charles Taylor gave a summary of Five Hundred cases of Cataract Extraction, and Dr. C. Higgins "Remarks on One Hundred and Fifty cases of Cataract Extraction." In the Obstetrical Section, Mr. Henry A. Allbutt contributed a paper on "How to reduce to a Minimum the Midwifery Mortality." Mr. Dolan, one on the "Facts of Puerperal Septicism." Dr. P. Smith read a paper on "The Positional Treatment of Pelvic Distortions and Uterine Displacements," and Dr. H. Smith one on "The Treatment of the Pedicle in Ovariotomy."

In the Public Medicine Section, Dr. Seaton read a paper on "The Compulsory Notification of Infectious Disease," which was followed by one by Mr. North on "The Registration of Infectious Disease," the views taken not harmonising. In the Physiological Section, Mr. Urban Pritchard described "The Development of the Organ of Corti." Prof. Rutherford gave a lecture on his experiments on the influence of drugs upon the production of bile, from which it seems that salicylate of soda has a very important action on bile production. At the concluding general meeting the matter of illegally elected members was discussed, when it was decided that those who had been illegally elected, who at the same time were legally qualified should be admitted. Mrs. Frances Hoggan not being legally qualified when elected was of course left out. The chief matter of interest was that of *the medal for distinguished merit* which the Association has instituted. It was decided that it should be charily given, in order to increase its value. Other journal matters followed, and the meeting was over.

In the afternoon, the Mayor of Bath gave a pleasant garden party to the members of the Association, which was well attended. In the evening, the Bristol members of the Bath and Bristol branch gave a splendid concert at Colston Hall, which was largely attended. Next day was devoted to excursions to various parts of the interesting West of England.

Literature.

THE THROAT AND ITS DISEASES (*a*)

In the preface Mr. Browne tells us that the pages are the result of eleven years of work mainly devoted to affections of the throat. This book, he says, has been written for the use of those engaged in active practice, and, therefore, prominence is given to matters tending to render diagnosis more accurate; but no attempt has been made to discuss questions of pathological interest. This omission, which Mr. Browne excuses, is certainly a great fault in the book. When the subject of throat diseases came first before us, as recognised by the aid of the laryngoscope, it was excusable that writers should explain appearances and the results of their treatment without entering into the *rationale*, but in these days we have recognised the fact that all knowledge of medicine and surgery depends entirely upon a knowledge of the pathological changes occurring. Signs and symptoms are only the reading of a disease. Pathological changes are the disease itself, and to attempt to deal only with signs and symptoms without investigating the disease is, in these days, empirical and unscientific.

The plates, ten in number, with eight to twelve figures in each, are, some of them, very well executed, especially those representing the larynx. The first plate shows the varieties of the normal larynx as seen in the mirror, and is instructive to beginners, for the normal larynx often presents appearances which, by the uninitiated, may be easily mistaken for disease. The body of the work is arranged in chapters, including one on the laryngoscope and rhinoscope, and the method of using them; the anatomy of the larynx; semeiology of throat diseases; therapeutics; and the special diseases of the several parts of the throat and larynx. The diseases are, in most instances, given much as they have been described by other authors.

The description of tonsillitis, however, would give to the student a strange view of the disease. The author says that the darthous or arthritic diathesis invariably exists in patients subject to tonsillitis, and then immediately afterwards quotes a whole page from Robert's "Practice of Medicine" (article, "Predisposing Causes of Rheumatism") to prove a "close relationship between tonsillitis and rheumatism." Whether or not Mr. Browne desires to infer that two diseases bearing a relation to a third likewise bear relation to each other is not evident, but the state of confusion of this chapter would have been avoided had the author, by a knowledge of pathology, recognised that the three diseases referred to are inflammations and therefore the predisposing causes of inflammation, especially exposure to cold and damp, would predispose to these diseases also.

On page 193 commences the subject of subacute laryngitis. Under this head the author says, "are considered all inflammations of a recent character not leading to œdema." What "all the inflammations" are to which the author refers it is difficult to conjecture, especially as it is impossible for any inflammation to exist without infiltration of serum, *i.e.*, œdema.

Taking the book as a whole, there is much that is good in it, and the publishers deserve great credit for presenting the volume as a very handsome production.

THE YEAR-BOOK OF PHARMACY FOR 1877.

A short notice of this work may not be inopportune, as we have just had a meeting in Dublin of the Pharmaceutical Conference (the Year-book is supposed to emanate from that body). Very few books could be more useful to the practical compounder, and if this Society did nothing else than issue year-books, it would deserve the thanks of all interested in pharmacy.

This book is supposed to give an abstract of all the work done during the year, and also to contain the Transactions of the Conference. It is divided into Pharmaceutical Chemistry, Materia Medica, with Notes and Formulæ. The whole is supplemented by a good index. We have no doubt that if the book was better known, it would greatly increase the Irish members of the Conference.

(*a*) "The Throat and its Diseases." By Lennox Browne, F.R.C.S.Edin. London: Baillière, Tindall, & Cox.

In glancing over its pages, however, we observe that it hardly does justice to Ireland, and that the work done in that country is persistently ignored. Of a very considerable number of valuable papers on Chemistry, Pharmacy, and allied subjects, with one exception they are passed over in silence. How is this? The one exception gives us the clue to the explanation sought; for it seems that the paper referred to was sent to the *Pharmaceutical Journal*, and on looking over the Year-book, we see that for British work, the Editor has mainly depended upon that journal. Now, as the said periodical is merely a Society Journal, it should not be depended upon as a Scientific Journal. The *Journal* of the Pharmaceutical Society, from pique, or some other cause, has most determinedly shut its eyes against Ireland, Irish pharmacy, and Irish science. Poor Ireland! We wonder who will get tired of this first, the Editor of the *Pharmaceutical Journal*, or his subscribers. But if the committee of publication of the "Year-book of Pharmacy" would wish to make the name something more than an empty title, they must search amongst other records for their matter.

Novelties.

CHAULMOOGRA OIL: A NEW REMEDY FOR SKIN DISEASES, SCROFULA, &c.

For many years this oil has been much prized by Indian native practitioners for its curative properties in skin diseases, leprosy, syphilis, scrofula, &c. Dr. J. Mouat, formerly of the Indian Medical Service, Dr. Dymock, of Bombay, and several other high authorities, have testified to its remarkable therapeutic virtues, but the difficulty with which the drug has been hitherto procured in a pure state has kept it in a comparative obscurity, so that its properties have not yet been thoroughly tested by Indian, much less by European, practitioners.

Thanks, however, to the careful researches of Dr. W. Dymock and to the commercial enterprise of Messrs. Corbyn, Stacey, and Co., the oil may now be obtained in this country in a perfectly pure state; and the great success that has attended its employment in many severe and obstinate cases of syphilis, scrofulous ulcers, and even leprosy, warrants our drawing the attention of the profession to it, and recommending a fair trial of it by all who have the opportunity of making one.

The plant which furnishes the oil is the *Gynocardia odorata* (Syn. *Chaulmoogra odorata;* natural order, *Pangiaceæ;* habit., India), and will be found fully described and illustrated in Bentley and Trimen's "Medicinal Plants." The Chaulmoogra is a large tree, whose fragrant flowers appear in April and May. The oil is obtained from the seeds, which are official in the Indian Pharmacopœia. When pure, the oil is clear, of a pale sherry colour, of a peculiar odour, and a specific gravity of 0·900. In contact with sulphuric acid, a pure sample gives a burnt sienna- and afterwards a rich olive-green colour, and without the formation of any tenacious reddish-brown resinous matter. With regard to its physiological action and uses, it is regarded as a powerful alterative and tonic, having, in the opinion of some, all the power of mercury as a curative agent without any deteriorating effect on the constitution. Scrofula and skin diseases, secondary syphilis, consumption, and leprosy are, as we have just said, the diseases in which it has been found most useful. Its curative properties are very striking in cases of scrofula in children, and it has also been beneficially employed in lupus, syphilitic rheumatism, and glandular swellings. The dose for adults is from 6 to 15 drops three times a day after meals. In skin diseases the oil should be also applied externally.

Medical News.

Royal Colleges of Physicians and Surgeons, Edinburgh.—*Double Qualification.*—The following gentlemen passed their first professional examination during the July and August sittings of the examiners:—Soloman Fernando, Ceylon; George Holt, ——; Powell Hudsmith, Bolton; Sarkies Carapiet Sarkies, Dacca, Bengal; Edward George Geoghegan, Dublin; Stephen Frederick Rowan, St. John, New Brunswick; John Minchin Whitaker, Dublin; John Frederick Arlidge, London; Richard Fowler, Dublin; George Skirving, Dublin; Richard Woodward Isbell, Herefordshire; Frederick William John Cox, Edinburgh; William George Kynaston Barnes, London; Wm. Cotton Cornwall, Ballygar; John Henry Lowry, county Down; Augustine William Sinclair, Edinburgh; Francis Edward Cane, Kilkenny; Arthur Nathaniel Davis, Newport, Mayo; Charles Armstrong, Tyrone; John Connal Wilson, Berwick-on-Tweed; Thomas Robert Horton, Melbourne; Reginald Latimer Wellington Greene, Antrim; Nathaniel Wheatcroft Holmes, Derbyshire; George Hill Healy, Dublin; Alexander Wallace, Ballymena; William Ring, Cork; William Clarkson Clarkson, Bradford; Owen Griffiths, Nevin; Charles John Mc'Farlane, county Tyrone; Jason Thomas Phillips, Carmarthenshire; James Alexander Mather, Fife; Thomas Bouser White, Sheffield.

And the following gentlemen passed their final examination, and were admitted L.R.C.P. Edinburgh, and L.R.C.S. Edinburgh:—Henry Charles Sloggett, Devonport; William Campbell, Caithness; Hubert Lindsay Miller, Tasmania; James Mackay, County Tyrone; William George Mawbey, Northampton; Robert Nesmith Paton, Manchester; Sarkies Carapiet Sarkies, Dacca, Bengal; John Francis Grayling, Sittingbourne; Henry Hugh Master, Norwich; James Thoburn M'Laren, Bedlington; Henry Croker Garde, county Cork; Solomon Fernando, Ceylon; John Lindsay, county Antrim; Patrick Francis Black, county Meath; Arthur Kyffin Crossfield, Carnarvonshire; John Brett Johnstone O'Meara, Dublin; John Farrar Roberts, Bangor; William Chalmers Cowan, Dundee; Harvey Robins, Portsmouth; James John Frederic Barnes, London; Duncan Simpson MacDonald, Glasgow; William Galbraith, Ayr; George Anthony O'Connor, Galway; William Cole Haime, Cornwall; Frederick Thomas Main, Blackburn; Jacob Hartman, Prussia; Henry Thomas Thomlinson, Coventry; James Arthur, Dundee; Henry Brewin Noble, Loughborough; Richardson Joseph Boustead, Wigton; Alfred Degardins, Calais; George Douglas Pidcock, Leicestershire; Peter Anderson, Perth; Walter Kent, Cheshire; John M'Cay, Canada; John M'Crimmon, Canada; John Purcell, county Clare; Peter M'Laren, Prince Edward Island; Wm. IRISH POOR-LAW INTELLIGENCE.

THE ABUSE OF DISPENSARY MEDICAL RELIEF.

THE following important letter has been addressed by the Counell of the Irish Medical Association to the Local Government Board. It is, surely, not unreasonable to hope that the L.G.B. will see the necessity of enforcing its own regulations.

Irish Medical Association, Royal College of Surgeons,
Aug. 17th, 1878.

SIR,—The attention of the Council of the Irish Medical Association has been repeatedly directed to irregularities which are of frequent occurrence in the issue of tickets for dispensary medical relief, and which appear deserving of earnest consideration, inasmuch as they are productive of considerable loss to the ratepayers, and of great injustice to the dispensary medical officers.

In the "Directions for filling up Tickets," as set forth in the General Rules for the Government of Dispensary Districts, it is ordered that "the ticket and counterpart are both to be filled up by the person authorised to issue the ticket," and "care should be taken in the issue of tickets accordingly." And again: "Any further observation which the grantor of the ticket may desire to make for the information of the medical officer should be written," &c. Furthermore, it appears from the 7th section of the Medical Charities Act, that the privilege of issuing dispensary medical relief tickets is confided to guardians of the poor and members of the committee of management of the dispensary, who, possess a considerable property qualification, as well as to wardens and relieving officers, and those persons selected presumably as having a personal knowledge of the poor of the district, and as being trustworthy to exercise a firm discretion respecting the right of any individual to be considered a "poor person."

With a view to preventing imposture or abuse of the system, the Council of the Irish Medical Association submits that the deliberate intention of the law and of the Regulations pointed out, is that strict inquiry should be made as to the circumstances of each person seeking medical relief, and that the grantor of the ticket should be *himself* responsible to make such inquiry, and to issue tickets to none but "poor persons;" and evidently in order that the responsibility should be fixed upon the individual, it is ordered that the name, age, residence, and occupation, of the person to receive the relief shall be entered in the ticket by the hand of the grantor himself.

The Council is aware that, so far from the intention of the law or the requirements of the Regulations in this respect being universally complied with, it has become quite usual for a Guardian, Warden, or member of a Dispensary Committee to sign dispensary medical relief tickets *en bloc*, and to leave them so signed, to be issued by irresponsible persons who may or may or may not take the trouble of inquiring as to the circumstances of the persons for whom they are issued, and who are not instructed to refuse tickets in unsuitable cases; even to children and to shop assistants, who fill in the particulars required to be stated relative to the person who is to receive the relief and issue the ticket, without sufficient consideration or inquiry, and with little knowledge of his or her circumstances. Nay more, the Council have been assured that the privilege of granting medical relief has, in many instances, been made use of as an inducement to the working classes to deal at the shop kept by the Guardian, Warden, or Member of Committee, (as the case may be), the ticket being filled up by the shop assistant as a matter of course, and it being generally understood in the neighbourhood that customers of the shop have a special right to receive tickets, and are never refused.

It is hardly necessary that the Council should point to the effect of this promiscuous issue of dispensary medical relief tickets to persons who are not at all "poor" in the sense which the law contemplated, and who, in any other division of the kingdom, would not be recognised as entitled to receive medical charity. The Council believes that, were dispensary medical relief strictly confined to those who are really unable to pay for medical attendance, a very large proportion—probably one-third, or even more, in many districts—of those now attended at the expense of the ratepayers would not receive tickets, and not only the dispensary medical officers, but also the poor-rates would be proportionately relieved. It is also obviously a great hardship that, in consequence of the ambiguity of the words "poor person" contained in the Act—the frequency of the irregularity referred to—and the absence of any practicable means by which he may counteract the effect of such a system, the medical officer is compelled to attend many persons in independent circumstances, which, at the same time as it burthens him with improperly gratuitous labour, deprives him of his legitimate professional earnings.

I am directed by the Council to point out that the existing procedure for cancelling tickets affords the dispensary medical officer no practical protection from such abuse, and that he may be obliged to attend any case, however undeserving, to its termination, before an opportunity is afforded him of having the ticket cancelled.

And I am further to observe that the power of cancelling tickets is not as frequently exercised by the Dispensary Committee as it should be, and because even in the most flagrant instances of abuse of the system, the Committee hesitates, or fears to take that course, lest by so doing they should offend the issuer of the ticket, the abuse of medical relief is frequently allowed to pass unchecked; whilst, not unfrequently, after a ticket has been cancelled another is issued immediately for the same person, thus setting at nought the terms of section 9 of the "Medical Charities Act," with regard to cancelled tickets, that the holders thereof are disentitled to further relief.

And, I am furthermored directed to express the opinion of the Council that it is inexpedient and unjust that the dispensary medical officer should be under obligation to attend upon a ticket, the issue of which has been declared to be irregular and improper, and an abuse of the powers of those authorised to issue tickets. In view of these circumstances, the Council trusts that the Local Government Board will take steps to ensure that its own Regulations upon this subject shall be carried strictly into effect; and that if it be considered essential that the medical officer shall act upon tickets irregularly filled, the Board will, at least, adopt all possible means to prevent such irregularity, and will, with this object, again call the attention of those who are charged with the issue of tickets to the words of the Regulations, and express

officially a decided opinion as to the impropriety of the course to which attention is now called.

I am, Sir, yours &c.,

JOHN WILLIAM MOORE, M.D.,

Hon. Sec, to the Council of the Irish Med. Assoc.

To the Secretary of the Local Government Board for Ireland.

ABSTRACT OF THE ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD FOR IRELAND.

Local Government Board, Dublin, 30th March, 1878.

MAY IT PLEASE YOUR GRACE,—We, the Local Government Board for Ireland, submit to your Grace this our Sixth Annual Report under the statute 35 and 36 Vic., cap. 69, entitled "The Local Government Board (Ireland) Act, 1872."

The following tables represent in figures the maximum, minimum, and average daily numbers for the whole series of seven years :—

IRISH POOR-LAW RELIEF.—MAXIMUM, MINIMUM, AND AVERAGE NUMBERS RELIEVED PER ANNUM.

RELIEF IN WORKHOUSE.

	Maximum Numbers.	Date.	Minimum Numbers.	Date.	Average daily Number.
1871-72	51,927	25 February, 1871	39,606	26 August, 1871	45,338
1872-73	54,125	8 February, 1873	39,464	31 August, 1872	45,753
1873-74	52,954	1 March, 1873	40,924	6 Sept'mber, 1873	46,673
1874-75	52,110	28 February, 1874	42,283	29 August, 1874	47,113
1875-76	51,599	27 February, 1875	39,908	28 August, 1875	44,800
1876-77	48,459	11 March, 1876	38,789	26 August, 1876	43,235
1877-78	51,720	2 February, 1878	40,179	1 Sept'mber, 1877	44,676

OUT-DOOR RELIEF.

	Maximum Numbers.	Date.	Minimum Numbers.	Date.	Average daily Number.
1871-72	28,490	17 February, 1872	22,665	7 October, 1871	22,552
1872-73	32,936	15 February, 1873	24,527	5 October, 1872	27,509
1873-74	33,710	1 March, 1873	26,733	4 October, 1873	30,176
1874-75	32,935	21 March, 1874	26,739	10 October, 1874	30,319
1875-76	33,151	20 March, 1875	26,957	18 Sept'mber, 1875	30,246
1876-77	33,976	25 March, 1876	29,076	7 October, 1876	31,600
1877-78	37,103	9 February, 1878	30,963	6 October, 1877	33,547

In our Annual Reports dated 1876 and 1877 respectively, we noticed a decrease in the average daily number of workhouse inmates for two years in succession.

In the present Report we are called on to report a change in the other direction, the average daily number being 1,441 more than in the preceding year. The comparison shown by the latest weekly return with the return at the corresponding period of last year is still more adverse, being in excess thereof by 4,277, the difference between 47,425 inmates in 1877 and 51,702 in 1878.

The out-door relief lists at the same periods show an average daily number of 33,547, in comparison with 31,600 in the previous year, and on the latest return an increase of 3,210 over the number in the corresponding return of last year. This fluctuation in the number of persons relieved by admission to the workhouse or otherwise, is perhaps no more than might have been expected from the indifferent harvest of 1877, and the inclemency and wetness of the subsequent season. Since the com-

FINANCIAL STATISTICS OF YEAR ENDED 29TH SEPTEMBER, 1877.

Year ended 29th September	Net Annual Value.	Poor Rate lodged.	Poor Relief Expenditure during the Year.							Numbers relieved.			
			In Maintenance and Clothing.	Out-door Relief.	Cost of Relief in Blind and Deaf and Dumb Asylums and Extern Hospitals.	Salaries and Rations of Officers.	All other Expenses.	Total.	In Workhouse.	Out-door.	In Blind and Deaf and Dumb Asylums.	Total
	£	£	£	£	£	£	£	£				
1877	13,540,515	877,432	405,755	102,227	10,035	129,644	132,665	780,326	199,083	67,237	711	267,031
1876	13,512,652	938,618	399,097	97,403	8,840	128,723	129,092	763,155	183,321	66,116	658	250,095
Increase ...	27,863	—	6,658	4,824	1,195	921	3,573	17,171	15,762	1,121	53	16,936
Decrease ...	—	61,186	—	—	—	—	—	—	—	—	—	—

mencement of the present improved spring weather the increase of the weekly admissions to the workouse has been arrested, and the gradual decrease of number usually commencing at the end of February in each year has set in as heretofore.

On the last Saturday of February the total number of persons receiving relief out of the workhouse under the 1st section has increased from 32,429 to 35,535, a difference of 3,106, including an increase of 1,169 in the class of "permanently disabled," of 1,131 in the class of "widows with two or more legitimate children," and of 806 in the class of "persons disabled by severe sickness or serious accident."

The total number of deaths in the workhouses in the fifty-two weeks comprised in the table has been 11,190. In the corresponding table in the last Annual Report the total number of deaths was 10,129 ; so that there has been an increase of 1,061 deaths, as compared with the number last year.

Deaths by fever were 617, as against 612 ; by lung disease, 1,850, as against 1,633 ; and deaths by small-pox, 12, as against 2 in last year.

It will be observed from the table of admissions to workhouses, that an increase of 3,589 has taken place in the total number admitted in sickness during the year ; an increase of 13,165 in the number admitted who were not sick ; an increase of 364 in the number suffering from fever and other dangerous contagious diseases, and an increase of 16,754 in the total number relieved.

We deal in the first place with that part of the Union expenditure which relates exclusively to the relief of the poor, of which the following table affords an abstract for all Ireland, for the year ended 29th September, 1877, in comparison with that for the year which ended on the same date in 1876.

From the above table it will be seen that there has been an increase of £6,658 in "in-maintenance and clothing," an increase of £4,824 in "out-door relief," of £1,195 in cost of "deaf, dumb, and blind," £921 in "salaries and rations of officers," and of £3,573 in "all other expenses," making a total increase of £17,171. The increase in the total number relieved has been 16,936.

Treasury Subsidies.

The following is a statement of the Parliamentary grant for medical and educational purposes, and for salaries under the "Public Health (Ireland) Act, 1874," for the year ended 25th March, 1877 :—

	Amount allowed for the Year. £ s. d.
Medical purposes	69,773 15 6
Educational purposes ...	9,072 19 3
Total for Medical and Educational purposes	78,846 14 9
For Salaries under Public Health Act	13,347 18 2
Total	92,194 12 11

The total amount allowed under the Parliamentary grant for medical and educational purposes for the year ended 25th March, 1877, namely, £78,846 14s. 9d., is £345 0s. 7d. more than the amount for the previous year.

The amount for salaries under Public Health (Ireland) Act, namely, £13,347 18s. 2d., is £1,180 17s. 3d. more than for the previous year.

Expenditure for all Purposes for Twenty-one Years Past.

While the total expenditure of poor rates for all purposes, viz., relief, medical relief, burial grounds, registration of births, deaths and marriages, sanitary measures, expenses under Superannuation Act, payments under Cattle Disease Acts, and under National School Teacher's Act, was, in 1876, £1,045,505, making a poundage of 1s. 6½d. on the valuation ; in 1877 the expenditure for those purposes was £1,030,798, thus showing a decrease in the total expenditure of £14,707. There is, however, an increase on the total poor relief expenditure for the year 1877 of £17,171, but this is more than counter-balanced in the total expenditure, by a net decrease in the other items of expenditure, amounting to £31,878, leaving the actual decrease on the total expenditure for the year £14,707, as above stated.

The current sanitary expenditure for the year was £44,870, in comparison with £39,676 in the previous year.

(*To be continued,*)

BALLINA FEVER HOSPITAL.

Dr. Nolan complained that the pauper nurses cannot be depended on to give the liquor, which I consider absolutely necessary. The hospital nurse could go over to the fever hospital twice in the day, and see the liquor administered herself. One of the patients has to get 6 oz. brandy, and if he does not get it he will probably die.

Mr. Thompson—The stimulants are administered to produce a certain effect. Is there an increase of fever in the country ?

Dr. Nolan—There is, most of which I attribute to the cheap bad meat sold in Ballina.

Ordered that the hospital nurse be directed to attend to the patients referred to in the doctor's report.

ELECTION OF A CORONER FOR THE CO. MONAGHAN.

The Under Sheriff for Monaghan attended in the Court-house, to conduct an election of a coroner for the northern division of the county.

Edward Richardson, Esq., J.P., D.L., proposed Robert Hamilton Reid, Esq., M.D., as a fit and proper person to fill the office of coroner.

Dr. Reid having complied with the requirements of the Act, by producing his qualifications and lodging the expenses of the election, was declared by the Sheriff duly elected, no other candidate having been proposed.

Dr. Reid thanked the electors in very happy terms for the confidence they had reposed in him, and assured them he would discharge the duties to the best of his ability, in obedience to the law, and to the benefit of the country, and having taken the oaths to that effect, the proceedings terminated.

MOUNTMELLICK UNION.

THE CLONASLEE DISPENSARY DISTRICT.

Mr. Cobbe adverting to the resolution passed last board day, to pay Dr. Rice two guineas a week for discharging Dr. Neale's duties, suggested that it would be well to reconsider that decision. If a man received an injury in the discharge of his duty, undoubtedly it would be only fair to pay his locum tenens, but if the contrary were the case—if they were able to prove that the accident did not occur to the officer in the discharge of his duty, and further, that it did not occur even within his district, he did not see why the ratepayers should be called upon to pay his substitute. He then proposed the following resolution :—

"That, inasmuch as it appears that the injuries which Dr. Neale is reported to have received, did not occur in the discharge of his duty, or even within his district, resolved, that we consider the said doctor should pay his locum tenens, and we hereby cancel the order made this day week for his payment."

If he had known as much of the case last week as he did now, he would not have been a party to passing a resolution to pay Dr. Neale's substi tu e.

Mr. Cobbe—It is contrary to all precedent to pay hi

substitute. I defy Mr. Millner to show me any case on the records analogous to it.

The meeting then divided, when there appeared for rescinding the resolution of last week, 6 ; against, 3.

ATHY FEVER HOSPITAL.

THE following letter was read from Dr. O'Neill :—

To the Board of Guardians.
Board room, Athy Union,
August 7th, 1878.

Gentlemen,—After close observation of the working of your staff in the Fever Hospital, I have come to the conclusion that it is a perfect failure ; and if you do not take prompt steps to improve it, I think you would be doing your duty towards the public if you informed them by advertisement that you do not wish them to take advantage of the institution at all—in fact that it would not be safe for them to do so. Very few people, except members of the medical profession, can be had to work for nothing, or very little more, and unless you take my advice regarding the salaries of matron and nurses you cannot hope to have the place better than it now is—a mere mockery and a snare.—Your obedient servant,

P. L. O'NEILL.

Chairman—Now, gentlemen, that is a letter requiring your most careful consideration. It appears to me to be a most extraordinary production. If the hospital is a mockery and a snare, why have we not been informed of it before now ? Has there ever been a report on the subject ? If the doctor considered he had not sufficient nurses in the hospital, I could quite understand his writing to us, and stating so, but to write a letter of that nature appears to me as most extraordinary.

Mr. Dunne—I quite agree with you. It is the most extraordinary letter I have ever seen from a professional man. If the doctor considers he is inadequately paid the remedy is in his own hands.

Chairman—I consider it a most uncalled for thing for an officer of this board to recommend us to advertise our hospital to the public as a delusion and a snare. It is also a most uncalled for thing for one officer to recommend the raising of another officer's salary. It is quite competent for any officer who considers he or she is insufficiently remunerated to apply to this board for redress.

Mr. Dunne—Has the doctor been refused anything he asked for ?

Chairman—On the contrary we have complied with his wishes so far that we have a higher average cost for our hospital necessaries than any of the neighbouring unions.

Mr. Byrne—It was reported here that a nurse was wanted, and I understand we advertised for one at a salary of £12 a year, and received no replies. Under the exceptional circumstances that exist at present, I would recommend we offer £15 a year.

Mr. Dunne—But it is not clear from the doctor's letter what he wants. Is it not customary for him to attend the meetings of this board ?

After a desultory conversation, the subject was brought to a close by the clerk being directed to issue advertisements for a nurse for the Fever Hospital at £15 per annum and rations.

BALLICKMOYLER DISPENSARY.

A MEETING of the committee was hold last week for the purpose of electing a successor to Dr. F. V. M'Dowell, who has been recently appointed medical officer of Baltinglass dispensary. There were three candidates for the vacant medical officership—namely, Dr. Oulton, who has been in temporary charge of the district ; Dr. Battersby, Dublin ; and Dr. Smith, of Ferns, who did did not go to the poll. For Dr. Oulton there voted 15 ; for Dr. Battersby, 3.

CORRESPONDENCE.

THE PERMISSIVE SUPERANNUATION ACT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The following may serve as a specimen of the working of the Permissive Superannuation Act, which might, without any great strain of imagination, be called "The Flunkey's Act." Mr. P. (Guardian of —— Union), meeting Mr. G. (Guardian of same Union): "Good morrow Mr. G., Fine day," &c. "How were sheep at the fair of ——," &c. "You were'nt at the Board on Wednesday. I was, and I tell ye, we supported ould Dr. S. well for his pension—Shupernuashin they call it. I stuck to him, and mean to do it, through thick and thin, and good right I have, for did'nt he cure my son of a bad fever that lasted three weeks ; visited him a'most every day, and sometimes twicet a day, and gave him the best of physic, and charged nothing at all ; besides, he has attended my family for the last seven years, not a penny iver he charged, *or got*, except a couple of loads of hay, and now and then a sack of pitaties. He's a good soul, that he is."—Mr. G. (*loquitur*) : "Well P., no doubt Dr. S. has been kind to you ; and as the saying is, '*one good turn deserves another*,' I'll support him too, as he has been equally civil to me ; and more, he says as long as he is in the country, and because I always stick to him, not a penny he'll charge for physic, or anything he can do for myself or family ; and if he doesn't charge, how is he to live ? 'Live, and let live,' is my motto. '*Do for him as does for you.*' There's Tim Brogan, because his wife died, he laid a complaint against the doctor, for not going to see her at oncet, on a red ticket, when he had to come to see my Katty, who had a sore head. What d'ye say Tim's wife died of ? Some swelling in the groin—stranglate hernye, they call it—and they said, if the doctor had been a day sooner, the woman would have lived. No ! the doctor says she couldn't have lived in any case ; and he should know best. That same Tim is getting 2s. 6d. a day for mowing—but spends it all, and won't have a halfpenny to rub again another, when the season's over. Save nothing, and then go on the rates, when the pinch comes." —Mr. P. (*loquitur*) : "At any rate, Tim's complaint did him no good, and the doctor no harm. Dr. S. is a favourite with Lord Plentiful and Mr. A. ; and they rule the committee, and so the matter was smoothed over, and went no further. If it had been Dr. M., I'm thinking, he wouldn't have got off so easy. Would have had a sworn investigation, and who know's what would be the end of it ? might have been dismissed—as he's no favourite."

If the above be accepted, you may get more soon from,

Yours, &c.,
ASPER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Would any of your readers kindly state through your columns if they have ever heard of any part of a country where hounds could not follow the scent of a hare, or to use the huntsman's term, "*the scent does not lie*," and if they could trace any connection between such a locality and severe hay asthma and catarrh. Although there are few flowers in bloom so early in the spring when the hounds are out, much less in winter, may there not be some herb which irritates the mucous membrane of the nose of the hound ? I believe I can connect such a case with a locality.

I would also like to ask if it can be considered necessary medical attendance to attend the wives of the constabulary force in cases of NATURAL LABOUR, when a qualified midwife, where such can be readily procured, would be sufficient. If members of the force wish medical men to attend in cases of natural labour instead of a nurse, I am of opinion they could well afford to pay for same, and that a medical officer might refuse to attend unless in unnatural cases.

It would also be a great boon if there was a rule that they should seek advice by ten o'clock in the morning (*unless in accidents or urgent cases*), which rule many committees make in regard to red tickets, as it is most inconvenient to have them coming in the evening or almost at night ; in fact, it would be often impossible properly to discharge dispensary duties without such a rule.

Yours,
A MEDICAL OFFICER.

THE MECHANICAL SYSTEM OF UTERINE PATHOLOGY.

By GRAILY HEWITT, M.D. Lond., F.R.C.P.,
President of the Harveian Society, &c., &c.

LECTURE I.—(*Continued*).

(*Continued from page* 139.)

In the accompanying drawing (Fig. 2) the range of the normal antero-posterior motion of the uterus is represented. The dotted outline *a*, *a'* shows the normal position of the uterus. The two figures *b*, *b'* and *c*, *c'* represent the position of the uterus when moved forwards or backwards within the range which has been above indicated. The body of the uterus has a greater play than the cervix. It is assumed that movement of the uterus forwards or backwards is attended with two other changes, which are represented also in the drawing—one is a slight descent of the uterus as a whole, the other is a very slight bend of the organ. The cervix moves, probably, forwards or backwards much less than the body of the uterus, and this difference is represented in the drawing. The axis of rotation is placed at the internal os uteri.

It seems to be certain that, if the uterus were not a comparatively rigid organ, the extent to which the fundus might be inclined backwards or forwards, in obedience to the action of forces applied from above, would be considerable. The bladder is, in some degree—when full, at least—a protection against anterior displacement; but against posterior displacement there is less security, unless it be the slight natural inclination of the uterus forwards. This comparatively unprotected condition of the fundus uteri appears to be necessary in view of the physiological enlargement of the body of the uterus which must necessarily occur during pregnancy. Firm attachments of the summit of the fundus would necessarily interfere with the expansion and enlargement involved in the progress of pregnancy.

The chief protection which the uterus appears to have against forces tending to incline the fundus unduly forwards and backwards is the resistance offered by its own tissues. In a state of health the unimpregnated uterus has considerable firmness and solidity. Its tissues resist section by the knife, and the walls are of considerable thickness, even at its central part, where the walls are thinnest. When the tissues of the uterus are in a sound state, and the nutrition of its various parts duly maintained, the firm walls of the organ offer an elastic, strong, spring-like resistance to any force tending to induce a strong inclination forwards or backwards; and when the force applied is sufficient to produce a notable effect in displacing the fundus, the uterus thus possesses in itself a power of righting itself.

The uterus is composed, as is well known, of a fibro-muscular material, having considerable firmness of texture. Its walls are of considerable thickness; although at about the centre of the organ they are somewhat thinner than elsewhere, the difference is not remarkable. The cavity of the uterus is small in proportion to the thickness of the walls (of course this description applies to the uterus prior to the occurrence of pregnancy alone); and hence the uterus is virtually a solid organ, having below a narrow canal, and above a flattened compressed cavity. The thickness of the uterine walls is, in fact, such that, coupled with the firm resisting structure of which they are composed, the organ in a state of health resists any attempt to bend it, and so alter its shape, in a very decided manner. This construction of the uterus it is which imparts to it a solidity and power of maintaining its shape which are highly important to it. In speaking of the attachments of the uterus, mention was made of the comparative freedom which the body of the uterus enjoys, due to the absence of ligaments superiorly, and the absence of such ligaments is to a great extent made up by the firm resisting thick walls which the uterus possesses, and which aid it materially in preserving its shape under adverse circumstances.

The vascular apparatus of the uterus has an important share also in contributing to the preservation of its shape. The vessels are numerous, the cavities of the uterus, or

sinuses as they are termed, and which are parts of the vascular system of the organ, are of considerable capacity, and when the circulation is proceeding healthily and regularly, the tension of the full blood-vessels will contribute to the firmness of the organ as a whole, and consequently to the preservation of its natural form and shape. In fact, by some authorities the uterus is regarded as a partly erectile organ.

What actually happens when a strong force is applied to the fundus from above, is that the fundus first gives way, next the uterus is a little bent at its middle. Next follows a certain degree of version of the uterus as a whole, the cervical part of the organ taking the opposite direction to the fundus. Coupled with these alterations there is in most cases a certain degree of depression of the uterus as a whole in the cavity of the pelvis. In the end the action of the force is or may be such as to produce descent of the uterus, version, and a certain amount of flexion. From all these effects, however, the uterus may, if in a state of health at the time, and if the force has not exceeded a certain point, recover, and resume its natural shape and position. But for the power of so recovering itself it is for the most part, I believe, dependent on the elastic firm resistance of its own tissues.

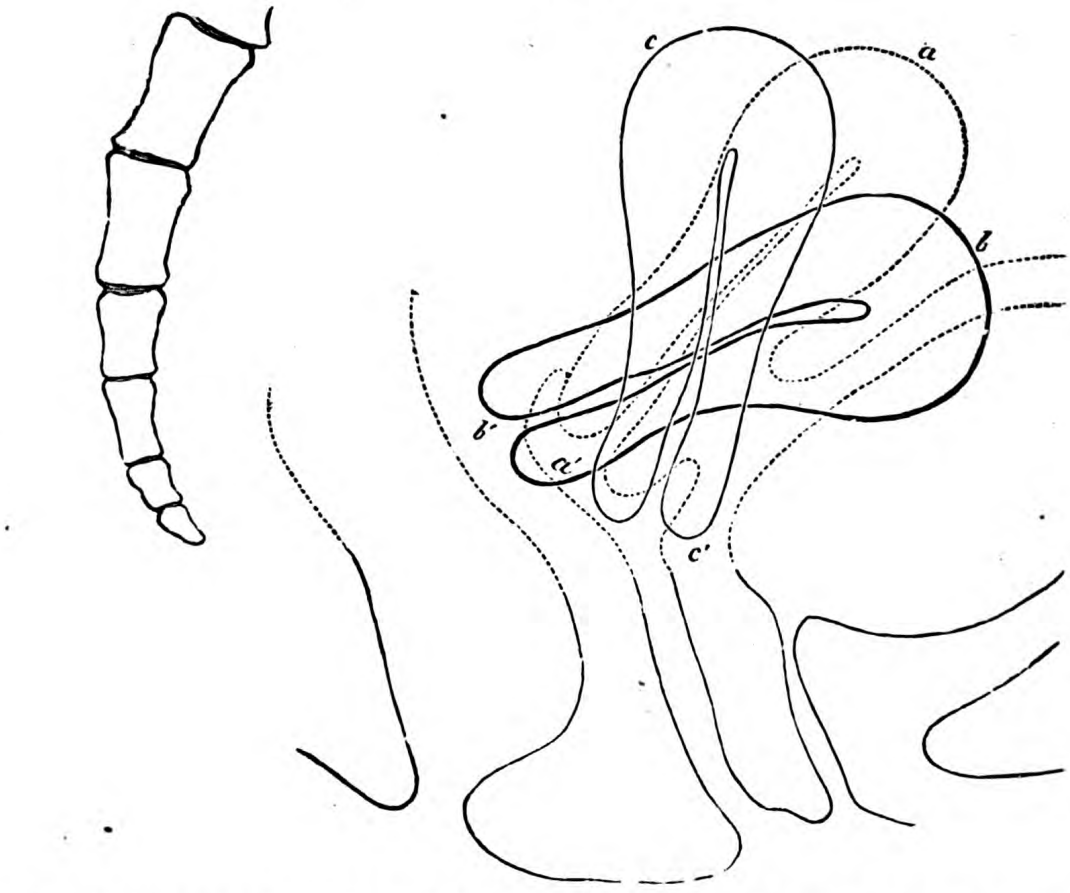
As regards descent of the uterus as a whole in the pelvis, there are certain points requiring notice. Descent of the uterus in a state of health is limited ; and uncomplicated descent of the uterus—that is to say, unaccompanied with anterior or posterior displacement—is rare. At least, this statement holds good so long as no part of the uterus passes downwards beyond the vulva. External prolapse of the uterus, or procidentia, has been known to occur suddenly, and in cases where no previous dislocation of the uterus had occurred. The force required to effect such a change must be very considerable, and the respective share which the various attachments of the uterus have in preventing such an accident, has been made the subject of an interesting experimental investigation by Dr. Henry Savage.

The early history of chronic cases of complete prolapse is not seldom obscure, but it seems very probable that in very few does the uterus come down from the first with its long axis in the proper direction.

A further element to be considered in estimating the effect of a downward acting force on the uterus is the condition of the perineum. That the bladder in part acts as preventive of the occurrence of anteversion is undoubted ; but the bladder itself requires support, and if the floor of the bladder be not properly sustained by the perineum, it may give way. Thus we may have, as a natural sequence—1, rupture of the perineum ; 2, anteversion ; 3, cystocele ; 4, exaggeration of the anteversion or flexion ; and later on there may be 5, external prolapse. The deficiency of the perineum may likewise induce exaggeration of an existing retroversion or flexion which may finally end in complete prolapsus of the uterus.

I have said nothing in reference to lateral movement of the uterus. The lateral movement is, naturally, very slight, the uterus being comparatively well fixed by the broad ligaments as well as by the general connections of the uterus, its vessels, &c., which enter it on its lateral aspects.

FIG. 2.



F . 2 exhibits in outline what may be termed the normal range of antero-posterior motion, or the reverse, of the uterus. *a a'* the normal position, *b b'* the extent of anterior motion, *c c'* that of posterior motion.

The possible alterations in the position and shape of the uterus induced by action of external forces are :—

1. Slight version anterior or posterior.
2. Slight descent of the whole uterus.
3. Considerable version, generally associated with flexion.
4. Considerable descent of the uterus as a whole in the pelvis.

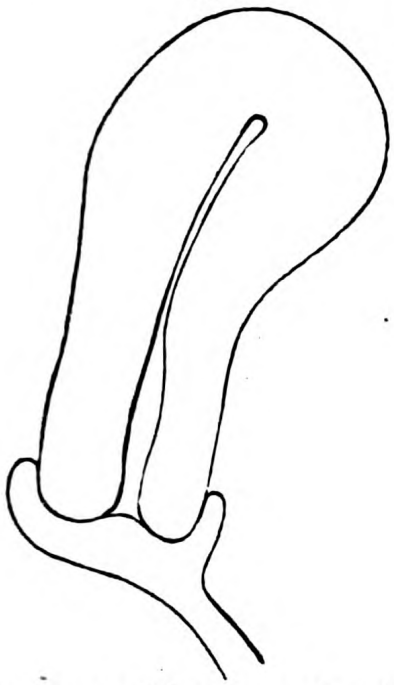
In practice we find the above more or less combined in different cases.

Varieties of Flexions.

The accompanying drawings represent the principal varieties of uterine flexions, and they may be taken as typical varieties. The distinction between first, second, and third degrees is of course a purely arbitrary one; but some such distinction renders description more readily intelligible.

Fig. 3 represents the outline of the normal virgin

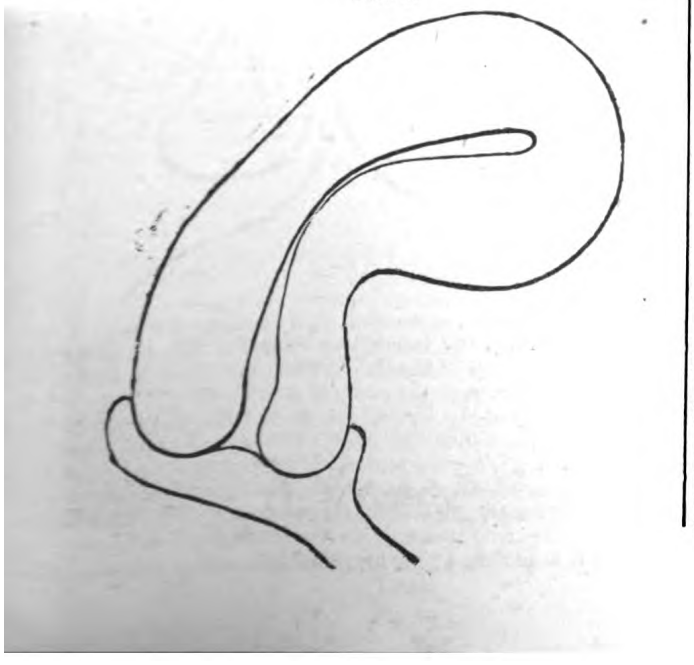
Fig. 3.



uterus, the thickness of the uterine walls and the size of the uterine canal being that usually met with when the organ is in a sound state.

Fig. 4 depicts what may be termed the first stage of

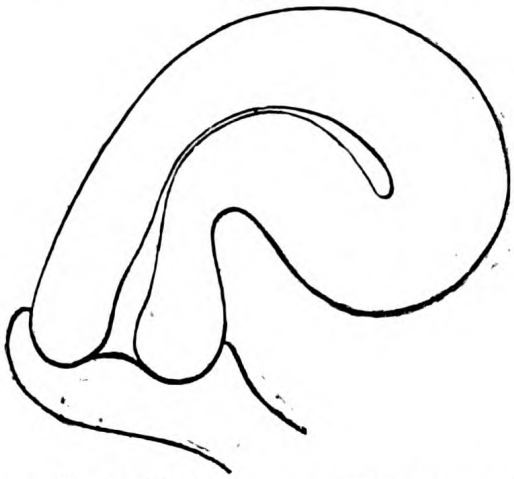
Fig. 4.



anteflexion associated with a slight degree of anteversion. The uterine canal is shown to be somewhat narrowed at and near the position of the internal os uteri by the bend in the organ, the anterior and posterior walls of the canal being thereby brought nearer together. A further change from the normal condition is the slight diminution in the thickness of the anterior wall on the concave side of the flexion. This latter change is not always present, for the uterine wall is, in some rare instances, actually thickened by a bulging forwards of the compressed tissues of the uterus at this situation.

Fig. 5 exhibits a second stage of anteflexion of the

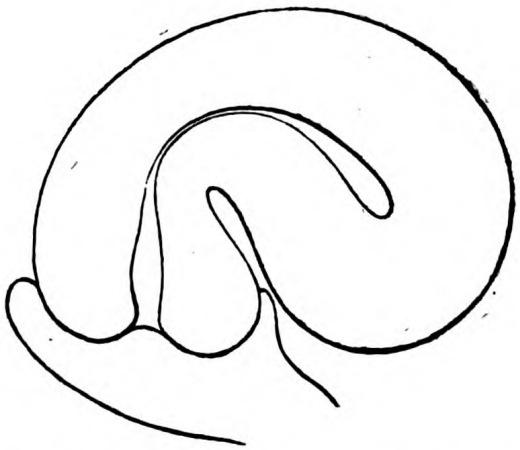
Fig. 5.



uterus. The canal is here more decidedly contracted by the flexion; the anterior uterine wall is also more compressed and thinner. The lips of the os uteri externum are shown to be thicker than usual, owing to the tumefaction of this part of the uterus usually associated with flexion. The aperture of the external os uteri is shown to be more gaping than usual. Such a condition would be generally associated with much congestion and swelling of the body of the uterus also, with, in fact, considerable thickening of the uterine walls superiorly.

Fig. 6 shows an extreme or third stage of anteflexion,

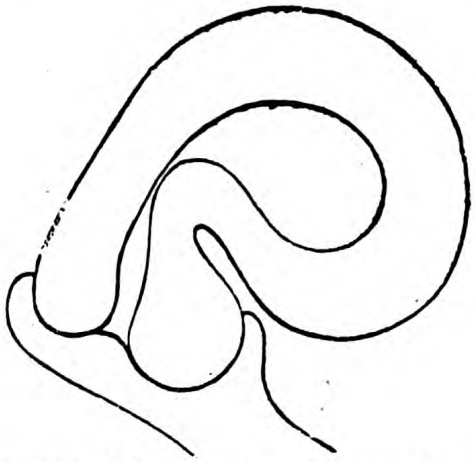
Fig. 6.



the organ being represented as doubled upon itself. The lips of the os uteri are much increased in thickness and its aperture gaping, while the uterine canal at its middle third is exceedingly contracted, and the opposite walls almost touching. They actually do touch, the passage being thus more or less virtually closed under such circumstances. On the concave side of the flexion the uterine wall is very thin. It may become even thinner than this in some cases. The body of the uterus is increased in thickness and size.

Fig. 7 exhibits a severe or third stage of anteflexion associated with considerable distension of the cavity of the body of the uterus. The internal os is very narrow, offering thus an obstacle to escape of uterine contents.

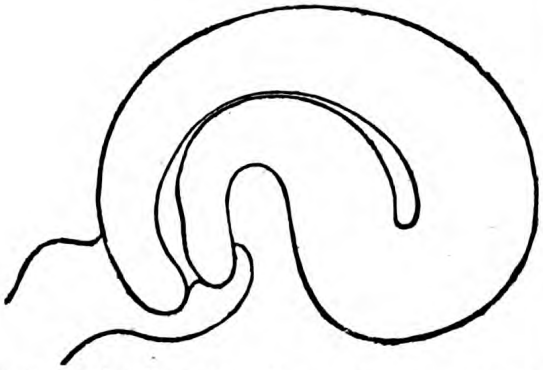
Fig. 7.



The condition of the uterus here shown is such as exists during menstruation in many cases, and which may persist after the period is over. It is also such a condition as may be met with after abortion in cases where abortion has occurred from anteflexion of the uterus.

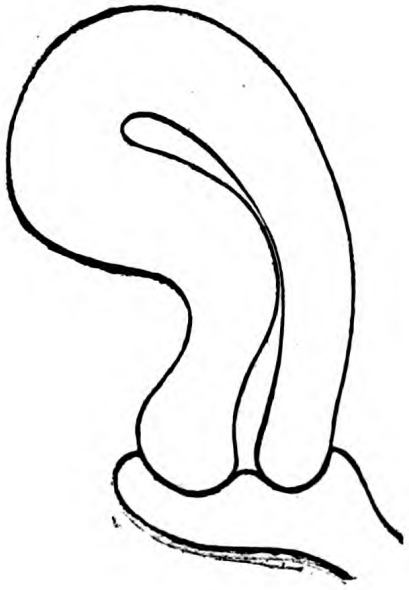
Fig. 8 is a remarkable variety of anteflexion of the

Fig. 8.



uterus occasionally witnessed, consisting in acute anteflexion combined with retroversion of the uterus. The first condition in these cases is anteflexion, which be-

Fig. 9.

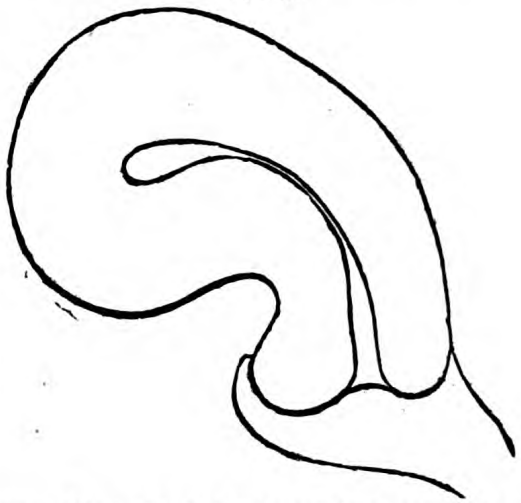


comes acute and perhaps chronic; but subsequently, in consequence of further stress of some kind being put on the uterus, the organ rotates backwards on its central axis and falls into the position here shown. Such cases constitute a class of flexion very troublesome and difficult to cure.

In fig. 9 the uterus is shown in a condition which may be termed the first stage of retroflexion. It is analogous to the first stage of anteflexion, but the fundus is here inclined backwards. The posterior lip of the os uteri is here shown to be swollen and tumid, as is usually the case in instances of retroflexion of the uterus. The uterine canal is here also seen to be narrowed by the existence of the flexion, and to a certain extent occluded.

Fig. 10 shows the second stage of retroflexion of the

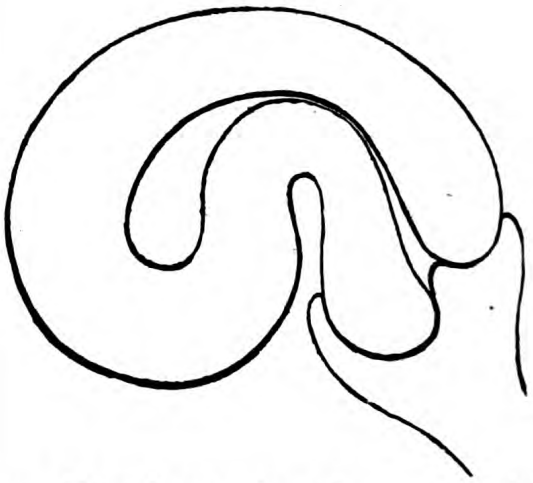
Fig. 10.



uterus. The body of the uterus is heavier, and its walls thicker than normal. There is considerable congestion of all parts of the uterus, both fundus and cervix being larger than usual. The os uteri externum is widely open and the lining of the cervical canal partly everted.

Fig. 11 exhibits the third stage of retroflexion of the

Fig. 11.



uterus with much contraction and compression of the canal at and near the internal os uteri. There is a very dependent position of the fundus uteri; there is also considerable distension of the cavity of the body of the uterus, much swelling of the lips of the os uteri, especially the posterior lip, and much eversion of the cervical canal at the os uteri. This enlargement of the posterior lip of the os uteri is an almost constant accompaniment of the acute stage of severe retroflexion of the uterus. The thickness of the posterior uterine wall on the concave side of the flexion is diminished; the degree of thinning varies much

in different cases. The cavity of the uterus may be, and frequently is, very much more distended and enlarged than is shown in the accompanying figure.

It would be very easy to multiply these illustrations, for each case presents its own peculiarity. Thus, the degree of version is not always in the precise proportion to the flexion represented in the foregoing figures. Again the thickness of the uterine walls varies much in different cases.

(To be continued.)

THE AVOIDANCE OF PAIN. (a)

By GEORGE W. CALLENDER, F.R.S.,
Surgeon to St. Bartholomew's Hospital.

I KNOW of no alloy to the satisfaction a surgeon must feel in being allowed by your favour to preside over this section. His first words should give expression to his thanks for the honour which has been conferred upon him. Such words are mine.

Beyond this, however, it is his privilege to speak to you on the subject which interests us so deeply—the science and the art of surgery. In the age to which this Association has flourished, your President has an advantage over his earlier predecessors in that he can look back upon the work which has been done in connection with this section, and can reckon up many important advances in our knowledge of surgery which have been first made public under the auspices of the Association.

I prefer, for myself, to look forward, and to endeavour, with your permission, to try to interest you in a subject for which you must forgive me if I seem to be in any way too earnest in my pleading, for I do feel respecting it most anxious that it should commend itself to your favourable consideration. From the wideness of its relations, it is, I think, a fitting one to be spoken to by your President, who should, I conceive, always endeavour to put before you matters of broad interest and of general professional concern.

Whilst engaged in the study of the treatment of wounds, one could not but be attracted to many side considerations. To one of these it is that I venture to ask your attention, and in doing so I preface my remarks by this statement.

An operation or an accident wound can be so treated that the patient from first to last shall be free from pain; and in the treatment of many other troubles, a great deal of pain may be avoided by forethought and care on the part of the surgeon.

Next to insuring the life-safety of our patients (and I think we may assert that the mortality after injuries and after operations is not a tithe of what it was, even in comparatively recent years), surely it is something to endeavour to attain to, that we may promise a patient, who can under an anæsthetic pass without suffering through an operation, that he may be sure of convalescing without an ache or a pain from the handling and dressing of his wound, and to feel confident that our promise will be borne out.

Now, what are the causes of pain? Why do patients make the varied complaints which we group together as those of pain? How various are those complaints? I often ask the sick to describe to me the sort of pain from which they are suffering. If we except certain odd and only occasional replies, I find that they adhere to the descriptions which from childhood they have been taught to associate with pain. There is tenderness to the touch, there is the sense of throbbing and of shooting or of darting, and there are dull aching pains, or there are pains likened to some chance experience of the past, a revival of some old association—the pain is like that which attended a cut, or a burn, or the rubbing of a blistered surface.

But it is not pain alone, that is, in the ordinary acceptation of the word, with which we have to deal, and it is not the patient's description of his kind of pain which is of importance. It is the cause of his discomfort, or of his pain, to which attention must be directed if we are to learn how to prevent them by obviating the conditions out of which such troubles arise.

I say it is not pain alone. There are various sensations, not strictly of a painful nature, and yet causing restlessness, and hence causing pain. Such are the impressions after an amputation, which make the patient fancy that the hand or the foot cut off still remains part of his body, or still needs to be steadied by muscular action. As he dwells upon the sensation, or as the muscles assume their accustomed vigilance, the muscles which lie in the wound, and with which foot or hand movements are usually made, are apt to fidget and grow irritable; then they cramp or jerk, and prevent rest, and so interfere with the process of repair. But this local condition begets general restlessness, and this is added to the muscular trouble, which latter may induce what is termed jumping of the parts concerned in the wound, especially when the patient is falling off to sleep, so violent may be the muscular contractions and loosenings.

This trouble arises from education, and from oversight in the treatment of a wound.

From education if, for some time prior to the amputation the muscles have been trained to keep a joint, such as the knee or ankle, in a state of rest. During such training the muscles relax from the state of contraction when sleep begins, and then follows that jerking of the limb, causing pain in the jarred joint, and so arousing from sleep, which is so well known to surgeons as one of the distressing symptoms attending joint-diseases. It may be obviated by the use of weights so applied as to steady, under slight extension, the affected part irrespective of muscular action. If it have not been so obviated, the training to which the muscles have been subjected will live in the stump, and the result will be that the muscular relaxation at the oncoming of sleep will shake the wound, and cause severe pain, unless, indeed, the stump have been so supported as to rest easily and equally in its bearings, and free to swing with the chance movements of the body.

In cases in which this trouble, the starting of a limb, has been strongly marked before an operation, as it often is, more especially with disease of the knee-joint, I recommend that the nerves exposed on the face of the stump should be stretched so as to numb, and, for a time, to quiet, the muscles supplied by them, or by nerves in association with them through a common plexus of origin; and if, in addition, the stump be properly secured and swung, the pain and unrest which might otherwise have followed the operation from the starting of muscles will be effectually prevented.

From some oversight in the treatment of the wound. There is an essay by an old French surgeon, M. Pouteau, in which he treats of the dislocations of muscles, and the discomfort and restlessness caused by their being displaced from their natural relations. Now, for the comfort of a patient, we should always be sure that the parts of a wound are, so far as may be possible, in their natural positions; for instance, that the relations of tendons are normal, or, taking the face of a stump as an illustration, we should be certain, before the wound is closed, that the several muscles and tendons, in the thigh or forearm for example, are in their proper relations one to another. If they be not, if they be dislocated, they will lie in unrest, and the patient will feel the discomfort due to their displacement. The discomfort may not be great, but it is one the cause of which is easily avoided. If, again, muscles have been long fixed in one position, and if an operation have to be performed, if possible (it may not always be feasible) we should place the parts so that they may rest after the operation with the muscles in the position to which they have been tutored. If we do not, the muscles, with cramp, or in trembling, will show how ill they bear their altered relations, and again a sense of

(a) An Address delivered in the Section of Surgery at Bath.

pain and discomfort is established ; and to this I may add that, when we can, it is as well, before operating, to train parts for a position which may be needed after an operation ; not only do we thus accustom the patient to an unusual and perhaps irksome position, but we may learn that certain positions are individually unbearable, and we have then to devise others in their stead. We cannot have a better illustration of the good of this training than in an instance to which I have often referred, the making a child wear some bands of strapping over the lip and cheeks before operating for a hare-lip. He does not resist and fret over the dressings which are needed after the operation, having been broken in to their use. It is a rule with me never to saw through a knee-joint for genu valgum, to amputate a limb, or, in a word, to perform any operation which involves subsequent confinement by splints or an unusual position without, whenever it is practicable, training the patient as suggested, in order to accustom him to the restraints.

When practicable, a wounded part should be suspended and balanced so as to lie at rest independently of all chance movements of the body. The muscles otherwise would be on guard to protect the injured structures from such movements. The protection is at best imperfect ; but Nature at once recognises the help given by an evenly-balanced support, and the muscles lie inactive and free from liability to start. I am sure that, if these details be attended to, we shall never have our patients complaining of the discomforts which are due to muscular restlessness.

There are, however, yet other conditions dependent upon muscles which require attention, and I may refer to these under the head of orderly and of disorderly actions.

One illustration of either will suffice. After the removal of a tumour of the breast the wound is, of course, influenced by the orderly movements of respiration. If we leave the wound comparatively free all moves together ; but if we over-tightly compress and bandage the parts the skin will cling to the dressings, whilst the deep surface follows the movements of respiration. A state of unrest is established between the two surfaces, which is an obstacle to success and a cause of pain. This is orderly action.

If, on the other hand, we attempt to change the dressings of an amputation of the thigh, we find that the muscles will start and jerk the moment the dressings are disturbed, and with the jerk not only is there pain, but parts just united are liable to be sundered. This is disorderly action. So we learn never to attempt such a change of dressing without fixing the limb by suitable appliances, so as to give to the part that sense of steadiness which prevents the starting of muscles. It may, however, be necessary, in dressing a wound, to put in action certain muscles which are then apt to move spasmodically, causing great suffering by their disturbance of a wound. How this may be avoided I will mention when referring to the treatment of breast-amputations.

Let us next consider two common causes of unrest and of pain, viz.: first, tension of wounds ; and, secondly, distension of wounds. We often hear complaints from patients of tightness about a part, and one is surprised to find how slight a change in the bearings of a dressing will often give relief. After a fracture, say of the tibia, has been put up, the sense of discomfort is often promptly arrested by cutting with scissors the edge of the bandages to a trifling extent ; or if the patient complain of discomfort about the ankle, we do not slacken the side splints, but we tighten the strap which secures the side-splints just below the knee, and thus and at once the strain is taken off the lower end of the limb and the patient is relieved.

I am in the habit, when it has been necessary to use bandages or strapping for the security of a first dressing, of always dividing some twelve hours later the confining bands, without otherwise disturbing the appliances. No better example of the relief thus afforded can be had than after an ordinary operation for strangulated hernia. It is quite needless, it is true, to apply any firm compress or tight bandage after any such operation, but suppose that a piece of carbolised lint is laid over the wound, protected by gutta-percha tissue, and that a turn of a bandage round the hip and upper part of the thigh secures this, a certain amount of swelling, which, so far as my experience goes, always follows an operation, ensues. The bandage over the abdomen is cut, at once the ends separate an inch or more, and the patient gives expression to a sense of relief ; a piece of strapping bridges across from one portion of the divided bandage to the other, making the dressing again secure, whilst the distension, which was beginning to cause uneasiness, and which might have occasioned restlessness and sleeplessness, is no longer a source of trouble.

Another cause of uneasiness is the condition arising from the collection of fluid in a wound—distension—in contradistinction to that general infiltration of a part which gives rise to what I have termed "tension" simply. Often, in visiting a patient some hours after an operation, I used to find him restless and complaining of pain about the wound. On examining it, there would be tenderness, and perhaps a little redness about its margins. If a probe were introduced, a few drops of blood-stained serum would well up by its side, and would continue to ooze into the dressing along the track thus made for it. Then, and immediately, the tenderness and the blush are dissipated, and the patient is at ease. It is in this one sees the beginning of a trouble which, in my experience of the past, hardly ever received attention in this its earliest stage ; but which was the commencement, at least, of great constitutional disturbance, was the first step in the occurrence of diffused local inflammation, and, in my opinion, by the directly poisonous action of the serous fluid when simply reabsorbed, was the cause of much of that blood-poisoning which was formerly often the cause of death after surgical operations, but which is now known to be a preventable complication. It was a knowledge of the liability to trouble from this source which led surgeons to leave wounds of depth freely open, and thus to lose the advantages of primary union. It is, I consider, amongst the most important factors in the successful treatment of a wound, that distension from accumulation of fluid should be prevented by well-devised drainage, and by the use of this, an important cause of pain and of restlessness has been eliminated.

But, if the greater distension from fluid collecting in a wound be prevented, there is another lesser unrest of the parts, due to the swelling of the edges of the wound, when these are brought into contact by sutures which are thus tightened, and this discomfort is increased if any strain is borne by the sutures which join these edges. Under such circumstances, there soon arises irritation about the line of should-be union, and primary adhesion is imperilled. This has induced us to use, when such strain may be looked for, what I term "main stays," that is sutures carried deeply through the wound from a considerable distance on each side, so arranged as to bring its edges together to a great extent, and yet, whilst relieving tension of the lesser stays or ordinary sutures which join the edges of the wound, placed so far away that the irritation, if any, where they press on the skin, can have no influence on the repair of the actual margins of the wound. Here, again, in a small matter of detail, discomfort will be avoided by escapement from irritation from the sutures which are used for closing a wound.

It will, I think, be obvious that union of a wound cannot take place unless the parts to be united are kept at rest ; and the first and least considered cause of unrest, and with this invariably goes pain, is the swelling of the injured structures and the collection of fluid within a wound, either of which conditions causes disturbance of the parts which should unite ; the latter by actual separation of surfaces, and either, by the tightness it occasions, gives rise to pain—pain which may be, and which ought to be, guarded against by the simple provisions which have been named.

Another and better known cause of pain is that which comes from what may be termed coarse handling of a

wound. When I recall the manner in which, for instance, the wound after an amputation was formerly handled, the pain, and the dread of the pain associated with its dressing, I cannot but feel strongly in stating that all and every dressing after an amputation may be, and ought to be, conducted without causing the patient the slightest hurt—ought to be, not merely for the avoidance of pain, if that alone were not reason enough, but to insure that perfect rest without which rapid repair of the injury is impossible; in a word, every wound should be kept as immovable as we have long known that a broken bone must be, if its union is to be insured.

In pleading, then, for the avoidance of pain, let me detain you whilst I briefly refer to the management of two very ordinary cases, an amputation of the breast and an amputation of the leg; and let me premise that it is necessary to scheme and to prepare beforehand all the dressings you will require. These dressings must insure support, and rest, and ease.

And here let me mention, if, in dressing a large surface, as after the separation of sloughs after a burn, or when a considerable portion of skin has been of necessity sacrificed in an operation, we find there is much pain complained of in each changing of the dressing, examine the surface carefully, and we shall mostly find there are certain parts painful, and others not so. The painful points are the spots where nerves are lying exposed on the surface; and if such spots be protected with a small piece of isinglass or gutta-percha tissue, all other parts of the wound may be dressed without any hurt to the patient; and this is a means of relief from pain so often coming under our notice, that it is only necessary to mention it to claim for it attention.

Now, take a wound left after amputation of the breast, and let care have been given to staunch all bleeding, and let the line of incision have been so arranged as to leave an end of the wound in a dependent position. The wound may be drained by the insertion of a tube, say of perforated india-rubber, along its entire length, one end being left projecting at the dependent point. I say nothing about the carbolising of the wound, as I am now dealing rather with the treatment so far as pain avoidance is concerned. Then bring the wound together by means of main stays. Then close its edges with silver sutures, from which, as the wound swells, tension will be largely taken by the main stays we have introduced. Apply the dressings, not too tightly, or the movements of respiration will make the costal surface of the wound rub upon the more superficial; and then place the forearm and hand across the chest, and secure them against sudden starts by a bandage lightly passed from the wrist round the neck, supporting the elbow, and to the wrist again. Seven or eight hours later, cut through the strapping with which you will find it the more simple plan to have secured the dressings, and, with a sense of relief to the patient, they will separate an inch or more; a strip of plaster will reunite them, and, whenever the wound has to be dressed, this strip should be cut through and a new one placed over it, the originally applied plaster never being removed, because, especially if from a hairy surface, its removal is attended with much discomfort. When the wound has to be dressed, slip the bandage from the wrist, and then grasp the arm above the elbow firmly in one hand, and with the other move the hand and forearm to a straight line with the arm; then, still grasping the arm, move it out from the side so far as you may think fit. By this guarded movement, you will prevent the sudden and involuntary contraction of the biceps and of other muscles, which, if the arm be not steadied, will assuredly occur, and will be followed by a corresponding jerk in the pectorals, disturbing the wound and causing the patient to cry out with pain. The dressing is then removed and renewed, and, using as I do carbolised oil on lint, protected by gutta-percha tissue, this part of the operation is most simple. See that the draining-tube is acting properly, and renew some tenax in the axilla, or a small sawdust pad, to catch the discharging serum, if any, and then carefully replace the arm and then the forearm to its original position. Tended in this way, we are certain of conducting our case without an ache or a pain, so far as the dressing of the wound is concerned.

I have already referred to the dressing of amputation-wounds, and this model will show the plan, which I described in several of its details before the Association some years ago. The limb is steadied by being secured on a back splint; it is allowed to swing easily whilst so secured, and, by the dropping of the end of the splint, the dressings can be renewed without pain—without, indeed, the patient's knowledge. But, to show how nicely the details have to be arranged, it may be added that the least roughness in handling, causing but a slight jolt of the apparatus, will be followed by a cry of pain, reminding us of the ease with which may be produced the suffering we study to avoid.

I do not speak of the use of opium in its varied forms. My contention is that pain is to be avoided; and, therefore, it is no part of my present purpose to refer to its being masked. Yet, I would add that, as want of sleep begets restlessness and discomfort, it is always well to guard against such trouble by making sure that, after an operation, there shall be good sleep—it matters not at what time of the day, for it is often undesirable to wait for night before giving the sedative. It is, therefore, a rule with me always to give morphia (injected beneath the skin, so as not to disturb the stomach after the anæsthetic) after every operation on adults, and sometimes after those on children.

But I must detain you no longer than is necessary to ask your indulgence for having spoken to you on this detail. Our work is the culture of practical surgery. It is well, no doubt, to inquire into the pathology of disease, and to discuss remote questions of cause; interesting and sometimes important results flow from such inquiries. But, face to face with the practice of our art, it is the question of treatment which forces itself to the front. I have sought to speak to you as from the bedside of the patient: and I venture to hope that we may count it as a practical gain if, by careful attention to the details I have mentioned, we can take from operative surgery that dread with which it is so commonly associated—the dread of pain.

Ovariotomy.—Recovery.

Under the care of Mr. Thomas Laffan.

M. H., æt. 35, servant, married, came under my care October, 1875. She looked thin and worn. She stated that on the previous May she began to lose health and look badly. She vomited regularly before eating; and had periodic pains in the abdomen, her left leg swelled a little, her appetite and sleep were good; the menses were normal. She attributed her condition at first to pregnancy, but afterwards to cold and hardship. These symptoms continued until August, 1874, when she became pregnant. From that date she noticed no change in them until May, 1875, when she was delivered after a natural labour of a healthy male infant. The women about her then noticed that she seemed as large as ever. The left leg and thigh became very much swollen a month after this, and remained so for nearly two months, when the swelling all but disappeared. The symptoms already described persisting, she placed herself under my care as above detailed. Her previous health had been good. Her family too, with one exception, seemed to be healthy. The one exception was that of a brother, of about the same age, who had been under my own care for spinal abscess, caused by a fall from a scaffold in America. This man had a very scrofulous appearance,

and from that fact I inferred that there was some tinge of that diathesis in the family.

The patient had the appearance on admission of a half-starved person far advanced in pregnancy. The skin and extremities presented nothing peculiar. She slept naturally; she complained of a slight occasional headache; sight and hearing were perfect. Her intelligence and temper presented nothing peculiar. The heart and lungs were sound; there were, however, some slight traces of bronchitis. The pulse was normal, as were also the respiration and temperature. The tongue was natural, the appetite and digestion good, and the bowels regular. The abdomen was immensely increased in size, its walls were not œdematous. There was no retraction of them at any point; the umbilicus was depressed. It preserved its normal relation to the ensiform cartilage and pubis, but was slightly nearer to the right than to the left iliac spine. The abdominal walls were not so tense but that they allowed of a certain amount of compression. No crackling or friction could be felt or heard, nor could the outline of any tumour be either felt or seen. On percussion the abdomen was universally dull, and this was not affected by change of posture. Thus, on making the patient lie on the left side, and compressing the right lumbar region with one open palm, while the fingers of the other hand were used as a percussor, a dull sound was still elicited; while at the same moment if the opposite flank was also percussed, the patient being placed well out on the edge of the bed, a similar result was obtained. When the patient was made to lie upon the right side, the left flank being superior, the respective percussion tones remained unchanged. There was, therefore, entirely wanting the help which percussion usually affords to differentiate between ascites and ovarian dropsy. Examination per rectum and vagina afforded no assistance beyond showing that the uterus was healthy. The urine was of normal quantity, sp. g., and composition; and there never had been any history of urinary troubles. She had never vomited blood nor voided it per anum. She never had had jaundice. There was no enlargement of the spleen. One extremity only had at any time been œdematous. The area of hepatic dulness superiorly was normal. There was no history of intemperance. Hæmorrhage, œdema, and jaundice, are not present in every case of liver disease, but absence of all them together is so rare, as to raise strong presumption against its existence. Enlargement of the spleen should be very great and very palpable to produce so great a dropsy. The state of the urine was opposed, yet not conclusively, to the idea of a renal cyst. Two or three cases have been reported where this secretion was healthy in every respect, and yet where one kidney was extensively diseased. In making a diagnosis, however, one is entitled to discard rare exceptions, and I felt that whatever else it might be, it was not renal disease. After carefully considering all the bearings of the case, it seemed to me that the question narrowed itself between peritoneal disease and ovarian tumour. Sharp pain there had been, universal dulness there was.

Cases have been published in which diagnosis between the two being found impracticable, the patients were placed upon the table and actually operated on for ovarian disease where nothing but peritonitis existed. It was, and is still, laid down that in a case like this certitude in diagnosis is not possible. The pulse and temperature were both against peritonitis. The healthiness of the chest, the duration of the disease, the absence of traumatic history, and the bulk of the abdomen, were likewise against it. There was also against it the fact of the absence of all tenderness on pressure in the abdomen. I resolved to tap the patient, as an additional means of helping me to arrive at some positive conclusion. Accordingly I did so some days after admission, and withdrew a large quantity of brownish fluid, quite different from that found either in ascites from organic disease, or as the result of peritonitis. I did not subject this fluid either to the test for paralbumen or to microscopical examination, for those cells which Bennett of Edinburgh and the American Drysdale have described, as peculiar to ovarian disease. I understood that neither afforded any reliable aid to diagnosis. I perceive, however, that Dr. Wells speaks somewhat more respectfully in his lectures (just publishing) of microscopical helps.

After removing the fluid it occurred to me that if a silver sound were passed through the trocar opening into the cyst, the uterus being fixed through its cervix, a comparison of the spaces through which the sound would move when the uterus would be so fixed, and when it would be free, would throw light on the subject. Furthermore, I thought the position of the dulness which would remain after the withdrawal of the fluid, would in itself tell something. Consequently, when the abdomen was quite emptied of the fluid, I proceeded at once to employ the two aids I have mentioned. On percussion a large central circle was now found to be dull, and all the remaining portions of the abdominal wall were quite natural. This disposed of, the idea that I had to deal with any hepatic or splenic affection, I next used a large curved sound, and when the uterus was unfixed, this found its way at one moment to the very limit of the left hypochondrium, and at another to the right iliac fossa. When, however, the uterus was fixed, not more than half the space could be traversed by the sound, showing clearly that some cavity in close connection with the uterus, and not that of the entire peritoneum, defined its movements. When the sound seemed to traverse the entire abdominal cavity at the first trial, I thought I had to deal beyond all doubt with a case of peritoneal effusion, but I recollected that the mobility of an ovarian pedicle would fully explain the freedom of movement.

The curtailment of the limits through which the sound could traverse the cavity when the uterus was fixed, satisfactorily proved that a circumscribed cavity had to be dealt with, and also one whose mobility was not reconcilable with the fixedness which we must consider as the the inseparable attendant on a circumscribed collection of peritoneal fluid. I came to the conclusion then that I had to deal with ovarian disease. I resolved to wait, however, and see if this case might prove to be one of those exceptional ones in which tapping effects a cure. Patient recovered without any bad effects from the tapping, and she soon after left for home. The cyst, however, after some time filled again, and she returned in February, 1876. I again tapped her, withdrawing this time two and a-half gallons of like fluid. This quantity was somewhat larger than that withdrawn before. She soon after again left in order to make arrangements to return for an operation. I did not again see her until the 31st January in this year. Her condition was in no material respect different from that which she presented on her first admission. The various symptoms and signs already detailed remained unaltered.

She was placed under the preliminary treatment laid down by Mr. Wells, in his monograph, and after her general condition had been somewhat improved, arrangements were made for the operation. A spacious ward, from which all patients were for some weeks removed, situate in the open country, was fitted up for her exclusive reception. The Sisters were indefatigable in seeing that every comfort and convenience was placed at the patient's disposal. The temperature was regulated by a thermometer. Muslin bags of disinfectants were hung on cords through the room, and all the directions prescribed by Mr. Wells were carried out to the letter. On the 1st of March I proceeded to operate. Drs. Molony, Hourigan, Heffernan, and O'Dwyer, assisted.

Bichloride of methyline was selected as the anæsthetic. This was administered by Dr. Hourigan. The various steps of the operation itself were carried out after the usual method. Their enumeration here, therefore, is not called for. The pedicle was secured by a clamp, and during the entire procedure, a shower of thymol spray was constantly maintained over the wound by means of Fletcher's apparatus, which was efficiently worked by

Dr. O'Dwyer. I should not omit to state that so little distinction was there between the uterus and pedicle, both in colour, feel, &c., that it required a careful examination before the clamp would be safely affixed. Should any little difficulty of the kind occur again, I would slip the finger through the trocar-opening of the empty cyst, and thus accurately determine the limits of the tumour. The *toilette du peritoirie* was very carefully conducted, and no portion of the abdominal cavity into which a drop of fluid might have found its way was left unvisited either by sponges held in the hand, or by others attached to long rods. Very little blood was lost. The anæsthetic reduced the pulse at one time to the small number of twelve beats; still nothing could have been more satisfactory than the anæsthesia produced. The operation completed, and consciousness restored; the patient was after a brief interval removed to bed. She rallied very soon, and got on admirably during the remainder of that evening. That night she slept badly. Temp. 101°; pulse 130; no pain, no rigors. Took drinks which were given at regular intervals in very small quantities. Urine withdrawn by catheter from time to time.

2nd.—Vomited twice, no pain, no rigor. Took drinks. Slept a few hours. Temp. 99°; pulse 130.

3rd.—Temp. morning, 99°; pulse 140. Temp. evening, 99°; vomited several times; no pain, no rigor. Took her drinks. Slept none.

4th.—Vomited four times. Slept a little. Temp. morning, 98°; evening, 100; pulse 120; still free from pain or rigor.

5th.—Temp. morning, 98°; evening, 97°; pulse 112. Slept a little by means of morphia; vomited less, complained of a little pain in the abdomen. A profuse discharge now set in from wound.

6th.—Temp. morning, 96 4-5ths°; evening, 91°; pulse 108. Vomited less, discharge from wound considerable. A hardness was now felt in left iliac fossa.

Slept during the night, but after morphia, and continued to take her drinks.

7th.—Slept well, vomited only once, after which it entirely ceased. Took her drinks, had one move in bowels. Discharge now became purulent. Temp. morning, 99°, evening, 99 4-5ths°; pulse 120.

8th.—Slept. Had no vomit. Had one motion of bowels. Temp. morning, 98°; pulse 116. Evening, pulse, 128; temp. evening, 99°.

9th.—Temp. morning, 99°; pulse 132. Evening, temp. 100; pulse 136. State of patient in other respects unchanged.

10th.—Temp. morning, 98 1-5th°; pulse 116. Temp. evening, 99°; pulse 112; other matters as before.

11th.—Slept well. Looked flushed. Temp. morning, 99°; pulse 124. Bowels moved twice.

12th.—Slept well. Temp. morning, 100 4-5ths°; pulse 120. Some signs of pneumonia now presented themselves in left lung. Great discharge from wound. Great hardness in iliac fossa. Thirst considerable.

13th.—Pneumonia as on yesterday, discharge from wound less. Temp. morning, 99 3-5ths°; pulse 128. Pulse, evening, 136; temp. evening, 99 1-5th°.

14th.—Temp. morning, 99°; pulse 108. Lung signs better.

15th.—Improvement still more manifest.

16th.—Temp. morning, 99°; pulse 120. Sat up to day in bed for the first time.

17th.—Slept well as before. Temp. morning, 99°; pulse 116; temp. evening, 99°. The discharge from the wound had during the last few days become much lessened, and the wound itself showed signs of healing up. From this day forward, the patient convalesced rapidly. The discharge from the wound grew daily less, and finally ceased. Its margins united, or were joined together by new tissue. Her strength and appetite returned, while the pulse and temperature became natural, and all the bodily functions were well performed. Some pneumonia signs, indeed, there were for some weeks, but those disappeared in due time, and towards the end of April, the patient was restored to perfect health. I, however, kept her in hospital until the 1st of June, as her circumstances were poor, and I dreaded to expose her too soon to the perils of a cheerless home. A minute detail of her treatment seems scarcely necessary here. Suffice it, that symptoms were met as they arose, and that every aid that good air and good nursing could afford, was at the disposal of the patient. The stomach sickness, freedom from peritonitis, secondary pneumonia, and free suppuration from stump antiseptics, notwithstanding constitute the principal points for noting in the after history of the case. The difficulties which surrounded the diagnosis are interesting. I have some reason to believe that these difficulties are not entirely exceptional, and that in consequence, the disease is not always recognised.

In conclusion, I desire to take occasion to thank a former valued teacher, the eminent Dublin surgeon, Mr. Hayes, for many valuable suggestions received during the progress of the case.

Special Reports.

THE PROPHYLAXIS OF INFECTIOUS AND CONTAGIOUS DISEASE.

ABSTRACT OF A REPORT ON THE TRANSMISSIBLE DISEASES, WHICH REQUIRE ISOLATION, EITHER IN GENERAL OR SPECIAL HOSPITALS, AND ON THE MEANS OF RECONCILING THIS ISOLATION WITH THE CONDITIONS AND REQUIREMENTS OF HOSPITAL ADMINISTRATION.

Made in the name of a Commission composed of

MM. FAUVEL, LEGOUEST, LEON COLIN, LE ROY DE MERICOURT, MARIE DAVY, MICHEL MORING, PINARD, ROCHARD, TARNIER, VALLIN, VIDAL, VIOLET LE DUC,

By MM. FAUVEL, AND VALLIN.

(*Continued from page* 147.)

II.—ISOLATION OUTSIDE GENERAL HOSPITALS.

A. — *Special Hospitals for One Transmissible Disease.* The grouping of patients suffering from the same form of disease in an hospital exclusively devoted to that disease is, if not the most perfect, at least the most complete method of isolation. Its advantages are numerous. It secures the patient from contracting another disease, and this is particularly important for children. It also affords facilities for the selection of an efficient staff.

Each disease requires special arrangements, and what may suit one may be injurious in the treatment of another. As for instance free, continuous, natural ventilation is advantageous in small-pox and typhoid, whilst it might be contra-indicated in measles or scarlatina. As regards the objections, it is alleged the system is too costly. The question is a debatable one between physicians and the administrators of charities; the former, in the name of hygiene, ask for small hospitals scattered in the peripheric quarters of a town. The latter allege that these hospitals are too expensive. With the present system special hospitals for one disease labour under the difficulty of the transport of the patients from one end of the town to another. The importance of this objection may be exaggerated. The diseases are few in which the length of transport may be a source of danger. We shall, subsequently, consider the arrangements for aid to contagious patients in urgent circumstances. In large capitals, as Paris and London, owing to the annual number of cases, several hospitals will be required for the same disease: thus London possesses five or six hospitals devoted exclusively to small-pox.

This mode of isolation appears to have been applied only to a limited number of diseases—as small-pox, puerperal diseases, petechial typhus, and, in times of an epidemic, to cholera.

B.—*Hospitals receiving several Transmissible Affections.* During the last five years this method of isolation has been imitated, after the custom in Great Britain.

We may briefly describe the system:—

The endemicity and gravity of petechial typhus in Ireland, Scotland, and later in England, the long epidemic of typhus

in London, led to the establishment of a number of institutions, called "fever" hospitals; besides typhus and typhoid fever, other infectious diseases, as measles, scarlatina, and diphtheria being admitted. The old London Fever Hospital, reserved since 1871 for paying patients, has been replaced by two establishments under the Metropolitan District Asylums Board. The Homerton and Stockwell fever hospitals each containing 200 beds. They are built on the pavilion plan in four blocks of two *éloges*, one being devoted to typhus, another to typhoid, another to scarlatina. But two pavilions may be devoted to the same affection, as was done in 1875 and 1876, at Stockwell Fever Hospital, when 625 cases of scarlatina were admitted and only 21 of typhus. At Birmingham, Glasgow, and Manchester, hospitals of a similar class exist.

At Copenhagen there is the hospital of Blegdam of 168 beds, exclusively reserved for transmissible affections, and near Berlin the hospital of Moabit.

Finally, at Birkenhead, Sunderland, Cheltenham, are small comfortable fever hospitals reserved for patients belonging to the middle classes.

This incomplete enumeration shows, that at present, there are elements furnished by experience, and which may be further supplemented.

The advantages of the system we shall briefly notice—

1st. General hospitals are those relieved from all transmissible affections.

2nd. It seems natural to unite in one hospital different affections requiring the same precautions and the same care.

They should be built at a distance from populous streets and private abodes.

The style of architecture should be pavilions on the English block-system.

The materials should be impermeable to miasmata, easy of disinfection—ventilation and heating should be on the most perfect system.

Such an hospital requires rigorous and distinct rules different from those applicable to ordinary hospitals, whilst the staff of nurses must be selected from those who have had the disease under treatment.

Discipline must be strictly maintained, to regulate the leave of absence to the infirmarians, and the visits of friends to the sick. The disinfection of bedding, clothing, linen, requires special apparatus and care in all transmissible affections. It is easy in an institution devoted specially to these affections to render this complete and thorough. In the hospitals we have mentioned the most scrupulous attention is devoted to this duty, and hence doubtless the propagation to the convalescent of a new disease is prevented.

In small towns there is not much difficulty as to the transport of the patient. In large towns several special hospitals are required.

It seems, however, that two fever hospitals are sufficient for London, which consists of a scattered population of no less than three millions. The two hospital systems we have just described are combined in a very happy manner in London.

Two small-pox hospitals are annexed to the Homerton and Stockwell Fever Hospitals. The two hospitals are distinct and under different administration. But they may be connected for a moment by the opening of a grille which is habitually closed. Thus in the month of December, 1876, the Homerton Small-pox Hospital had under treatment 144 variolous patients. No more beds were at their disposal. The other hospitals were filled. The grille was opened, and the Homerton Fever Hospital was converted into a provisory for small-pox.

The pavilions were emptied of their patients and disinfected. Disinfection was so complete that not a single case of typhus developed amongst the 857 variolous patients introduced during the quarter into the wards thus transformed.

In a similar manner during the epidemic of scarlatina the small-pox hospital was used. This combination offers indisputable advantages. It is a powerful resource in epidemics of one disease. Thus in London, in 1875, the number of admissions for scarlatina reached 1,191, whilst during the year the admissions for small-pox fell to 101. During three months the small-pox wards were completely empty, the hospitals thus coupled lent reciprocal aid.

Amongst the objections is the repugnance to the establishment of such hospitals by the inhabitants of the neighbourhood, as instanced in the case of Homerton and Hampstead hospitals. This objection may be easily surmounted; but there is another more serious. This system required the construction of new hospitals built on an approved plan, for it is difficult to utilize existing hospitals, too rarely established on the type of small separated pavilions. The expense is the great obstacle to the establishment of a regular system of nosocomial isolation.

III.—Isolation inside General Hospitals.

An isolated hospital may be connected with a large hospital and devoted to the treatment of other diseases, and there may be a pavilion preserving in a certain measure its autonomy.

The most perfect type of this kind is the new hospital for children at St. Petersburg, where there are isolated pavilions for diphtheria, small-pox, scarlatina, measles, and isolated wards for syphilis, purulent ophthalmia, whooping-cough, typhus. Generally there is a single pavilion completely isolated, as at the Children's Hospital, Great Ormond Street, London, the new Norwich Infirmary, the Hospital Menilmontant and St. Eugenie. This system is recommended for the facility with which it may be adapted to most existing hospitals. In all hospitals possessing large grounds it is easy to erect slight buildings made of brick, of iron frame work, or sheds, which may be burnt. This mode has also the advantage of assisting medical instruction by multiplying the special wards without notably increasing the *personnel* of direction and administration.

On the other hand, it cannot be denied, it affords incomplete security in certain highly transmissible diseases. It admits the enemy, and propagation is possible by the infirmarians, the bedding, clothing, by visits to the convalescents.

With certain strict precautions this system may be adopted. But even with these precautions internal causes, although rare, are not always avoided.

In conclusion, the various methods of isolation may be arranged in a decreasing order.

1st. The method of isolation nearest perfection is that obtained by means of a hospital devoted to one disease, or to several diseases treated in pavilions independent of one another. It is also the most costly and the most difficult to organise.

2nd. A separate pavilion in a general hospital affords sufficient, but still less security.

3rd. Special services without communication with the rest of the building in which they are placed are a precarious resort.

4th. Isolation in reserved wards attached to general services is illusory.

The most perfect method should always be preferred if it was not, at the same time, the most costly and the most difficult to put in practice. We must, then, proportion the severity of isolation to the danger of contagion.

What is true for the adult is not always so for the child; what is sufficient for one disease is insufficient for another; still more, a disease the transmissibility of which at ordinary times is limited acquires in an epidemic a power of propagation requiring the most vigorous preventive measures.

It is, then, necessary to pass in review each transmissible disease separately, and to study *seriatim* the methods of isolation each one requires.

The Use of Thymol in Surgery.

A lecture on this subject has been published in Volkmann's series, by H. Rinke, of Halle. The solution used instead of the 3 per cent. solution of carbolic acid, consists of one part thymol, ten parts of alcohol, twenty of glycerine, and a thousand of water, and can be employed as either a spray or a solution. An impregnated gauze is also used. Since thymol does not irritate the wounds, the gauze may be laid directly upon; otherwise the same method is employed as in Lister's plan. If the gauze becomes hard and dry, it may be moistened once or twice a day with thymol water. In order to prevent the evaporation of the thymol from the dressing, the gauze is covered with oiled paper. From an experience of forty-one wounds dressed with thymol, the lecturer concluded that the method leaves nothing to be desired as to its antiseptic effect, and that it answers better than the carbolic acid dressing, since the secretion from the wounds is less, the period of healing shorter, and the cost of the dressings is smaller. Further, it has no poisonous properties, and eczema was never observed in its use.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
published every Wednesday morning. Price 5d. Post free,

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 28, 1878.

DR. MACLAGAN ON THE STUDY OF FORENSIC MEDICINE.

WITHIN the last two years we have more than once expressed our surprise that forensic medicine does not receive from the profession the attention it deserves, and we have shown that this science is not only much neglected by the students, but is almost practically ignored by some of our examining boards. It was, therefore, with some pleasure that we read Dr. Maclagan's address, delivered at the late meeting of the British Medical Association, the first part of which is devoted to the consideration of the claims which forensic medicine has upon all medical men who, either engaged in any medico-legal investigation, or placed in the witness-box, would wish to uphold the dignity, learning, and usefulness of the profession to which they belong.

"What," asks Dr. Maclagan, "is to be said of the appreciation of forensic medicine by our own profession? I fear that it sometimes has rather the cold shoulder turned to it. I fear that many of our students think it a matter of little or no importance, and many teachers do nothing to disabuse them on this point." It does not follow that, because forensic medicine is not a special science, it should not receive special consideration. Medical questions assume a very different aspect when viewed in the glare of a court of justice from what they do in the mild light of the hospital or the sick room. A man may be a very successful practitioner, and yet a bad witness; and very much mistaken is he who thinks that on the score of his general knowledge and success in practice he can "step jauntily into the witness-box and show bench, bar, and jury that he knows all about it and can set them right."

When, in June, 1876, we noticed the curriculum of studies marked out in the scheme for the English Conjoint Board, we expressed our astonishment at forensic medicine being virtually excluded from the list of special subjects; for although it had a place at the end of that list, a note in italics was appended, to the effect that questions in forensic medicine are to be included among those asked by the examiners on chemistry, medicine, surgery, and midwifery. To such an arrangement Dr. Maclagan makes the same objection as we did on the occasion above-mentioned; and indeed the practical worthlessness of that arrangement is so evident that no two persons could read the instructions given without agreeing that an examination on forensic medicine conducted in that manner would be nothing less than a farce. As Dr. Maclagan put it, two old proverbs might have suggested themselves to the framers of this clause. One is, that what is everybody's business is nobody's business, and that these various examiners, having their own subjects to attend to, are not likely to give much attention to forensic medicine. The other proverb relates to the danger of falling between two stools; but here we have no less than four on which forensic medicine is expected to poise itself. The author thinks that the framers of this regulation were guided by the maxim, *De minimus non curat prætor*, which they had translated: "The courts will not care much for the evidence of our minimists." And the courts would be right, adds Dr. Maclagan, if this be the way in which forensic medicine is to be set before the eyes of those who are desirous of entering the profession, provided the courts could dispense with the evidence of all but those holding the highest qualifications.

But, as we on a former occasion remarked, and Dr. Maclagan now reiterates, it is upon the evidence of the general practitioner, not on that of the special expert, that the tribunals must depend for the primary information which is essential for their guidance, and if he has not been induced during his hospital career to regard medical questions from a forensic point of view, he may turn out a very indifferent witness, and even make mistakes which may lead to an actual miscarriage of justice. Again, as Dr. Maclagan well observes, forensic medicine is the only branch of his profession which a man may be obliged to practise *nolens volens*. You cannot compel a medical man to practise surgery, nor medicine, nor midwifery, if he does not wish to do so; but if, as physician, surgeon, or obstetrician, he becomes connected with some suspicious case, a magistrate, or coroner, or procurator fiscal may summon him, under penalties, to give evidence in a court, in which circumstance he is practising forensic medicine. In fact, whether it be a sudden death, some accident, a case of poisoning, suicide, or homicide, the general practitioner and not the expert is sure to be first on the scene, and unless he has a fair knowledge of this science, there may be a hundred points of observation he may miss, and a hundred sins of omission or commission of which he may be guilty during his attendance upon the case, and which, to his discredit, will be certainly exposed when he appears in the witness box. He may neglect, or be incompetent, to notice minutely and accurately the exact condition of a person found dead, or his symptoms if alive—to make notes of such facts as might slip his memory—to examine carefully the appearance of a wound inflicted by

a suicide or homicide—to extract from a dying man some information respecting the cause of his death—to take care that vomited matters are not thrown away—to preserve any food, medicine, or bottles, which may have contained poison—and fifty other things which the practitioner who is ignorant of this department of medicine, may forget, or be unable to direct his attention to.

Nor is it merely from a medico-legal standpoint, that Dr. Maclagan was fully justified in defending the position that forensic medicine should take among the subjects of examination. Toxicology is a very practical and important part of the subject we are now considering; and it is only reasonable to infer that a student who has been allowed to enter upon practice without knowing anything about one department of forensic medicine, would be equally ignorant of the other. Not only is the diagnosis of a case of poisoning sometimes a matter of difficulty, but its successful treatment will often greatly depend upon the decision and judgment which the practitioner shows under the circumstances; and consequently, if he has neglected this important branch of his profession, the patient's life may be sacrificed through his ignorance and mismanagement.

For these reasons we quite join with Dr. Maclagan in hoping "that the English authorities will so far re-amend their scheme for a Conjoint Board, as to place forensic medicine in at least as good a position as medical botany . . . . instead of leaving it to the attention, or it may be the neglect, of those examiners who have other and more important matters in their hands." This hope is the more likely to be realised, considering that for some years past one of the English Examining Boards has made forensic medicine an independent subject of examination, great ignorance of which would prevent the candidate obtaining their license.

METROPOLITAN HOSPITAL SUNDAY FUND.

The Council of the Metropolitan Hospital Sunday Fund met at the Mansion House on Tuesday, August 20, to receive the Report of the Distribution Committee, and order the payment of the several awards for the year 1878. Sir Sidney Waterlow, Bart., presided, and he was supported by the Bishop of London, Sir Rutherford Alcock, Mr. McArthur, M.P., Bishop Beckles, Canon Miller, Canon Harvey, the Hon. Mr. Capel, and numerous other members of Council. The total amount recommended to to be paid was £24,460, and this was apportioned as follows:—£22,292 16s. 9d. to 79 hospitals (including 4 institutions which might be classed as hospitals), and £2,167 3s. 11d. to 46 dispensaries. The Hospital of St. John and St. Elizabeth, although it had participated in the Fund from its commencement, and prior to the existing rules, the committee had refrained this year from making a direct award, because their attention had been called to the fact (of which they were not previously aware) that this hospital had no committee of management; nevertheless, having regard to the great economy displayed in the management, and to the consequently small cost of maintenance for each patient, as well as to the fact that the managers and officers of the hospital were all honorary, the committee recommended that the council should award the St. John and St. Elizabeth Hospital on the basis indicated by the hospital accounts published in the Annual Report of the institution. The number of the participating charities had this year increased from 119 to 125. The Chelsea Hospital for Women, the City Orthopædic Hospital, the British Hospital for Diseases of the Skin, the Hospital for Diseases of the Throat, the Bromley (Kent) Cottage Hospital, and the Surrey Dispensary had not renewed their applications for an award on this occasion, and had consequently not been required to furnish their accounts.

The committee having issued invitations to the committees of ten hospitals and dispensaries to meet them by deputation, so as to afford opportunities for explaining or clearing up points which would influence the Distribution Committee in reducing the basis of their award, had only an opportunity of conferring with the committees of two institutions out of the ten, the remainder preferring to accept the decision of the committee without offering any explanations. This must be taken as a conclusive answer to the reckless statement put forth by interested parties that there is an attempt "on the part of the Distribution Committee to overawe and stop complaints from (either) small or large charities." On the contrary, year by year they have courted conferences and a discussion on their awards made, and it may be fairly assumed that when a hospital or dispensary refuses to avail itself of the invitation to meet the Hospital Sunday Fund Distribution Committee there is something that it may be wise to conceal from the criticism of men of business habits. This is actually the case with regard to the institution which the Rev. Mr. Haweis seeks to favour, and this gentleman seeing the invidious position in which he stood very properly resigned his seat on the council of the Hospital Sunday Fund.

With regard to the minute of the Council of January last, relative to the supply of surgical appliances and the Samaritan agencies attached to the several hospitals, the committee, on inquiry, found that the Surgical Aid and Truss Societies refused to supply instruments on *one* letter of recommendation only, and that in every instance the amounts distributed by Samaritan funds were unimportant; and, as any award made upon the usual bases would be trifling in amount, the committee recommended, in order to give effect to the intentions of the Council, the sum of one per cent. of the total amount of the collections in future years should be set aside for the purchase of surgical appliances. Letters of recommendation would then be issued on application to the several contributors to the fund, which letters, as soon as the medical authorities of any hospital or dispensary should have certified that the case was a fit one for relief, would enable the patient to obtain any surgical appliance that might be necessary, through the agency of one of the hospitals or dispensaries.

The question raised by Sir Rutherford Alcock as to whether an hospital spending a large amount in sanitary improvements would be entitled to a grant in consideration of that expenditure, the chairman explained that if the expenditure were made out of capital it would not be entitled to a grant on that particular account; but that

if the alterations were beyond all doubt one for the good of the patients, and paid for out of revenue, then it would count as maintenance and benefit the hospital in the distribution of the fund. With regard to that other question raised by Dr. Glover, as to the desirability of furnishing and printing a more voluminous analysis of the materials upon which the committee based their conclusion, this, apart from the cost, which must necessarily come out of the fund, would be objectionable, inasmuch as it might be made a means of making invidious and injurious comparisons; whereas, the numerical basis on which each institution rests, is well known, and in every case, and at any time, inspection of the returns can be made at the Secretary's office, which is always open to those interested in the Fund.

BELLADONNA AS A CARDIAC AND RESPIRATORY STIMULANT.

Although the discovery of our most valuable remedies and their uses has been hitherto chiefly due to accident and empirical observation, the time seems to have arrived when our knowledge of the action and uses of drugs in the treatment of disease will be much extended by exact experimental research. This is evident from the great light that has been, within the last few years, thrown upon the physiological action and uses of certain drugs about which we formerly knew very little, and the employment of which was restricted to one or two diseases. Digitalis, for instance, has been long known as a remedy in dropsies, but our knowledge of its *modus operandi*, of its action upon the heart, and of the kinds of dropsy in which it is most useful, is comparatively of recent date. In the same manner a more exact method of therapeutical inquiry has brought the action and uses of belladonna into more prominent notice than it has hitherto received from the profession. While years ago belladonna was chiefly used as an external agent, and internally was but partially recommended, and still more partially used, in one or two diseases only, such as whooping-cough and asthma, it is now found to be a very serviceable drug in many other complaints.

It is not, however, our intention to notice the marked influence of belladonna over the secretion of milk, and over the perspiration of phthisis, nor to dwell upon the antagonism existing between it and opium, but rather to notice its action as a cardiac and pulmonary stimulant, and the cases in which, in virtue of this action, it may be successfully employed.

Belladonna has a marked action on the heart and circulation. In moderate doses it raises the blood-pressure in the arteries, partly contracting the peripheral arterioles, and partly by its direct action upon the heart. Dr. John Harley believes that to this action the delirium of belladonna poisoning is to be attributed, and that, in consequence of this same action belladonna is the best direct diuretic we possess for increasing the bulk of the urine. Perhaps, however, the action of belladonna upon the heart and circulation is best illustrated by the experiments which Prof. Fraser made on the effects of that drug in arresting death from Calabar bean in lethal doses. When the physostigma was administered, the number of cardiac beats and of the respirations fell very markedly, but upon the injection of belladonna they rose first above the normal rate, and then again fell to it. After the administration of the Calabar bean to a rabbit the heart's contractions gradually fell from 40 to 32, 22, and ultimately 11 per ten seconds. Some sulphate of atropine was then injected, and in one minute the heart's contractions had risen to 56 per ten seconds, in seven minutes to 60, after which it fell to its usual rate. It may be said, therefore, that belladonna increases the blood-pressure, probably by stimulating the vaso-motor centres, and that, in consequence of this action, we can partly account for some of those objective symptoms usually observed when large doses of the drug are taken. For at first the pulse is slackened, hard, and resisting; then it becomes full, strong, and frequent; the temperature is slightly raised; the countenance is red or flushed; the ocular conjunctiva is brilliant, and the pupils dilated. We say, "partly account for" advisedly, as, no doubt, some of these symptoms are not so much due to an increase in the blood-pressure, as to a reactionary dilatation of the walls of the arterioles, and the admission into them of a larger supply of blood.

Nor is it the circulation only which is affected by belladonna. The observations of Prof. Fraser, Dr. Harley, Dr. H. C. Wood, and Dr. Fothergill, show that this drug has a decidedly stimulating effect upon the respiratory centres. In the experiments of Prof. Fraser, the respirations fell from 20 to 16 in three minutes after the injection of the physostigma; in 28 minutes "there were only infrequent laboured respirations occurring at irregular intervals." After the injection of the atropia, the respirations rose to 15 in 2 minutes, in six minutes to 20 again; and in an hour and a half had settled to 15 per 10 seconds. Similar facts were observed by Prof. Bennett in his report to the British Medical Association on the antagonism of belladonna and calabar bean; while Dr. Fothergill's observations on the antagonism of belladonna and aconite, show that in aconite poisoning the respirations fail, and that while digitalis does not affect the respiration sufficiently to prevent that failure, belladonna does. After the administration of belladonna, the respirations which had been failing under the aconite recovered again, until they reached a normal point. Hence, when death is approaching from paralysis of the respiration, induced by a poisonous agent belladonna restores the respiratory efforts, and so saves the animal from death (Fothergill). We may also remark that besides atropia, strychnia and ammonia also act powerfully upon the respiratory centres when these are being paralysed by disease.

We now come to the practical import of these facts, and to the explanation which they afford of other facts not hitherto intelligible. In the first place there is every reason to believe that the antagonistic effect of this drug in cases of poisoning by opium is due to its influence on the circulatory and respiratory centres. As Dr. Reinhard H. Weber, and others, have remarked, the danger to life in these cases comes principally from the steadily increasing paralysis of the respiratory centres. Hence the great stress which our best authors lay on artificial respiration after all other means have failed. If we can keep up the circulation and respiration, there is a good chance of

recovery, especially as the kidneys (excited to action by the belladonna) are in the meantime constantly removing some of the poison from the blood. From these facts, therefore, taken in connection with the experiments above mentioned, we may conclude that the antagonistic action of belladonna to that of opium depends upon its exerting a contrary influence on the circulatory and respiratory centres to that produced by the latter drug, namely, a restorative and stimulating one. It may also be inferred that belladonna will prove to be equally useful in other poisons which kill in the same manner as opium does.

Moreover, the question arises whether this restorative effect of belladonna upon a paralysed state of the respiratory centres may not be utilised in those affections in which the respiratory functions are disturbed or seriously imperilled; and a few cases have been recently reported which would appear to justify such a supposition. Dr. Reinhard H. Weber, who has given much attention to this subject, relates in the *Philadelphia Medical Times* for August a case of heart disease in which the severe dyspnœa and other symptoms were, in a great measure, removed by belladonna when other remedies had failed. The patient suffered from "stenosis and insufficiency of the aortic valves;" there was great œdema of the lower extremities, and the orthopnœa was so great that in the night he was obliged to sit in his bed propped up with pillows. He had been under the care of a regular physician three months before Dr. Weber saw him, but neither his dropsy nor his other symptoms had been much relieved. To be brief, the belladonna treatment was very successful, and in about ten days from its commencement the patient was able to breathe and sleep comfortably. His kidneys acted well, the dropsy disappeared, and he was able to resume his work.

A similar case is narrated by Dr. Fothergill in his recent interesting work on "The Antagonism of Therapeutic Agents." The patient had a complication of lithiasis, heart disease, chronic bronchitis, and irritable bladder. His nocturnal attacks of dyspnœa had become very distressing, and his nose, cheeks, and hands were of a blue colour "from the paralysis of his peripheral arterioles by the chloral" which he had been in the habit of taking. Under ammonia, strychnia, and digitalis, he greatly improved, but the strychnia so excited his irritable bladder that it had to be stopped, "and belladonna, which exercises the same influence over the respiratory centres, but which lessens the activity of the bladder centres, was given instead." Under this change of treatment the improvement was steady and gratifying. All his symptoms were removed, even the mitral murmur vanished, and his heart began and continued to beat steadily. It might be said that in the first case, the recovery was due to the diuretic properties of the belladonna, but Dr. Weber's patient had taken diuretics alone without any improvement, while, in Dr. Fothergill's case, there was no dropsy present.

Dr. Weber even goes so far as to recommend this medicine as part of the treatment in all cases of collapse or shock in which danger threatens, from failure of the circulation, no matter what the disease is; and he has actually resorted to it with success in severe cases of collapse occurring during attacks of cholera, scarlet fever, typhoid fever, &c. Nor should it be forgotten that belladonna has been long known as a valuable remedy in asthma and whooping-cough, its efficacy in these cases being no doubt partly due to its peculiar physiological action. Belladonna was a favourite remedy in the treatment of asthma with the late Dr. Hyde Salter, and Meigs and Pepper, with numerous other writers before them, have spoken highly of it in the treatment of whooping cough. In fact, this drug would, in our opinion, have been found more generally useful had not practitioners been afraid of prescribing it in sufficient doses to secure its peculiar action upon the system; and perhaps this fear may yet stand in the way of belladonna and other potent remedies having a fair trial in those diseases and conditions of the system in which recent inquiries have shown them to be useful. The reader, therefore, might take a hint from some remarks which a French physician lately made on the subject. In a clinical lecture "On Belladonna," delivered at the Hospital for Sick Children in Paris, M. Jules Simon said: "You will, gentlemen, easily see by the countenance of your patients the effects of the drug; and you ought when prescribing this medicine to bear in mind the principle by which I am generally guided, namely, that of repeating and increasing the doses of therapeutic agents until the physiological effects of the drug are well marked. Just as in treating syphilis of the adult you ought to administer mercury until the first appearance of tenderness of the gums and of salivation shows that the buccal mucous membrane is affected, in the same manner you ought to push the administration of belladonna in children until you see their face flushed and animated, their eyes brilliant, and their pupils dilated. Then you should suspend the administration of the remedy by gradually diminishing the dose; for whilst digitalis may accumulate in the system, belladonna is rapidly eliminated by the kidneys, and the symptoms of intoxication which it causes is essentially evanescent."

We might also allude to the probability of belladonna being useful in many other acute and chronic affections where the respiration is failing—to its use in melancholia and dementia (Crichton Browne)—and to its utility in combination with other medicines, in accordance with a principle now frequently acted upon, namely, that of getting rid of a dangerous or objectionable action of one drug by combining it with another. The scope, however, of this article will not admit of any further remarks on the subject; and we trust enough has been said to show the importance of the reader paying some attention to the researches that are now being made with respect to the action and uses of this and other valuable agents.

Notes on Current Topics.

Extension of Provident Dispensaries.

At a meeting recently held at the Town Hall of Birmingham a Committee was appointed to establish provident dispensaries, but the members of the Birmingham Branch of the British Medical Association were unwilling to co-operate until some effectual measures were taken to check the abuse of medical charity which has been going on so long, but which has only recently attracted much

attention. "Probably," remarks a writer in the *Times*, "medical men think that provident dispensaries stand a small chance of success while dispensaries for the improvident exist in the shape of hospitals that cannot or do not effectually check imposition. The position, therefore, of matters in Birmingham has not been a very dignified or satisfactory one. There was not any great difference of opinion, the question rather being who should begin first. The doctors said reform your hospitals, and the hospital authorities said start your provident dispensaries, and then we will consider the matter."

These little difficulties, however, will be soon got over, and we are informed that already premises have been taken for a dispensary, that a guarantee fund is being subscribed, and that, although the medical associations mentioned will not ally themselves to the scheme, medical men individually are sending in their names and promising the new institution their help and support.

But, although much has been lately said and written in favour of provident dispensaries, one thing appears to be lost sight of, namely, that, to a certain extent these dispensaries are liable to the same kind of abuse as hospitals are, with this difference, that, whereas well-to-do people have been in the habit of going to the hospital *in formâ pauperis*, and throwing themselves completely on the charity of the institution, they may now, for a small pittance, claim as a right what was formerly given to them as an act of charity. We say "to a certain extent," for, doubtless, the publicity which attends anyone becoming a member of a provident dispensary, and the fact that such member must reside within a certain distance of the dispensary, would always preclude any of the middle classes taking that advantage of a provident dispensary which they have been so often known to take of a hospital. It must be admitted that this risk should be taken into consideration by all these dispensaries, for otherwise not only would the old hospital abuses be repeated in a different form, but the general practitioner in the neighbourhood of the dispensary would have reason to complain that almost gratuitous advice was given to patients who could well afford to pay for it.

The Army Medical Department and its Reform.

The questions respecting which the profession was so much agitated at the beginning of the present year, have lain in abeyance since it was announced that the subject had been referred to a special Committee, and that nothing could be said upon the subject until the decision of that Committee became known. The day before Parliament closed its doors, the War Minister was "interpellated" as to the forthcome of the Committee's Report, and his reply was that it had been received, and would be in the hands of members before Parliament re-assembled. The *British Medical Journal* asserts that it is kept back by the War Office for its own purposes, and gives, what purports to be, the gist of the report. It is understood that the proposal will be to abolish or to seriously weaken the guarantees of efficiency of the candidates for the service, by restricting or doing away with the entrance-examinations and the Netley training. Quantity will thus be secured at the expense of quality; and the vacant appointments, which now reproach the maladroitness and bad faith of a past series of administrative errors in the conduct of the department, will be filled without too nice a regard to the fitness of the candidates. During the recent Kaffir war, candidates were secretly drafted in this manner for temporary service. It is proposed, in a word, not to remedy the faults of the present system, but to hide them by "smashing the index." Such a proceeding would unquestionably have been encountered by a storm of hostile and contemptuous criticism, had it been made known during the sitting of Parliament. It is, however, proposed to aid its accomplishment during the recess by offering considerable pecuniary inducements to candidates and bribing the schools; and thus the next Parliament will be face to face with an accomplished fact. If this forecast turns out to be accurate, we anticipate a violent commotion in the House of Commons when the proposal is unfolded. Colleges and medical schools will probably not offer any opposition to a scheme which would open the Army Medical Department, nor will the combatant service trouble themselves to contend against a proposition which will lower the education of the army doctor to a level with that of the ensign—but there can be no doubt that the thinking section of the public will resist the movement with all its energy, and, if the scheme be carried, it will be by the force of the submissive majority of voters, of which the Government can now boast itself.

The Carmichael School, Dublin.

We understand that the coming medical session will see the consummation of a very important change in the medical teaching arrangements of Dublin. The Carmichael School of Medicine has been reorganised, and will migrate from its original locality to the south side of the city, where will then be concentrated the whole of the medical schools of the Irish metropolis. Our readers will recollect that the "Carmichael" School was established by and named after the late Richard Carmichael, and that it was situated close to the Richmond Hospital, in North Brunswick Street, with which institution it co-operated in supplying the school-teaching necessary for the students of the hospital. For some years the school can hardly be said to have flourished, for the distance from the other hospitals and teaching institutions was against it. Recently a proposition was made to the Board of Governors of the Richmond Hospital, by which the school and its lecturers would acquire an improved *locus standi* as regards the hospital, and a more intimate relation being established between the institution. These overtures were not accepted by the Board, and it was consequently decided that the school should be reorganised and removed to the neighbourhood of the College of Surgeons. We understand that premises have already been taken close to St. Peter's Church, the Adelaide Hospital, and Ledwich School, and that the teaching staff of the school is already appointed. Mr. Stoney, who has been for many years a most successful private teacher in connection with the College of Surgeons' school, and Dr. Christopher Gunn of the Catholic University, will be the Lecturers on Anatomy; Dr. Reuben Harvey, on Physiology; Dr. Barton, of the

Ledwich School, and Dr. Corley, on Surgery; Dr. Gordon, President of the College of Physicians, and Dr. J. W. Moore, on Medicine; and Dr. Macan on Midwifery. It is expected that the new school will be opened for students at the usual period for inauguration of the session.

The Outbreak of Diphtheria in Hornsey.

With reference to this outbreak, a meeting of the Local Board was held last Thursday, when a letter was read from the Local Government Board, stating that they had under their consideration the report made by their inspector, Mr. Harrison, after his visit to Hornsey, relative to the sewerage of the district. They enclosed a copy of the report, and they desired at the same time to impress upon the Local Board the importance of their giving immediate and serious attention to the improvement of the sewerage system near Fortis Green, and to the desirability of their introducing flaps at several points of their system, so as to prevent the passage of sewer gas from the lower to the upper part of their district. The Board also thought that the freest possible circulation of air through the ventilators should be promoted, and that where practicable ventilating shafts should be constructed at the dead ends of the sewers. The Board further considered that the local authority should give careful attention to the improvement throughout the district of the house connections, and to the sanitary arrangements in the houses generally. They also desired that the Local Board should adopt Mr. Harrison's suggestion, and instruct their inspector of nuisances or some other properly qualified person to make a house-to-house inspection of the arrangements above referred to, and report to the Local Board thereon.

The Alleged Vivisection in Bayswater.

If anything can show the prejudice that has been created in the minds of the public with regard to vivisection, and the credulity with which they listen to every idle tale that is told them in the street, it is the correspondence which has been lately going on between Mr. Groom Napier, F.G.S., of St. Peter's Park, Paddington, and Mr. George Busk, Inspector under the Vivisection Act.

In the first number of the new quarterly periodical, *Burlington House*, of which Mr. Napier is the editor, attention was drawn to a startling case of the vivisection of a dog in Bayswater. It appears that Mr. Napier, in passing through a street in that district, found it blocked by a crowd, and that he was told by one of the bystanders, that a dog had been that evening the victim to vivisection, that a "party of so-called scientific men had assembled in a greenhouse to witness certain experiments which necessitated the removal of a large piece of its skin," but that the dog, having escaped from its tormentors, had jumped through a pane of glass and escaped into the street. Mr. Napier, not for a moment questioning the truth of the statement made to him, and thinking, perhaps, that such a horrible sensational story would do well for the first number of a new journal, at once rushes into print. The matter then attracts the notice of the Home Secretary, and Mr. Busk is directed to make an inquiry into the alleged occurrence. Mr. Busk, however, thought it desirable to obtain some further information from Mr. Napier, and accordingly wrote to this gentleman a letter, in which Mr. Busk said:—"The statement itself, as you must allow, is at first sight so extravagantly absurd, that before publishing it, you have without doubt taken sufficient means to satisfy yourself that there really is or was reason for believing that in the midst of a crowded neighbourhood a gang of vivisectors was known to exist who practised their experiments in known premises." This letter, however, from its supposed insinuations, gave great offence to Mr. Napier, so that all he did was to refer Mr. Busk to the May number of the journal above mentioned. Soon afterwards, Lord Shaftesbury, who had in the meantime taken the matter up, receives a letter from the Home Secretary, informing his Lordship that inquiry had been made by the police, who found that the dog had been accidentally run over in Gloucester Crescent, Bayswater, and that it had died or was killed immediately after. Nevertheless, Mr. Napier still persists in his story, and the correspondence, which is given at length in the current (August) number of the *Burlington House*, and fully quoted in the *Bayswater Chronicle*, closes with a letter from Lord Shaftesbury, in which, after declaring that we are "living in the midst of devils," he advises the inhabitants of Bayswater "to get up a petition reciting the facts;" a course which Mr. Napier announces himself prepared to take!

Overcrowding and Disease.

With regard to the inquest on the death of a child in Half-Moon Court, Gray's Inn Road, to which we referred last week, the coroner very properly remarked that "the action of the Board of Works was cruel in the extreme. It was all very well to carry out those much desired sanitary arrangements and metropolitan improvements which were to regenerate London, but he thought that the Metropolitan Board should, before evicting the tenants of those houses to be pulled down, erect suitable places for their accommodation, and for the very best of reasons. The poor would insist—and he did not blame them for it—upon living in some place near their work, and if they were driven out of one unsavoury quarter would crowd into another as near to it as possible, the consequence being that the remedy was virtually worse than the disease, and would remain so until the whole of the dens and sties of London had been rebuilt. Under those circumstances he blamed the Board for not acting on the powers conferred upon them by Act of Parliament in the most liberal spirit, which would enable them to provide cheap and suitable accommodation for the working classes."

It is not within our province to comment upon the injustice and cruelty of the Board of Works, but their negligence is, in a sanitary point of view, a circumstance which should not be altogether overlooked. Considering the great attention which public sanitation is everywhere attracting, it seems strange that, in the heart of a great city like London, improvements cannot be made in one quarter without involving almost a corresponding amount of mischief and overcrowding in another. According to the provisions of Mr. Cross's Artisans' Dwellings Act

the Board of Works are supposed to provide accommodation for the evicted inhabitants before their old houses are torn down, and it is to be hoped that our sanitary authorities will impress upon the Board the necessity of taking this precaution. Such cases as those to which we referred last week cast rather a serious reflection upon our boasted social and sanitary reforms, and they are the less excusable, considering that other cities have managed these things better, and have shown that the carrying out of improvements in one part does not necessarily lead to overcrowding, immorality, and disease in other parts. As we have been recently told, the authorities in Dublin have removed no fewer than 31,000 persons during the last ten years, but in such a manner that new and suitable dwellings have been erected even in excess of the requirements of the displaced population. Moreover, some time ago, the Corporation of Glasgow made vast improvements in the worst districts of their city without putting the inhabitants to that inconvenience and distress which many of the London poor appear to have suffered.

Coroners' Inquests.

It would appear from the *Scarborough Mercury* that in some quarters much fault is found with the number of inquests that are held in that town, as compared with those held at Rochdale and the surrounding country. A writer in the above paper compares a case of sudden death at Rochdale, on which there was no inquest, with a case at Scarborough, in which there was one, and then asks: — "In what way did private conduct or public good necessitate an inquest on poor Mr. Hudson? Can anybody tell what we got for our money in the Scarborough practice, and what the Rochdale people lost by theirs? Is life any more secure here than it would have been had no inquest been held on the harmless milkman, or is life any more endangered in Rochdale because the pensioner was buried in peace?"

When a writer asks such a question he seems to forget the very principle on which the holding of inquests in certain cases of sudden death is made imperative by the Legislature. Inquests are a safeguard to the public, and their use is both preventive and punitive. But it will always be difficult to draw the line exactly between cases in which an inquest is, and those in which it is not, necessary; and therefore it is better to take every precaution against the miscarriage of justice at the risk of holding too many inquests, than to run the risk of allowing crime to go undetected, through holding too few. Better that a *hundred* unnecessary inquests should be held than that a criminal should escape detection through *one* inquest being dispensed with. Besides, inquests have a sort of *in terrorem* influence over would-be criminals, whether homicidal or suicidal, and therefore in that respect no inquest that is held can be said to be wholly useless. When once coroners are allowed to perform their duties in a perfunctory manner, we shall have plenty of complaints of people, and especially children, dying under circumstances which warranted a belief that their death was not caused by natural means, a complaint that would be a far more serious one than that made in the *Scarborough Mercury*, to the effect that, through the holding of a few inquests which the writer deems unnecessary, a few pounds have been spent that might otherwise have been saved.

Poor-law Expenditure in Ireland.

From the table which is published in the Report of the Irish Local Government Board, it appears that there has been an increase of £6,658 in "in-maintenance and clothing," an increase of £4,824 in "out-door relief," of £1,195 in cost of "deaf, dumb, and blind," £921 in "salaries and rations of officers," and of £3,573 in "all other expenses," making a total increase of £17,171. The increase in the total number relieved has been 16,936.

The following is a statement of the Parliamentary grant for medical and educational purposes, and for salaries under the "Public Health (Ireland) Act, 1874," for the year ended 25th March, 1877 :—

	Amount allowed for the Year. £ s. d.
Medical purposes	69,773 15 6
Educational purposes ...	9,072 19 3
Total for Medical and Educational purposes	78,846 14 9
For Salaries under Public Health Act	13,347 18 2
Total	92,194 12 11

The total amount allowed under the Parliamentary grant for medical and educational purposes for the year ended 25th March, 1877, namely, £78,846 14s. 9d., is £345 0s. 7d. more than the amount for the previous year.

The amount for salaries under Public Health (Ireland) Act, namely, £13,347 18s. 2d., is £1,180 17s. 3d. more than for the previous year.

While the total expenditure of poor rates for all purposes, viz., relief, medical relief, burial grounds, registration of births, deaths and marriages, sanitary measures, expenses under Superannuation Act, payments under Cattle Disease Acts, and under National School Teacher's Act, was, in 1876, £1,045,505, making a poundage of 1s. 6½d. on the valuation; in 1877 the expenditure for those purposes was £1,030,798, thus showing a decrease in the total expenditure of £14,707. There is, however, an increase on the total poor relief expenditure for the year 1877 of £17,171, but this is more than counter-balanced in the total expenditure, by a net decrease in the other items of expenditure, amounting to £31,878, leaving the actual decrease on the total expenditure for the year £14,707, as above stated.

The current sanitary expenditure for the year was £44,870, in comparison with £39,676 in the previous year.

Metropolitan Water Supply.

The stormy weather of last week seems to have exercised an unfavourable influence over the water supplied by the various water companies to the metropolis. From the high lands the heavy rains brought down with them a very considerable quantity of contamination; and we learn from Dr. Frankland's report that the water drawn from the Chelsea, West Middlesex, Southwark, Grand Junction, and Lambeth Companies, as well as that from the Lea by the East London Company, were much below

the usual summer quality, and were slightly turbid. Moving organisms were seen in the Southwark Company's water, and fungoid growths in that of the Chelsea Company. Viewed through a stratum of two feet deep, all appeared turbid and yellow. The exceptionally high mortality of certain districts appears to be traceable to the impure condition of the water, and diarrhœa became more fatal with the rise in temperature of the Thames water. Thus, the temperature of the Thames, which had been at 60 in the last week in June, rose to 65, and in July to 68, 66, and 67 ; and the weekly deaths from diarrhœa and simple cholera, which had been returned in June at 23, rapidly rose to 76, 156, 256, 349, in the corresponding weeks. The deaths from diarrhœa were very differently and palpably distributed over the fields of the water companies ; thus the deaths in the last few weeks of July were 786 in the districts supplied with water drawn from the Thames and the Lea ; whilst the deaths from those districts supplied with water drawn from the chalk, the Kent Company, were only 19. Again we find in the Registrar-General's Report, of August 10th, the deaths referred to diarrhœa and simple cholera, which in the seven preceding weeks had increased from 23 to 494, declined last week to 343, of which 269 were of infants under one year of age, and 60 of children between one and five years ; and that the fatality of these diseases were markedly increased in the districts of Islington, Mile End Old Town, Poplar, Newington, Battersea, and Camberwell. During the same period we have another remarkable coincidence, that the temperature of the river waters supplied by the various companies ranged from 63·1 to 68·5 Fahr., rendering them all *vapid* and *unpalatable ;* whilst the highest temperature attained by the deep well water was only 56·1. On careful investigation no one can, for a moment, doubt the necessity of supervision being exercised over the health of the inhabitants of the metropolis, and that London should not go on using sewage-polluted water for drinking.

The Registration of Dentists.

The Dental Act came into operation on the first of the current month, and immediately afterwards the Executive Committee of the General Medical Council held a meeting for the purpose of taking action thereon. It was found, upon examination of the Act, that the Council had been saddled with responsibilities and duties which it would never have dreamt of undertaking if it had known of their existence, but the Bill had been allowed to pass without due consideration while the Council was dazed by the questions arising out of the Medical Amendment Bill, and there is now no help for the dilemma into which the Council had gotten itself. Accordingly, it was decided that a special meeting of the entire Council should be called for the middle of October, and that, meanwhile, the registration of dentists should be proceeded with. We hear that the Registrar is overwhelmed with letters of application and inquiry, and, inasmuch as the registration of dentists for Ireland and Scotland is not to be effected in those countries, but in London, we can readily understand that the office in Oxford Street has its hands full. We presume that the registration will be wholesale. By the terms of the Bill (Sec. 6) every person is entitled to be registered who—

(*a*) Is a Licentiate in Dental Surgery or Dentistry of any of the medical authorities.

(*b*) Is entitled to be registered as a Foreign or Colonial Dentist ; or

(*c*) Is, at the passing of this Act, *bonâ fide* engaged in the practice of dentistry or dental surgery, either separately or in conjunction with the practice of medicine, surgery, or pharmacy.

The *bonâ fides* of any applicant is to be determined by the following declaration, which is "required to be made by a person who claims to be registered :"—

"I, John Smith, residing at 14 Waterloo Street, Sheffield, hereby declare that I was *bonâ fide* engaged in the practice of dentistry at Sheffield at the passing of the Dentists' Act, 1878.

"Signed, John Smith.
"Witness, William Robinson.

"Dated this 26th day of August, 1878."

This declaration the registrar may verify, under the 7th section of the Act, by an affidavit, but there is no indication whatever in the Act as to what is to be held to contitute "*bonâ fide*" practice. That is left altogether to the conscience of the applicant, and the Registrar has no power to refuse registration upon the strength of any idea he may form as to the *bonâ fides* of dental practice. We know already, as a matter beyond doubt, that the whole phalanx of druggists who have been in the habit of pulling out teeth, or plugging them with cotton wool or gutta percha, are included, and intentionally included, within the operation of the Act, and are entitled to be officially recorded as dental practitioners. The registration fee will be £2 up to January next, and £5 afterwards, and as there are many tens of thousands of druggists, dentists, and dental mechanics, in the United Kingdom, it may be safely assumed that there will be a rush for the "honours" (!!!) of the dental register.

An Epidemic of Yellow Fever.

America is again suffering from one of those terrible visitations of yellow fever which periodically devastate whole districts in the South, causing the most deplorable panics, which are, in these islands, only understood in a very mild kind of way when an epidemic of small-pox or cholera threatens us. From telegrams received, dated Saturday, the United States Surgeon-General reports that 771 cases of yellow fever and 295 deaths occurred at New Orleans during the past week.

At Vicksburg there have been 400 cases and 69 deaths since the outbreak of the epidemic, and the number is increasing.

At Memphis 144 cases and 53 deaths have occurred during the last six days, and the number is rapidly increasing. Four refugees from infected districts have died at St. Louis. A few cases are also reported from Cincinnatti and Louisville.

The Surgeon-General adds that it is at present impossible to obtain accurate returns of the number of victims at Grenada, the remaining inhabitants being either sick or dying, and abandoned by the panic-stricken negro attendants. Horrible scenes of desolation and suffering are reported. Ninety deaths from yellow fever have occurred at Havana during the past week.

The Small-Pox in Dublin.

According to the Registrar-General's return for the week ending Aug. 17, there is no decrease in the epidemic. The deaths registered for the last ten weeks were as follows:—18, 13, 27, 18, 23, 13, 18, 12, 12, 20. The admission of new cases to hospital within the week were 49, being 12 more than in the previous week, and there was an increase of eight in the number of deaths. The total mortality of the city was 29·1 per 1,000 of the population, and the extent to which dirt and sanitary neglect is chargeable with this excessive mortality, may be judged by the fact that the death-rate for the same week in London was 22·1, in Glasgow 21·2, and in Edinburgh only 18·7, while in the suburbs of Dublin, over which the Public Health Committee of the Corporation has no control, the average ratio was only 16·0 per 1,000. The Public Health Committee remains in a state of collapse, which, however, so far resembles the habitual condition of that body, that the change in the sanitation of the city is not appreciable.

Increase of Lunacy.

The 32nd Report of the Commissioners in Lunacy has just been issued, and we shall shortly draw the reader's attention to its most fmportant features. Speaking generally, it gives a satisfactory account of our asylums, public and private, and it contains a good deal of information not previously tabulated. According to the returns officially made in accordance with the Lunacy Acts, the number of registered lunatics, idiots, and persons of unsound mind in England and Wales on Jan. 1 last, was 65,538 (31,024 males, and 37,514 females), being an increase of 1,902 on those returned for Jan. 1, 1877. The number of private patients was 7,692, composed of 4,172 males and 3,520 females; and the number of pauper patients 60,846, of whom 26,852 were males and 33,994 females. These numbers do not include 265 lunatics so found by inquisition, who reside in charge of the committees, elsewhere than in asylums, registered hospitals, and licensed house.

According to the official return which was presented on Saturday last, the number of small-pox patients at present in the metropolitan hospitals was as follows:—Hampstead, 37; Fulham, 27; Deptford, 149; total, 219. At the previous meeting of the managers the returns were:—Homerton, 5; Stockwell, 16; Hampstead, 62; Fulham, 64; Deptford, 162; total, 3 9. The reduction in the number of smallpox patients was therefore 90.

On accountof the reported prevalence of cholera in Morocco, it has been decided to refuse permission to land from vessels sailing from the North Coast of Africa after Aug. 27, even if they show a clean bill of health. Vessels arriving previous to that date are also refused permission to land passengers if they carry pilgrims. If the passengers are not pilgrims, they will have to preform ten days' quarantine.

Intelligence has been received in Dublin which encourages a hope that Judge Keogh may rally out of the condition of mania into which he suddenly lapsed. His physical health is better. In half an hour after the attack upon his servant he was perfectly calm and rational, and remained so until the day after. The servant Curran, is on a fair way to recovery from his wounds, which have not seriously injured him.

An unconfirmed telegram was received on Monday, to the effect that a number of Moslems forced their way into the military hospital at Banja, and killed the patients, the doctors, and the inmates, and that the Austrians retaliated by indiscriminate slaughter, bombarding the town and levelling it with the ground.

Dr. Nobiling, who made the attempt on the German Emperor's life, will be transferred to a lunatic asylum in order to be observed there, some physicians being of opinion that he is not really deranged, but only simulating madness.

On Saturday last, the magnificent contribution of £3,500 was presented to the Glasgow Royal Infirmary, as the proceeds of an exhibition of paintings lent by the merchant princes of Glasgow and the neighbourhood.

Arsenic has been used in an attempt upon the life of the Emperor of Morocco. His Majesty is at present in a prostrate condition from the effects of this drug.

THE NEW RULES FOR IRISH PRISONS.

The Prisons Ireland Act (40 and 41 Vic. cap. 49), which was passed last year, and under which new rules for the administration of Irish gaols have been framed, has given rise to much debate in medical circles and to influential remonstrances addressed to the Government by gaol surgeons in Ireland. Our space does not admit of our entering fully into the clauses of the Bill which affect these officers, and we must content ourselves with saying that, by those clauses a great number of arduous duties have been added to those with which the surgeons were formerly charged. By the 27th section it is provided that "the officers attached to prisons on April 1, 1878, shall hold their offices by the same tenure and upon like terms and conditions as if this Act had not been passed, and shall receive salaries of not less amount than those which they have hitherto received."

Under this section the gaol surgeons maintain that it is not open to the Prisons Board to impose new duties upon them, although it is admitted that under the 12th section the Board is authorised to "alter or repeal the bye-laws in force for the time being for the regulation of any prison and for the duties and conduct of the officers of the said prison." Nevertheless, the Prisons Board has, as we have said, greatly enlarged the duties of the surgeon, and we presume that it is contemplated that these increased duties shall be paid for—according to the circumstances of each case—by an increase of salary.

Hitherto a somewhat anomalous condition of affairs has existed in respect to the payment of gaol surgeons. By the 6th and 7th Wil. VI. cap. 116, the surgeon of each county infirmary was bound to attend both the prisoners and the officers of the county gaol without fee or reward, and was obliged to produce a certificate that he had done

so, before the grand jury could vote his salary for his attendance at the infirmary. This clause is now repealed, and each infirmary surgeon will receive a separate salary in consideration of his gaol duties. The following are the additional duties imposed by this Act :—

In addition to the duties imposed upon the surgeon of a prison by the seventy-second section of the Act of the session of Parliament held in the seventh year of King George the Fourth, chapter seventy-four, it shall be the duty of the surgeon to see every prisoner in the course of every week, and daily visit the sick prisoners, and the prisoners, if any, confined in punishment cells.

He shall enter day by day, in his journal to be kept in the prison, an account of the state of every sick prisoner, the name of his disease, a description of the medicines and diet, and any other treatment which he may order for such prisoner.

He shall, once at least in every three months, inspect every part of the prison, and enter in his journal the result of each inspection, recording therein any observations he may think fit to make on any want of cleanliness, drainage, warmth, or ventilation, any bad quality of the provisions, any insufficiency of clothing or bedding, any insufficiency in the quantity or defect in the quality of the water, or any cause which may affect the health of the prisoners.

Whenever he has reason to believe that the mind of a prisoner is or is likely to be injuriously affected by the discipline or treatment, he shall report the case in writing to the gaoler, together with such directions as he may think proper, and he shall call the attention of the chaplain to any prisoner who appears to require his special notice.

He may, in any case of danger or difficulty, which appears to him to require it, call in additional medical assistance, and no serious operation shall be performed without previous consultation being held with another medical practitioner, except under circumstances not admitting of delay, such circumstances to be recorded in his journal.

He shall, forthwith on the death of any prisoner, enter in his journal the following particulars, videlicet, at what time the deceased was taken ill, when the illness was first communicated to the surgeon, the nature of the disease, when the prisoner died, and an account of the appearances after death, together with any special remarks that appear to him requisite.

It is not, however, of the imposition of these additional duties that the surgeons specially complain, but of the putting upon them the duties of apothecaries, which are not mentioned in the Act or in the rules, and which have been always hitherto discharged by a regular pharmaceutist. By the 59th section it is provided that "any enactment contained in the Prisons Acts which requires that a local inspector, or more than one medical officer, or an apothecary, shall be appointed for any prison, shall be and the same is hereby repealed," and the Prisons Board has availed itself of the permission thus given to it to abolish the office of prison apothecary, and compel the surgeons to dispense as well as prescribe the medicines. There are forty gaols in Ireland, and the arrangements adopted in them for the compounding of medicines have not been uniform. In seventeen of them an apothecary was retained at a salary, in 22 of them the medicines were supplied by a local apothecary as a contractor but not as a prison officer, and in one of them the surgeon acted as apothecary, receiving a special salary for the duty. As we have said, the recent Act sets down with minuteness the duties of the surgeon, and the rules which have received the sanction of the Privy Council, reiterate the enumeration of those duties, but as the dispensing of medicines is nowhere included the Prisons Board has thought fit to send away the apothecaries and throw their work upon the surgeons. The great majority of these officers protest most emphatically against the imposition of this new function, and have put their remonstrance in the form of a memorial, and have also represented the matter verbally by means of a deputation to the Under Secretary. They maintain that the addition of a new and troublesome duty to their previous functions is a breach of the contract under which they hold their offices. They protest that their time is too much engaged; that there are officers already existing more competent for such a duty than the surgeon; and lastly, that they cannot undertake drug compounding without lowering their professional position. From the fact that, up to the present time, the infirmary surgeon was—*ipso facto*—the gaol surgeon, and that he was also necessarily Licentiate of the Irish College of Surgeons, it happens that very many of the gaol surgeons—11 out of the 40—are Fellows of that College. These gentlemen are bound in the following declaration :—

"I will, to the utmost of my power, endeavour to promote the reputation, honour, and dignity of the said College, and I do not practise the businesss or profession of an apothecary or druggist, and I will not, so long as I shall be a Fellow of said College, practise such business or profession."

Should the Prisons Board insist upon carrying their intentions in this respect into effect, the gaol surgeons who are Fellows must either resign their Fellowship or their office in connection with the gaol, or, inasmuch as this step would involve the loss of their pensions, refuse to undertake the dispensing of the medicines, and leave the Board to its own course. The nature of the reply given to the deputation, and the tenor of the observations of the chiefs of the Prisons Department, lead us to hope that none of these alternatives will be inevitable, but that the Board will see fit to rescind their order, at least, as regards the surgeons now in office.

THE DENTAL LICENSE OF THE IRISH COLLEGE OF SURGEONS.

As the registration of dentists has commenced, it is open to the colleges named in the Dental Bill to proceed at once to hold examinations. We understand that it is probable that the Council of the Royal College of Surgeons will at once elect a Special Court of Examiners, and that an examination will be held in the first or second week of September for the admission of candidates. We shall lay full particulars before our readers in due course.

Medical News.

University of London.—*First M.B. Examination—Examination for Honours :—*

Anatomy—1st Class.—John Shaw, Exhibition and Gold Medal, St. Thomas's Hospital; Victor Alexander Haden Horsley, Gold Medal, University College. 3rd Class.—Percy Edward Shearman, University College.

Histology and Physiology—1st Class.—Richard Bredin, Gold Medal, Liverpool Royal Infirmary School of Medicine; Charles Alfred Weber, B.A., B.Sc., Gold Medal, St. George's Hospital; Robert Maguire, Owens College; David Alexander King, St. Bartholomew's Hospital; Victor Alexander Haden Horsley, University College; Percy Edward Shearman, University College; John Shaw, St. Thomas's Hospital. 2nd Class.—Louis Alfred Cantin, St. Bartholomew's Hospital, Arthur Edward Permewan, University College, equal; Denis McDonnell, King's College, Beavan Neave Rake, Guy's Hospital, equal; Louis Coltman Parkes, University College; Thomas Kirsopp, St. Bartholomew's Hospital, William Rushton Parker, University College, equal. 3rd Class.—Henry Thurston Bassett, Queen's College, Birmingham, and Guy's Hospital; Walter Duncan Thomas, St. Bartholomew's Hospital; Henry Hoole, Charing Cross Hospital; Thomas Vincent Dickinson, St. George's Hospital.

Organic Chemistry—1st Class.—Richard Bredin, Exhibition and Gold Medal, Liverpool Royal Infirmary School of Medicine; Beavan Neave Rake, Guy's Hospital; Robert Maguire, Owens College.

Materia Medica and Pharmaceutical Chemistry—1st Class.—Percy Edward Shearman, Exhibition and Gold Medal, University College; John Shaw (obtained the number of Marks qualifying for the Exhibition), St. Thomas's Hospital; Henry Maudsley, University College. 2nd Class.—Arthur Edward Permewan, University College; Arthur Newsholme, St. Thomas's Hospital, Beavan Neave Rake, Guy's Hospital, equal.

IRISH POOR-LAW INTELLIGENCE.

IRISH MEDICAL ASSOCIATION.

PUBLIC HEALTH (IRELAND) ACT, 1878.

Royal College of Surgeons.
Dublin, August 9th, 1878.

DEAR SIR,—By direction of the Council of the Irish Medical Association, we take the earliest opportunity of acquainting you that the "Public Health Bill" has become law.

We may remind you that in May, 1877, a petition was presented to the House of Commons by the Dispensary Medical Officers of Ireland, praying that the law might be altered in the following respects :—

(*a*) That a system of independent supervision, analogous to that which exists in England, should be established in Ireland ;

(*b*) That proper remuneration should be provided for the performance of special sanitary duties—such as visiting the sick on ship-board, certifying for the removal of bodies of persons dead of contagious diseases, and attending in court as professional witnesses ;

(*c*) That the scale of remuneration then in force should be withdrawn—by which a sanitary authority could not allow, for his services under the Public Health Act, to a dispensary medical officer more than a fourth of his salary as such ; inasmuch as the remuneration so paid (which, in but very few instances, reached the maximum) proved inadequate, and caused widespread dissatisfaction ; and

(*d*) That the title of "Sanitary Officer" should be changed to that of "Medical Officer of Health."

On the 17th of May, 1877, this Association sent a deputation consisting of three members of the Council to London, to wait upon Sir Michael Hicks Beach, then Chief Secretary for Ireland. The deputation, which was accompaied by sixteen members of Parliament, was courteously received, and the foregoing subjects were very fully discussed. The Bill was subsequently referred to a select committee of the House of Commons, when it was considered essential to send a second deputation to London. Dr. Grimshaw (then chairman of Council), was deputed to represent the views of the Association, and he had to remain in London during the time the Bill was before the select committee ; his thorough knowledge of the subject was of incalculable benefit in guiding the members of the committee, and unquestionably had this Association merely sent forward a written statement of its views, little or nothing would have been conceded. It was through its representatives going to London, and proving to members of Parliament, at personal interviews, the justice of our claims, that the results about to be commented upon were effected—results which give this Association much reason for congratulation—in a word, with the exception of the first request in the petition of the dispensary medical officers, namely, independent supervision, every point has been granted.

Independent Supervision.

The Irish Medical Association has always strongly advocated the system of independent supervision, but has invariably been met with an official reply to the effect that the Local Government Board had the power already if they considered it necessary to exercise it, or, in other words, that it was a subject for administration and not one requiring legislation ; but Sir Michael Hicks Beach informed the deputation that he did not deny that more supervision was required.

In the report of the Local Government and Taxation of Towns (Ireland) Commission, dated 15th February, 1877, the necessity of supervision is strongly commented upon, and reform in this respect advocated.

In reference to the supervision question, it may be stated that the vice-president of the Local Government Board for Ireland, in his evidence before the Royal Sanitary Commission, gave it as his opinion (in reply to question 11,971), that the staff of the department would require augmentation in the event of obtaining additional control over sanitary affairs ; it is the augmentation thus indicated, and which experience has shown to be necessary, that the Association still seeks to have effected.

The Viscount Powerscourt, at the request of the Council of this Association, placed the following amendment on the notice paper of the House of Lords, viz.:—

"The Local Government Board shall, from time to time, appoint so many fit persons as the Lords Commissioners of Her Majesty's Treasury shall sanction, being practising physicians or surgeons, to be inspecting medical officers of health, to assist in carrying out the provisions of this Act, and may remove all or any of such officers and appoint others in their stead.

"There shall be paid to such inspecting medical officers of health such salaries as shall, from time to time, be appointed by the Lords Commissioners of Her Majesty's Treasury, out of any moneys which may from time to time be provided by Parliament for that purpose.

"Within six calendar months after the passing of this Act, the Local Government Board shall divide the whole of Ireland into districts, for the purposes of sanitary inspection, and every such district shall be subject to the supervision of an inspecting medical officer of health."

But as the Government represented to him that the insertion of this clause would probably give rise to such opposition in the Commons, as would imperil the passing of the Bill, Lord Powerscourt thought it unwise, at that late period of the session, to press the matter further, and accordingly withdrew the amendment.

With reference to the other points it will, perhaps, be the most convenient course to take them in the order in which they occur in the petition.

Sanitary Duties on Ship-board.

Section 152 of the Public Health Act, 1878, provides that "whenever the medical officer of health of any sanitary district performs any medical service on board ship

he shall be entitled to charge extra, at a rate to be fixed by the Local Government Board, and such charges shall be payable by the captain of such vessel, together with any reasonable expenses for the treatment of the sick," whereas in this Bill, as first introduced, the words alluding to such payment ran thus :—"He shall be entitled to charge extra for such service at the general rate of his allowance for services for the union, district, or place for which he is appointed." This latter arrangement would have been most unsatisfactory, and would have permitted only a fee so ludicrously small as not to exceed, in many instances, *one penny a visit!*

Certifying for Removal of Dead Bodies.

Section 158 fixes a guinea as the fee for certifying for the removal of the body of a person dead of an infectious disease; whereas in the clause in the Bill, as first introduced, no provision was made for remuneration. Subsequently a fee of ten shillings was inserted, which, owing to the exertions of this Association, was raised to a guinea.

Remuneration for Evidence at Sanitary Prosecutions.

In section 258 provision is made that the medical officer of health is to be remunerated for giving evidence in court at sanitary prosecutions at a rate to be approved by the Local Government Board. In the Act of 1874 there was no provision of this kind, and this was felt to be a great hardship. As the section is an important one, it is thought advisable to give it *in extenso* :—

"Every officer of a sanitary authority shall attend and assist in any prosecution instituted by such authority on receipt of an order from such authority so to attend: Provided always, that if a medical officer of the sanitary authority shall so attend and assist, he shall be entitled to remuneration from the sanitary authority at such rate as the Local Government Board shall approve, unless it shall have been agreed that the duty of affording such attendance and assistance shall be included in his salary, or that his whole time shall be occupied in the discharge of the duties of his office; and such payment shall be deemed to be expenses incurred by the sanitary authority under this Act, and may be recovered as part of the costs of the prosecution."

The words "*unless it shall have been agreed that the duty of affording such attendance and assistance shall be included in his salary*" might possibly be overlooked or misconstrued, and therefore the Council of this Association are desirous that every *medical officer of health should be warned not to make any such compact*, which would prevent him claiming his fee for attendance and evidence at court.

Withdrawal of Fixed Scale.

In section 11 the scale by which the fourth of his dispensary salary was the maximum the medical officer could receive for carrying out sanitary duties has been withdrawn. This scale question was always felt to be the greatest grievance the medical officer suffered from. Comparing this section with the English Public Health Acts, it will be seen that no *fixed scale* of remuneration is sanctioned by the English Acts, the salary of each officer being left an open question to be decided on its merits. It appears from the correspondence between the Local Government Board for Ireland and the Treasury (published in the Report of the Board for 1874), that the scale of salaries suggested by the Local Government Board was sanctioned only because it "*did not appear to be exorbitant*"!

In some instances where sanitary authorities were willing to remunerate the medical officer of health somewhat more liberally than the fixed scale allowed, the Local Government Board for Ireland has to state that they were exceeding their powers; but on the other hand the Board had to compel a few local authorities to pay more liberally than they proposed.

The withdrawal of the scale now enables a sanitary board, with the consent of the Local Government Board and the Treasury to apportion suitable remuneration to a district medical officer of health, on the merits of the case, which is the fair principle to go upon, and it is to be hoped that this power will be suitably exercised. The difficulty of having the scale abolished was almost insuperable. Sir Michael Hicks-Beach informed the deputation he would not be unwilling to see the scale raised, but said the difficulties with the Treasury were very great. *The Select Committee last session allowed the scale to remain*, but the energetic action of the late Chairman of Council, and his representations to Sir Michael Hicks-Beach, induced him to influence the Treasury, and he made a conditional promise that if the Bill was permitted to pass last session he would withdraw the scale. Owing, however, to opposition from a few members of Parliament, at a late period of the session, the Bill was withdrawn. Upon its reintroduction this session, it was found the scale had been left in. Very recently, Mr. Meldon, the member for Kildare, impressed upon the Attorney-General for Ireland and others the importance attached by the Irish Medical Association to this question, with the gratifying result of obtaining its withdrawal. The Association is most deeply indebted to Mr. Meldon for the valuable advice and assistance he has on all occasions rendered the Association in reference to the Public Health Bill.

The Council are of opinion that the Medical Officers of Health should prepare to apply to their sanitary boards for equitable remuneration.

New Title—Medical Officer of Health.

In section 11 the title of Medical Officer of Health is conferred in the following words :—"The medical officer of a dispensary district shall be a sanitary officer for such district under the title of 'Medical Officer of Health.'"

Titles of other Sanitary Officers.

In sections 87 and 59 respectively, the "executive sanitary officer," and "sanitary sub-officer," are respectively alluded to as "Clerk of the Sanitary Authority" and "Inspector of Nuisances." These alterations were advocated by the Irish Medical Association, in order that each official should have an intelligible designation, as was always the case in the corresponding Acts for England.

Notice of Interment to be given to Registrar of Deaths.

In section 191 provision is made that a return, containing the name, address, date and cause of death of every person who shall have been interred in each burial ground shall be made to the registrar of deaths for the district in which the death took place, which will provide for a more complete registration of deaths than has hitherto existed.

Observations.

The above observations dispose of the matters of interest to the medical officers of health, and for obvious reasons could not well have been abridged, but for further information the Act itself should be consulted.

The object of the Public Health (Ireland) Act was to consolidate into one act the various provisions, with respect to sanitary matters and burial grounds, of the several Acts in force (no less than twenty-six in number), and to amend them where required. The new act will prove a great convenience and advantage to all concerned in carrying out the sanitary laws in Ireland.

When it is remembered that a period of three years has elapsed since the introduction of the Public Health Bill, containing no less than 294 clauses, and the many difficulties and obstacles it met with, the Council are gratified to be able to announce the satisfactory result of their exertions with regard to this measure, which involved constant labour and considerable expense—the latter amounting to about £150, or about half the income of the Association for one year. The expenses were of necessity heavy; the cost of the deputations alone having been £120. We take this opportunity of reminding those members whose subscriptions are still due of this fact, and would observe that it is quite impossible to carry on effectively the affairs of this important Association, numbering over 600 members, unless the annual subscriptions are paid punctually. No better proof of the usefulness of this Association, or of its successful exertions, need be cited than the modifications which it has obtained in the Public Health Act. The hon. treasurer, Dr. Minchin, recently reported to the Council that a sum of nearly £300 was due to the Association, some members' annual subscriptions being three or four years in arrear; a state of matters which is much to be deplored.

In conclusion, it is hoped and expected that those dispensary medical officers who have hitherto held aloof from the Association will now come forward and have their names added to

the list of its members, and thus help to defray the expenses incurred in obtaining advantages for them, towards which they have not hitherto contributed, notwithstanding the fact that they have gained so considerably by them; for the greater the amount of support accorded to the Association the greater its power and influence—with natural results—must be.

We remain, yours faithfully,

THOMAS PURCELL, Chairman of Council.
JOHN WILLIAM MOORE, Hon. Sec. to Council.
JOHN H. CHAPMAN, Hon. Secretary.

MOUNTMELLICK UNION.

PAYMENT OF SUBSTITUTES.

THE following letter was read from the Local Government Board:—

"Local Government Board, Dublin,
"7th August, 1878.

"SIR,—The Local Government Board for Ireland have had before them the resolution of the board of guardians of Mountmellick Union of the 27th ult., proposing to cancel the order made on the 20th ult., for payment of the temporary substitute for the medical officer of the Clonaslee dispensary district during the illness of the latter; and the Board desire to point out that the guardians had no power to 'cancel' or rescind the resolution of the 20th ult. without the necessary notice.—By order, &c.

"B. BANKS, Sec."

PAYMENT IN MIDWIFERY CASES.

The Local Government Board forwarded a letter received from Dr. Rice, Mountmellick, relating to his claim for remuneration for assisting Dr. Neale in a difficult midwifery case, and also for acting as temporary medical officer for Dr. Neale during his illness for three weeks. Dr. Rice's letter was as follows:—

"To the Local Government Board.
"Mountmellick Union, 5th Aug., 1878.

"GENTLEMEN,—On the 8th May last, before five o'clock in the morning, Dr. Neale, the medical officer of the Clonaslee dispensary district in this union, sent to me by his own man and car a note requesting me to assist him at once in a bad case of midwifery—a dispensary patient. I did so immediately, and on application being made to the board of guardians for my fee of £2 2s., I am informed that not having been sent for by the relieving officer they would not pay me. I did the duty when called on, and under the circumstances urgent as they were. Dr. Neale had no time to lose looking for a formal relieving officer's order at that hour in the morning, between three and four o'clock, unless with great risk for the safety of the poor woman. The distance from Clonaslee to here is seven miles. On the 17th June last the dispensary committee of Clonaslee, as on former occasions, appointed me *locum tenens* for three weeks at £3 3s. per week for Dr. Neale, who broke his arm, and to whom they granted leave of absence; and on applying for payment after having performed the duties, I understand that two guineas a week was agreed to be paid by the board, and on the following Saturday some members of the board of guardians, and who supported the payment of the two guineas, brought forward a resolution condemning their act of the week before, and passed a resolution that I was not to be paid. I was appointed by the dispensary committee. I was told so by one of its members a couple of days after the appointment. I had it recorded on the books of the committee, and if the honorary secretary neglected to inform the board of guardians at the time, I do not see why I should suffer by such neglect. My demand is £11 11s. —£2 2s. for midwifery case, and £9 9s. for three weeks at the dispensary. I respectfully lay these facts before your Board, and await your reply.—I am, &c.,

"HENRY J. RICE, M.D."

A desultory conversation took place on the letter, which ended by Mr. Peacock giving notice he would move on this day fortnight that Dr. Rice be paid two guineas in the midwifery case and three guineas per week for acting substitute for Dr. Neale.

Mr. Cobbe handed in a counter notice of motion—that the resolution granting Dr. Rice two guineas a week for acting substitute to Dr. Neale be rescinded, as it was unjust to ask the ratepayers to pay for a substitute be (Dr. Neale) not having become incapacitated while in the discharge of his duty.

SCARIFF UNION.

IT appeared from the minutes of the Feakle dispensary committee that complaints were made by that body for some of their members issuing tickets for medical attendance to persons in comfortable circumstances. In one case where a red ticket was issued the doctor was offered a fee but refused to take it, and the committee wished to know from the Local Government Board what course a medical officer was to take in future where fees were offered under similar circumstances.

The Chairman—It is very hard to ask a doctor to attend where fees can be paid. Dr. Dunworth was offered a fee in this case; where Mr. Keane issued a ticket, he did not take it, the doctor indeed admitted the party was very poor. There was another case of a woman named Margaret Naughton, whose poor-law valuation was £13. She paid her rent satisfactorily, and ought to be able to pay a doctor. In a third case—whose name he forgot—a ticket was received, though he could drive his own jaunting car.

Dr. Cogan—The committee should bear in mind that medical officers undertook those duties for miserable salaries to attend paupers, but not persons having twenty cows on the field.

The subject then dropped.

CARLOW UNION.

A LETTER from Dr. William O'Meara was read, in which he said—I beg leave to remind the Board that in *every case* where attendance at cholera sheds was thrown upon the Dispensary Medical Officer, special remuneration has been made to him by the Board. Consequently the sum of £8 is due to me for attendance.

The Chairman observed, with reference to Dr. O'Meara's application, that it had been the usage of the Board to pay their medical officer for attendance on cholera or small-pox.

Mr. Casey concurred in opinion with the chairman, and said he had made references on the subject, and found that the chairman's memory was quite correct, as the books of the Union showed. He therefore, believed it both quite right, and in accordance with the usage of the Board, to pay exceptional fees to the medical officer for exceptional work.

The Chairman ruled that the application be endorsed subject to approval of Local Government Board.

ABBEYLEIX UNION.

THE SALARIES OF SANITARY OFFICERS.

THE following important reply was received from the Local Government Board respecting the proposition passed by the guardians some time ago, to reduce the salary of the consulting sanitary officer (Dr. Swan) from £20 to £5 per annum:—

"Local Government Board, Dublin,
27th July, 1878.

"SIR,—The Local Government Board have had before them a resolution of the board of guardians of Abbyleix Union of the 25th ult., proposing to reduce the salary of the consulting sanitary officer from £20 to £5 per annum, on the ground that he was only called on upon three occasions since his appointment to give his attention to

sanitary matters; and in reply I am to state that in the event of a vacancy occurring in the office the Local Government Board will be prepared to take the guardians' present proposition into consideration; but as the present officer has been appointed, and the salary fixed and approved of, the Local Government Board consider it would be an unusual course to make any alteration in his remuneration.—By order, "B. Banks, Sec.

"The Clerk, Abbeyleix Union."

The following resolution was unanimously accepted:—"Resolved, that the letter of the Local Government Board, dated 27th July, 1878, in reply to the unanimous resolution of the board of guardians of the 24th June, 1878, proposing the reduction of the salary of the consulting sanitary officer is not satisfactory, as if accepted by this board it would virtually place the officers independent of the board of guardians, especially as the Local Government Board state in their letter that they will be prepared to take the proposed resolution into consideration in future appointments. We request them to reconsider their decision, and sanction the proposed reduction."

LEAVE OF ABSENCE TO MEDICAL OFFICERS.

Mr. Mercier, on behalf of the secretary of the Durrow dispensary committee, forwarded the following extract from minutes:—"Dr. Palmer having upon the grounds stated in his medical report applied for leave of absence of four weeks, we recommend that his substitute be paid out of the rates, and that Dr. Stoney fill his place at three guineas a week. The chairman dissented to the payment of the substitute, as Dr. Palmer's illness is not stated to have been caused by his duties attending the dispensary.

The recommendation of the committee was adopted.

Mr. Lodge said the chairman's ground for dissent was that it was not shown that the doctor got sick in the discharge of his duty.

Mr. Owen remarked that the Donaghmore board of guardians had a resolution on their book not to pay a substitute for any officer unless he was incapacitated by ill-health while performing his duties.

Mr. Owen.—Was he incapacitated by over-exertion in doing his duty?

Mr. Lodge.—I cannot say that.

Mr. Owen.—Because if not, you may have this a chronic case, going from month to month.

REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING AUG. 17, 1878.

Total registered deaths in Dublin and suburbs*	... 176
Ten years average of same week	... 123
Excess of mortality above average	... 53
10 weeks' ratio of deaths Rathmines	18·7 per 1,000
" " " Donnybrook†	16·4 "
" " " Blackrock	13·7 "
" " " Kingstown	15·2 "
" " Entire Dublin District	29·1 "
COMPARATIVE RATIOS—London ...	22·1 "
" " Glasgow ...	21·2 "
" " Edinburgh ...	18·7 "

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

Fifty-six deaths resulted from zymotic diseases, being 9 more than in the preceding week, and 24 over the average for the 33rd week of the last ten years. They include 20 from small-pox, 17 from diarrhœa, 4 from whooping-cough, 4 from fever (1 typhus, 2 typhoid, and 1 simple continued fever), 2 each from scarlatina and diphtheria, and 1 each from quinsy, croup, and simple cholera, &c. The deaths from small-pox registered during the last ten weeks have been respectively—18, 13, 27, 18, 23, 13, 18, 12, 12, and 20. Lf the 20 deaths recorded last week 3 are chargeable to the North City Districts, 15 to the South City, 1 to Rathmines, and 1 was a case admitted into hospital from without the Registration District. The number of new cases admitted into the Dublin Hospitals last week was 49—being 12 more than in the preceding week; 38 patients were discharged; 17 died, and 119 remained under treatment on Saturday last, being 6 less than at the close of the previous week.

Twenty deaths from convulsions were registered.

LECTURE I.—(*Continued*).

(*Continued from page* 161.)

Definition of Anteversion and Anteflexion

Connected with the subject of the mechanics of the uterus is the definition of what constitutes anteverson and anteflexion. Before proceeding further this definition is absolutely necessary.

One question to be determined is—What is the amount or degree of anteversion or anteflexion which the uterus possesses in a state of health?

This is partly an anatomical and partly a clinical question, and, abstractedly speaking, it is one not easy to settle. And yet some settlement must be arrived at before we can with advantage discuss the frequency and importance of certain varieties of uterine distortion and displacement.

Since attention has been more prominently directed to the subject of uterine flexions, the remark has been frequently made by critics on the opposite side that it is natural to the uterus to be in a state of anteflexion or anteversion; and this by no means precise statement has been urged as an objection to the views of those who attach clinical importance to the existence of anteflexion. It appears that, normally, the uterus has, before puberty arrives, a very slight tendency to anteflexion or anteversion, and that the increased growth and development of the organ coincident with puberty involves, amongst other things, a certain relative elevation of the fundus and a diminution of the flexion. It appears also that in some cases, where the general development is retarded or interfered with, the uterus may retain for some time after the ordinary age of arrival of puberty this slightly anteflexed condition. But I believe that these cases are altogether exceptional, and that the amount of anteflexion which the perfectly normal healthy uterus possesses is very slight, though I admit that it is appreciable in degree.

A circumstance to which I would direct attention in the endeavour to estimate the degree of this anteflexion is the importance of not confounding the slight natural anteversion of the uterus towards the horizon as the patient stands upright with real anteflexion. The uterus, when in its natural position (see fig. 1), is situated with its long diameter very nearly in what is termed the curve of Carus. A line starting from a point a little behind the centre of the pelvic brim, and following this curve, would be slightly inclined to the horizon, the body being upright. Regard must be had to this circumstance. Next we must endeavour to estimate the amount of change of position of the uterus involved in the physiological action of the other pelvic organs. The bladder has an important influence in this particular. How far do varying conditions of the bladder, as regards fulness or emptiness, affect the position of the uterus in a state of health? It seems that the middle portion of the uterus, and a part just below this, are intimately connected with the bladder; the uterus and the posterior and lower angle of the bladder are thus inseparable. This portion of the uterus, moreover, does not move forwards to more than a very slight extent, in consequence principally of its fixation by the utero-sacral ligaments. On the other hand, it would seem that in great distension of the bladder this part of the uterus might be pushed considerably backwards. Dr. Braxton Hicks has made some interesting experiments showing the effect of extreme distension of the bladder in producing retroversion. What happens to the fundus of the uterus, however, when the bladder is empty? Does the uterus fall into a state of anteversion, with the fundus occupying the position of the bladder, or do the intestines descend to fill up the vacant space created by evacuation of the bladder contents? Observation has convinced me that in a state of health the oscillation which occurs is between the bladder and the intestines, and not between the bladder and the body of the uterus. Probably, therefore,

the motion forwards of the body of the uterus during collapse of the bladder is very slight when the parts are in a normal condition.

I wish here to insist on the fact that in making an ordinary digital examination of the uterus, when this organ is in its proper position, the body of the uterus cannot be felt by the point of the finger unless it be introduced a very considerable distance. Contrast, for instance, the distance of the anterior part of the body of the uterus from the vulva aperture in the accompanying figure—fig. 12—the uterus being in a state of decided anteflexion, with its position in fig. 1, p. 139. It should not be possible easily to define the anterior surface of the fundus uteri by the finger. The circumstances are altered in either of two events—(1) when the uterus as a whole descends too low ; (2) when it is anteverted or anteflexed. Now, under either of these circumstances, the finger readily arrives at the body of the uterus, and its outline may be defined with more or less completeness, according to the degree of the displacement. If the fundus be readily, or too readily, recognised by the touch, the uterus is not, according to my view of the matter, in its normal position. No one of course doubts the existence of anteversion ; no one at the present day disbelieves in the existence of anteflexion, but there are many who do not recognise these conditions in the cases actually under their observation, either because they do not look for them, or because, as frequently happens, really severe anteversions and flexions are overlooked or under-estimated. The misapprehension arises from a want of accuracy of definition as to what is normal anteversion ; as to what is the line dividing this latter from a real displacement. From what I have seen in private, and in consultation practice particularly, I am aware that the foregoing statement as to the general want of precision in regard to what is and what is not anteversion or flexion, as the case may be, is correct. Again, it should be borne in mind that under ordinary circumstances the examination is made with the patient lying on the side or on the back. My own observations have almost invariably been made in this manner. But it seems evident that if the patient were in the standing position any existing anterior displacement might be considerably intensified. I strongly suspect that such exaggeration does actually occur, and if

FIG. 12.

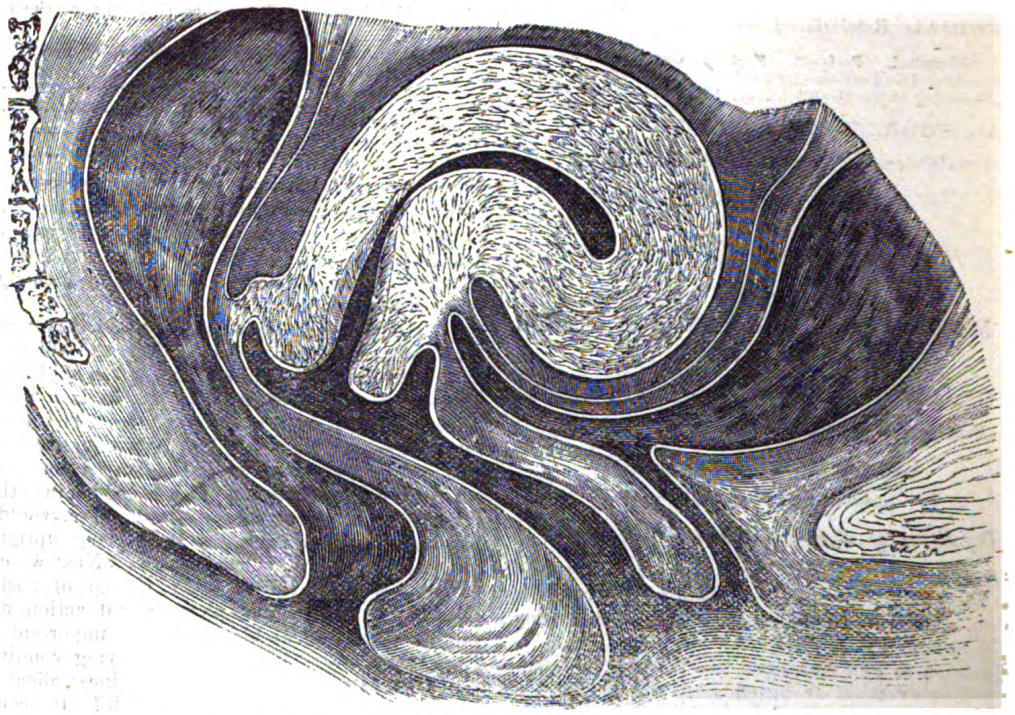

Fig. 12 represents a case of what may be termed the second stage of anteflexion of the uterus, with resulting displacement of fundus downwards and forwards.

so, the conclusion is natural that the degree of anteversion present as the patient lies on the side is really less than what occurs in the upright position of the body. At all events, this would seem to show that conclusions as to the frequency of anteversion and flexion based on examination made in the lateral position are more likely to underestimate than to over-estimate this numerical frequency.

In order to avoid needless repetition, I have coupled anteversion and anteflexion together ; but, of course, it must be understood that anteversion pure and simple may be present without involving necessarily any flexion ; and, *vice versâ*, there may be anteflexion without any version accompanying it. More commonly the two are associated, there being a preponderance of one or the other element in different cases. There is more difficulty in diagnosticating by the touch anteflexion alone than when it is accompanied by version, unless in cases where the uterus as a whole is lower down in the pelvis than usual. When the uterus is abnormally high in the pelvis, acute flexion forwards may be present, and may be difficult to appreciate by the touch. Such cases are, however, very rare, and in very few instances of acute anteflexion is there any difficulty whatever in outlining the tumour thus created by the ordinary digital examination.

It will be observed that, in speaking of the recognition of anteversion or flexion, I have said nothing of the use of the sound, and purposely so, because, as a diagnostic aid, it should only be used after careful digital examination has been made. To use the sound as the first procedure may have the effect, unless it be very judiciously employed, of so disturbing the real position and shape of the uterus that erroneous inferences may be drawn. If the uterus be soft and much flexed the sound may straighten it for the moment, and the distortion is thus undetected ; and when

the uterus is not soft, the mere introduction of the instrument almost necessarily alters the position of the organ, reducing an anteversion, and restoring the axis of the uterus to its proper position for the time being. If, as is sometimes done, the speculum be first introduced, and the sound passed in through the speculum, no idea of the real position or shape of the uterus can possibly be arrived at. Many cases of severe anteversion and flexion thus escape recognition. It is obvious that in any attempt to ascertain the actual position and shape of the uterus great care should be taken to disturb it as little as possible by use of instruments, in the first stage of the investigation at all events.

Respecting *retroversion* and *retroflexion* of the uterus it may be said that the definition of these conditions requires little to be added. All agree in considering an inclination of the axis of the uterus backwards a retroversion, and flexion of the canal backwards a retroflexion. And it is admitted on all sides that retroversion and retroflexion are not natural conditions of the uterus. Usually, also, the diagnosis of these conditions by the touch is easier, a projection backwards behind the posterior vaginal cul-de-sac being at once recognised as something abnormal.

Forces of a Dislocating Tendency.

It will be necessary in the next place to consider the nature of the forces which may be brought to bear on the uterus, and which are capable of materially altering its physical relations. Intimately connected with this question is another—the effect of certain abnormal conditions of the uterus in weakening its natural resistance to the effects of mechanical forces; but it will be convenient to keep the two questions for the present dissociated.

What, then, are the mechanical forces which may act prejudicially on the uterus? The most powerful of these is, undoubtedly, a fall, and especially a fall in which the lower part of the sacral region comes violently and suddenly in contact with the ground or other hard substance. Instances of this kind are: slipping on the pavement on a piece of orange-peel; being thrown from a carriage; tripping while going down stairs, an accident which sometimes involves a succession of shocks, as the lower part of the spine strikes step after step in the progress downwards. The most healthy uterus may, in consequence of such accidents, become dislocated.

Hardly less severe in their possible effects are violent strains and sudden powerful muscular exertions made by individuals unaccustomed to such efforts. A young lady I knew lifted a patient, who had fallen on the floor out of a chair, from the floor to the chair again, and sustained thereby severe injury of this kind. Another, in a spirit of bravado, carried a heavy weight across a room with a similar result. Then lifting invalids from side to side of the bed I have frequently known to produce great mischief when done by young ladies unaccustomed to much physical exertion. Trained nurses are aware of the effect of these and like exertions in producing severe uterine disturbance. Several cases which have come under my notice have had their starting-point in the effort of removing heavy pieces of furniture.

Excessive and tiring walks and long mountain expeditions are very liable to severely strain and displace the uterus. Young women require to be carefully trained for such exertions, or great mischief may in this way result; they should not be permitted to undertake such exertions unless after being gradually accustomed to them, and even then there is great risk. Great mischief results from the excessive walking practised at some schools as part of the daily routine; the weakly ones are occasionally seriously injured in this way.

(To be continued.)

FIG. 13.

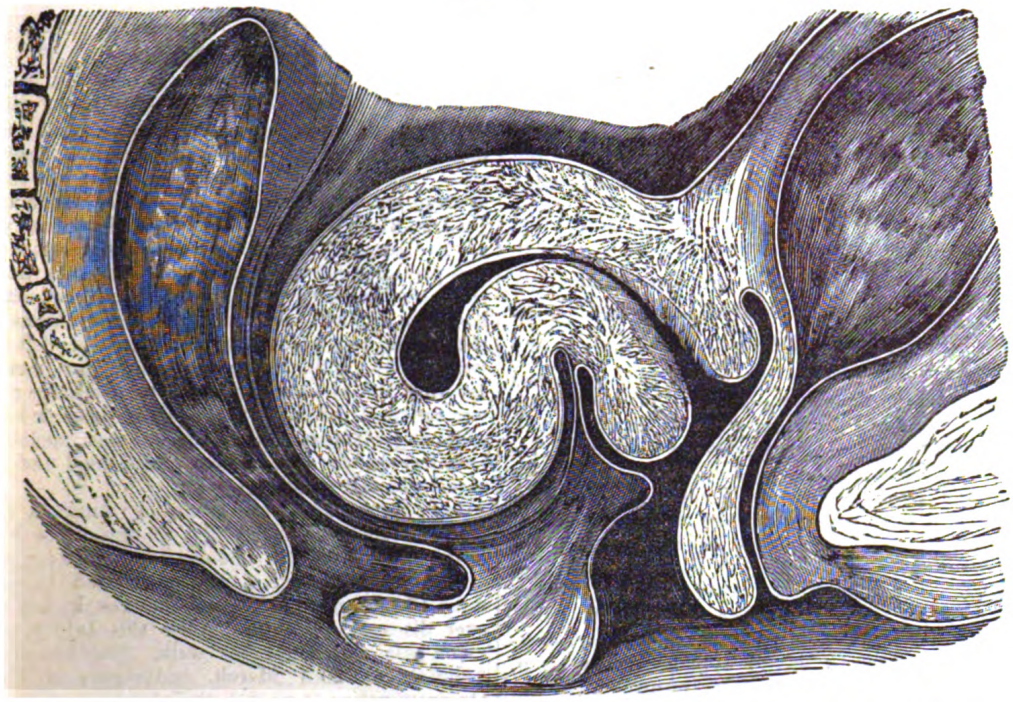

Fig. 13 represents a third stage of retroflexion of the uterus with considerable pressure on the rectum.

INFANTILE diarrhœa is not quite so prevalent this season as usual, if we except one or two large towns. The deaths from scarlet fever and diphtheria are excessive in Birmingham and Salford, whilst small-pox has almost disappeared throughout the kingdom, 23 deaths only being reported during the week.

ON SAYRE'S TREATMENT OF SPINAL CURVATURES BY PLASTER JACKET. (a)

By H. MACNAUGHTON JONES, M.D., F.R.C.S.I.

THIS time twelve months, the British Medical Association accorded to Dr. Sayre, of New York, such a reception and ovation during his demonstrations on spinal cases, as is seldom accorded by British surgeons to any visitor.

The immediate success of his treatment, as visibly and practically proved at those demonstrations, carried his audiences completely away, and the enthusiasm manifested at this new and valuable means of treating spinal curvatures was great. One year has passed by, and British surgeons have given, all over the United Kingdom, the plaster jacket and suspension a fair trial, and though hardly sufficient time has yet elapsed to obtain a decided opinion as to the value and superiority of this support and plan over others, still, in that time, many surgeons in various degrees of spinal deformity, must have sufficiently tested its utility to help to a conclusion. I had the advantage of seeing Dr. Sayre give a demonstration a second time in Cork, subsequently to his Manchester visit, and having treated an unusually large number of spinal cases by the jacket, I thought it might prove of use to put on record my experience of the *permanent* benefit of this method of Dr. Sayre. I say permanent, but I may add that the more I see of the plaster jacket, the more convinced I am that it is wrong to jump at hurried conclusions, and that it requires months, and it may be years, before we are justified in arriving at decided conclusions on the special advantages of the plaster support. We are all too prone to run after new forms of wonderful cures, and the crucial tests which time alone supplies are overlooked or ignored in our desire to applaud an invention, or see in it some advantage over other means which have failed to satisfy our wishes, or which do not meet all the difficulties which a variety of cases are sure to present. At the same time, I think it is not right to expect more than average results in the way of permanent cures from any given method. Cases must constantly occur which will fail under any treatment, and it must have happened in the case of the plaster jacket, that it has been applied in instances where no permanent cure, nor indeed temporary benefit could with reason be expected, so advanced was the disease, and so great was the deformity. So it has been with me. But at first so anxious were the parents to try the benefit of the treatment, and so solicitous were they to have it applied, that many cases were put up in whom no material benefit could, with justice, be looked for. I have already (December, 1877), in the *Dublin Monthly Journal of Medical Science*, published the particulars of thirty cases. Most of these, I have, with some difficulty followed the subsequent history of. These, with others, whom I have treated since then, and patients treated by medical friends, who have furnished me with notes or them, I shall give the general results of, with special allusions to some extremely interesting cases treated by them and me in this manner. This may act as an inducement to others to do the same, and to place the permanent results of their cases before the profession. I have no intention to do more in this paper than to give *results*. As to the treatment itself, the method of applying it in various classes of cases, and any recent hints and suggestions, I have not time to allude to these, my object being merely to tabulate and record results. This, I believe, must have greater practical value, and is the best evidence of the advantages of the jacket.

(a) Abstract of a Paper read before the British Medical Association, at Bath, August, 1878.

Ethel G., æt. 3, for six weeks suffered from obscure symptoms, unable to stand, pain in knee, and constant desire to pass urine ; does not sleep at night. On examining spine on 20th Dec., 1877, tenderness discovered over second and third lumbar vertebræ. She was on the same evening put up in Sayre's jacket by Dr. Grattan, of Cork. On Dec. 21st slept well ; no pain, and desire to pass water not so frequent. On the 24th she was able to walk a little, and played about with other children. On 1st June last could not move or go about without jacket, four of which had been applied since December. An abscess connected with spine, and which pointed a little below left trochanter, was opened, and a large amount of pus removed. On 1st July the abscess continued to discharge ; the jacket was removed, when the little patient became helpless, and suffered great pain till a new one was applied. On the next day she was able to move about, and has since been able to be taken out regularly.

Mrs. S., æt. 27, twelve years ago suffered from spinal disease, which compelled her to remain in bed for five years. At end of that time she became better, got married, and had two children, and continued in good health until 13th March, 1878, when she was kicked in the back over diseased vertebræ. After this injury she suffered much pain, and could not walk. She was admitted into hospital on 20th March, under care of Dr. Grattan. On examination there was great tenderness over first lumbar and last dorsal vertebræ. She had lost the power of motion in lower extremities ; was unable to pass urine, and the catheter had to be used. On 23rd March with great difficulty she was suspended, and put in plaster bandage, as recommended by Dr. Sayre. On 30th she was free from pain, was able to pass urine, and could walk about. On the 31st she walked from the hospital without permission, and has not since been heard of.

Joseph H., railway porter, æt. 17, Pott's curvature in lower dorsal vertebræ ; came on gradually, thinks from raising weights ; difficulty in walking and raising weights, general health fair, but pale and anæmic look. Sent by me to London to get appliance : put up at Orthopædic in August, 1877, by Dr. Sayre. At his work from the following September ; came to Cork in March perfectly restored in health and spirits ; could walk any distance and raise his loads without trouble. I put on a second jacket. He still continues well, and now wears no cuirass.

Lizzie P., æt. 13, spine affected fourteen months, very bad lateral curvature (*vide* photo.), in every way broken down in health ; wearing the spinal support for a considerable time without benefit. Put up by Dr. Sayre in Cork in September, 1877 ; improvement only temporary. I put on a second cuirass ; I do not think the jacket has done any service in this case ; heard of her July 24th.

J. C., æt. 13, spine affected six years after a fall, could not walk more than a mile at farthest without resting his hands on his knees, angular curve in dorsal region. Case a perfect success—when he had grown strong and healthy-looking I exhibited him at the Cork Medical Society He continued so well that he was put by his parents to some employment at which he was overworked, abscess formed, and he is now recovering from this, and to come again for support.

H. H. C., æt. 5, brought to Cork from England. History as given by mother: Healthy child as infant; when eighteen months old suffered from whooping-cough, which left him delicate, and when two years of age the child first showed signs of spinal affection with debility in the limbs; in May, 1875, advised perfect rest, and until the cuirass was put on, on November 1st, this perfect rest was enforced; a spinal support was made in London, and since 1876, in the mother's words, he has constantly worn the spinal support, and the utmost strictness used with regard to keeping the child still, and for this purpose leather straps across the chest and leather buckles for the legs have been used. The little fellow has also used an invalid's cup, and, indeed, in every possible way the accommodation has been such as to prevent the slightest necessity for movement on the part of the patient. On the 31st October, 1877, when the child was nearly five years of age, he was brought to Cork, where he went through Dr. Sayre's process—viz., the suspension and cuirass; the next day it was quite a difficult matter to keep the child from his feet, which had not felt the ground for quite two years and a half. The success of this treatment appears to be complete, though of course, from the long disuse of the limbs, we must expect it will be some weeks before they regain sufficient strength to walk alone. On the 9th of November last I heard that the child walked when allowed, was quite comfortable, and going on well. I have quite recently learned that the boy was still more improved in health and strength, and the parents were anxious to have a cuirass again put on and to get the old one cut. This has been done in England, and I learn the child is quite restored.

J. H., æt. 10, Pott's curvature in the lumbar region; kept in hospital, strapped to couch, and treated constitutionally for six months. When Dr. Sayre came to Cork, this child, with the case before referred to, was put up in jacket by him at a demonstration, and he instanced the case as a difficult one, the curve being so low down, the patient could not walk, and moved (even with the support of the hand) with difficulty. I subsequently put on a second jacket; this case is a perfect success, the curvature is now hardly noticeable, and the child is strong and healthy, playing about, wearing no cuirass, and completely altered.

J. D., æt. 14, confirmed angular curvature in dorsal region; spine affected for seven years, result of fall; pain in the side occasionally; at times burning pain in the back; cannot sit down well; must kneel to everything; can walk about a quarter of a mile, and must then rest, put up on 17th October, 1877, in cuirass; became able to walk much better, and without pain, looked more healthy and strong, and felt quite comfortable. On 23rd of this month, August, I got a letter from his mother with the following particulars:—"His health was good, appetite good, and getting every day stronger, up to last April, you cautioned him, so did I, not to take long walks. Against your advice, he went last April as far as Lisgoold, on a fishing excursion with another young fellow; the day was wet, and he sat down on the grass to rest himself; the result was a heavy cold, ending with paralysis of the lower limbs. I would at that time have written to you, but as I did not wish to submit his weak frame to a galvanic shock I nursed him up to the 1st of June, when I sent him to the seaside, where he is at present. His strength came back again, and he is now at the present time enjoying his usual health, walking about as well as ever. When paralysed he got bed sores, so I had to remove the jacket. I would like again to have the jacket (or a new one) put on."

G. S., æt. 5, about one year since had strumous abscesses in the hand and leg; he next showed symptoms of genu-valgum, and complained of his back; no history of injury; came to me on crutches; had been in the recumbent position for ten months; Pott's curvature of the lower dorsal and upper lumbar vertebræ. On the 6th October put him on the cuirass. It was wonderful to see the delight of this child immediately after the cuirass was on; the little fellow felt quite independent of his crutches and ran about without help. For a long time he continued well and happy. The jacket, however, did not in this case get a fair trial for an angular case, as it was cut, and I do not believe the permanent result was as good as it otherwise would have been. At present this little fellow has some abscess in the gluteal region, but he complains if left without his support.

The next was a sad case. M., æt. 20, subject to nervous attacks and epileptic fits occasionally; lateral curvature, which has come out within the past few years, and is now extreme; prominence of right scapula, and curves in the dorsal and lumbar regions. This was a very heavy girl, and difficult to suspend. I put on the jacket one week after the brother's. She found great support and comfort from it. She came into Cork about three weeks subsequently to get the jacket cut, in order to suspend herself. The jacket was off for a few days; during this time she got a slight attack of inflammation of the left lung, this she recovered from; her health, however, became worse, though the jacket was a great support and relief to her. Soon after she died, as I learned, in one of the nervous attacks.

M. H., married, æt. 32, has had four children; had to leave her home in America from ill-health; first noticed spine affection when sixteen years of age, then very slight; came to me to the Hospital for Women and Children last winter, to consult me for confirmed lateral curvature. The spine was curved like the letter S. She was never without pain; slept badly; often the pain was excruciating in the back; she could not sit straight, and always had to bend forward, resting her elbows on her knees, which were kept wide apart. On the 10th of September I put on the jacket. When Dr. Sayre was in Cork he saw this patient, and she thanked him for the great relief and the benefit which she derived from the jacket. This case has perhaps been as striking an example of the good of the jacket, as I have ever seen. When I wrote my previous report in December the woman was in much better health; walked better; slept well; and thoroughly appreciated the great good she derived from this treatment. I wanted her previously to go to London to the Orthopædic Hospital to get a spinal support, but she could not afford it. She has returned to America, and was in good health on her departure.

R. P., æt. 5, had a suppurating cyst under the sterno-mastoid muscle March, 1877; subsequently had an attack of rheumatic fever; both left him suffering from wry neck and great debility. He had been to the seaside, but the change had done him little service. The wry neck was followed by lateral curvature in the dorsal region, caused by the yielding of the body to the left side; he lost the use of the lower extremities, and this was followed by partial want of power in the upper. Altogether, when brought to me in the middle of October, he was in a pitiable state. I first put on a curiass, and afterwards applied a jury-mast. I subsequently received this letter from his father, who himself made the jury-mast:—"From the time he got on the curiass he has made rapid strides, and is putting on flesh, and looking well, while the jury-mast has been most successful. The little patient is certainly marvellously improved; he has plucked up in flesh, got colour into his cheeks, and the neck with the jury-mast has become quite straight." He wore the latter for some months, gradually the curve in the spine lessened, and when last I saw him I had him at the Cork Medical Society completely restored, and able to walk his two miles and run about. The child is now as well as ever.

Ellen W., æt. 12, brought on March 19th, 1878, suffering from Pott's disease in mid-dorsal region of five or six months' standing; for the past two months was entirely incapacitated from walking and unable to put the feet firmly on the ground; no cause could be assigned, family history good, is the youngest of a large family, *condition thin*. Appeared a delicate undergrown child of a strumous diathesis, with an ulcerated surface over the left clavicle, there was a considerable prominence in the mid-

dorsal region which had led to deformity, stooping posture with hands on thighs, and elevation of the shoulders; she could not bear to be touched anywhere or moved from the recumbent or semi-recumbent position, and complained much of pains down the thighs and legs, locating this especially in the left hip joint; appetite bad, respiration distressed, of a grunting character.

On March 30th suspended in Professor Sayre's apparatus by Dr. Ringrose Atkins, and he applied plaster jacket as usual; patient was excessively irritable, and the procedure was with difficulty carried out, the prominence was considerably diminished, and the amount of elongation was found to be three-quarters of an inch. That night the patient had no rest and kept constantly crying, and injured the upper portion of the cuirass by endeavouring to remove it; this went on for several days, the child refusing food and being very hard to manage, the pains however had entirely disappeared; abbreviating the history, it will suffice to say that for three weeks she obstinately refused to stir from her bed or from the right side; at the end of that time she was induced to sit up, and then improvement began to take place rapidly; her father unfortunately cut the cuirass over the hips, which allowed the hollow fitting on the prominence to become displaced, and as a result of the friction consequent on this a little ulcer formed, which the patient began to complain of. I then with some difficulty cut a round aperture from the jacket over the spot she indicated and came exactly on the sore, which I then dressed with zinc ointment and which healed in a few days; soon after another little abrasion occurred, which was similarly treated. During this time she began to put the feet to the ground, and with a hand and the support of the table she was able to take a few steps, and this was increased daily. On May 17th I removed the first cuirass, and at the same sitting again suspended and put on another plaster case, this time with much greater ease and a similar amount of elongation; unfortunately, some little time after the back again became sore, necessitating the removal of a round piece through which it was dressed, and in a short time it quite healed; her walking powers and strength now increased daily, she was able to progress without any assistance, walking with a peculiar rotation of the pelvis (a waddling-like motion), the elevation of the shoulders lessened wonderfully, and when dressed no deformity could be noticed in the back; by degrees the waddling gait has disappeared, her legs have increased in size and strength, and she is now (July 22nd) able to walk about quite well and go up and down stairs unaided. She has been for some weeks at the seaside, and her appearance indicates returning health; she still wears the cuirass, which fits her beautifully, and though at first so averse to having it on, now says that when this one comes off she would like to have another. During the treatment she has taken compound syrup of the phosphate of iron, and the muscles have been stimulated by massage.

ON THE ARREST OF UTERINE HÆMORRHAGE BY FLUID PRESSURE.

By DAVID CHRISTIE, L.R.C.P. Ed., L.F.P.S. Glasg.,
Carrigart by Letterkenny, co. Donegal.

I THINK it will not be disputed by any one that an infallible and safe remedy for uterine hæmorrhage is much required. Ergot, turpentine, cold water, or hot water, has been tried; but who can truly assert that any of these is sure to succeed?

Every accoucheur of experience knows them to be useless in hæmorrhage following the removal of an adherent placenta, because the site of the adhesion cannot contract. In your edition of 7th August, you have said all that any one need say about compression of the abdominal aorta, so that any remarks I could make would be superfluous.

Dr. Barnes relies on the injection of perchloride of iron, but that looks very like the old plan of arresting hæmorrhage by boiling pitch or strong acids. I would propose to treat hæmorrhage of the uterus the same as we do it anywhere else, *i.e.*, by compressing the part from which the blood escapes, and applying some antiseptic, as if it were an ordinary wound.

It has been discovered by experiment that if a tube be inserted in an artery, the heart's action is capable of rising a column of blood in the tube seven feet and a half; hence *that* amount of pressure applied to *any* bleeding surface *must arrest the hæmorrhage.* But I have found from experience that about two feet elevation gives sufficient pressure to arrest hæmorrhage in the uterus. I have invented for this purpose a very simple and inexpensive instrument. It consists of an india-rubber bag, and a tube of similar material four feet long; to the end of this tube is attached a stop-cock, and within a few inches of it the elastic tube passes through a piece of metallic tube, which is bent into the form of a syphon, which causes the entire tube to act as such when required. Being provided with such an instrument, and having to treat a case of post-partum hæmorrhage, press the air out of the bag, it will then be in a convenient shape for introduction into the uterus; turn the stop-cock, which will keep it so, then introduce the empty bag, at the same time let an assistant have at the proper height above the patient a vessel holding more water than will fill the bag, immerse the stop-cock, and open it while under water; the elastic bag will then act as a suction pump, the tube as a syphon, their combined powers will cause the water to enter the bag at the rate of one ounce per second for every quarter of an inch the tube is in diameter, and by having the size of the tube in proportion to the size of the bag, a large one can be filled as quickly as a small one. The bag will be filled in a few seconds, the pressure equal over every part of the uterus, and sufficient to instantly arrest the hæmorrhage, yet the uterus is free to contract and expel the water through the tube. When the uterine contraction ceases, and relaxation takes place, the tube will again act as a syphon, and keep up the same pressure, so that in any case the pressure on the uterus is always the same, yet it is free to contract and hæmorrhage is impossible.

What can be more simple than this to any one who knows what a syphon means, and understands the principle on which the hydrostatic bellows act? Those who do not will find all the information they require in any work on Natural Philosophy. I have been using different modifications of this instrument for the past twelve months; in its present form I can stop any kind of uterine hæmorrhage in from ten to twelve seconds; any one who doubts this let him stake £100 against me and we will see who will win. There has been any amount of twaddle written on this subject lately, and I think this is the quickest way of stopping it.

I have used the instrument I have been describing in cases of placenta prævia. For that purpose cold water should be employed, but tepid for post-partum; it is only necessary to shut the stop-cock when the pressure within the vagina has stopped the flooding, which it will do instantly; no matter how long it remains, it does not interfere with the labour, and when it is expelled the child's head occupies its place. In post-partum cases the bag should always be smeared with glycerine, which is better than carbolic acid. The instrument is made by Hilliard, 65 Renfield Street, Glasgow, one capable of holding ℥xvii. would do in most cases; its cost would be about six or seven shillings, but it can be got any size. I have now given the result of my past twelve months' experience, and hope it will give as much satisfaction to others as it has given to myself.

N.B.—I have given directions to Mr. Hilliard to construct an india-rubber vessel of a very simple and convenient shape, and very portable, to be employed as a reservoir for the instrument.

Clinical Records.

LARIBOISIERE HOSPITAL, PARIS.

A Fact against Cerebral Localisation.

By PROFESSOR JACCOUD.
Physician to the Hospital.

— SCHMIDT, female, æt. 60, was admitted into my ward at the Lariboisière on the 11th July last, at ten in the morning. She died on the 13th at three a.m., that is to say, at the end of twenty-nine hours.

Information furnished by her Friends.—In the last six weeks she had three apoplectiform attacks, not followed by paralysis. On the 11th July, at one p.m., a fourth attack supervened, producing the group of symptoms noticed on the admission of the patient to hospital.

Symptoms.—Coma. Profuse perspiration.

Paralysis.—Hemiplegia of left members, with incontinence of urine,—respiration equable on both sides—right facial paralysis limited to lower portion—deviation of labial commissure, and features, most marked towards the left. Deviation of the head and eyes to the *left*, viz., to *paralysed members*. This symptom is as marked as possible.

Convulsions.—Several very short attacks of convulsive seizures, limited to right side of face (paralysed side). On the 12th, the convulsions, beginning always on the right side of face, extend to limbs on same side—they continue strictly *right unilateral*. On the evening of the 12th they stop.

Temperature.— On the 12th, morning, 40°·4 C; evening, 40° C. (in right axilla). Death took place at three a.m. on 13th July.

Lesions.—In the *right hemisphere*, the focus, or seat of diffluent inflammatory softening. The ascending frontal, the paracentral lobule of Betz, the ascending parietal, are intact. The disease began in front, at the convolution, following the ascending parietal, and extended behind, as far as the occipito-parietal fissure. This *foyer* formed a cubic mass, limited.

In Front: by the intact ascending parietal, and the calloso-marginal fissure.

Behind: by the occipito-parietal fissure, prolonged on the external face of the hemisphere, behind the *pli courbe*.

Within: by the inferior border of the convolution of the corpus callosum.

Without: by the inter-parietal fissure.

Above: the broken down surface, formed the superior face of the lobe.

Below: the softened vault of the lateral ventricle formed the inferior *face*. All the mass between these limits, is softened to destruction. A small grey lamella on the *avant-coin*, remained intact.

Consequently, the *parts destroyed*, are the *superior parietal lobe*, with the exception of the ascending parietal and paracentral lobule, the two upper thirds of the *pli courbe*, the *avant coin*, and *convolution* separating it from the calloso-marginal fissure. *The convolution of the corpus callosum*, in the extent embraced between the parietal-occipital, and the calloso-marginal fissure. All the other parts of the encephaloid are absolutely intact, colour, consistence, vascularity normal.

THE fearful epidemic of yellow fever which we announced in our last as devastating whole districts in the Southern States of America continues with unabated force. Several members of the medical and clerical professions have succumbed in the midst of their ministrations.

Special Correspondence.

THE INTERNATIONAL CONGRESS OF HYGIENE.

[FROM AN OCCASIONAL CORRESPONDENT].

THE Congress is over. It may be written down a success. The papers were exceptionally good. Your translations should be appreciated by your readers. You are paying the French reporters a high compliment by devoting so much of your valuable space to them. There are a few circumstances in connection with the Congress I should like to allude to.

Under the sanction of the French government and on the invitation of the *savants* of France this Congress was held, and foreign visitors attended at considerable expense and sacrifice of time.

Some rooms at the Tuileries were placed at their disposal gratuitously. The afternoon meetings were held at the Palace of the Trocadéro. I regret to say, however, *a charge was made each day for admission*. This I consider to have been a want of hospitality. Was it due to some oversight? Evidently not. The French Government should have graciously granted the privilege of free admission to all foreigners, whereas, on the *carte personelle*, the following *notâ* was ostentatiously printed—

NOTA.—*Cette carte ne dispense pas de l'obligation d'acquitter le droit d'entrée à l'Exposition* (ART. 5 *du Reg. Général*).

Each member would probably pay eight or ten francs for admission to the meetings; this sum, though small, must be considered a tax upon science. If 1,000 Associates attended ten times, and paid a franc each time, the Exposition Universelle would thus realise 10,000 francs, a mere bagatelle, it is true, but still evidently a sum that was considered worth saving.

I do not think it probable that the visitors went through the Exhibition on each occasion, so that a franc was thus charged for the use of a room.

Could not a more convenient hall have been provided, free of charge? The great distance between the Tuileries and the Trocadéro should have also been taken into account, for the fatigue involved in going from one building to another was very great.

It has been said that France manages such things better than we do, and that her hospitalities to visitors are greater than those of any other nation.

This is open to very grave question. Her politeness I grant. Judging by this Congress, her hospitality falls far short of that of the Germans or English.

It is only just to point out these mistakes, for excessive laudation of all the proceedings might have a tendency to inflate the Committee, and they might in a possible future repeat their errors. This is only a minor point.

Science should be studied for itself alone. Scientific meetings are interesting *per se*; but the pleasure of such gatherings is enhanced by social meetings, by receptions, dinners, *soirées*, &c., &c. The German Association of Naturalists and Physicians may be regarded as a high-class society. The most eminent men in the world of medicine attend the annual meeting. But they are not above social enjoyment, which is provided for them liberally by their hosts.

The British Association is another scientific body. Dublin has entertained the members right royally. The citizens of Dublin invited them; the Royal Dublin Society, the Lord Lieutenant, and the Mayor, provided for their material wants, and there have been dinners, excursions, *soirées*, receptions, almost *ad libitum*.

The Congress of Hygiene, under the patronage of the French Government, does not seem to have taken a similar view, or considered it necessary to incur any similar expenditure. Food for the mind was provided. I must make a correction. It was thought desirable to have a dinner, to invite the *savants*, and to have a mutual interchange of compliments; hence, as the *Progrès Médical* expresses it, "que M.M. les organisateurs regoivent nos compliment les plus sincères sur la façon splendide dont la fête a était organisée." (!!!)

It is easy to organise a feast, under similar conditions; each member had *the privilege of attending the dinner by paying 20 frs. for a ticket*, and at that price a very good dinner can be always secured either in Paris or London, so that I fail to see what reason there is for congratulating the committee on "*la façon splendide dont la fête était organisée.*"

If the Committee had invited the Foreign associates, if the

Minister of Agriculture and Commerce, or the French Government had defrayed the expense, some praise would be due for such liberal hospitality. Under existing circumstances the congratulations of the *Progrès Médical* are misplaced.

France invited the world of sanitarians to Paris, about 500 came, and spent a fair sum of money in her capital, but France, unlike other countries, received them with politeness, but with a strict regard to financial economy. I am not expressing my own opinion but that of others who attended the dinner, to whom a sovereign was a trifle. I do not know whether members of the foreign press were invited, I did not see your special representative there.

The occasion of this meeting was a great and noble one, and never in the French capital was there such an assemblage of men, interested in the cause of humanity, from almost every quarter of the globe. There were Belgians, Italians, Germans, Spaniards, Russians, Austrians, Portuguese, Swiss, Greeks, Turks, Danes, Roumanians, Chinese, Japanese, Englishmen, Americans—representing medicine, surgery, chemistry, architecture, engineering, &c., numbering in all about 500.

The municipal authorities of Paris might fitly have entertained them at a banquet, and still more, the President of the Republic might have opened his salons to them and given them a reception.

Look at the contrast between the Celts in Dublin and the Celts in France. It may be said *tant pis* for the pockets of the Hibernians.

I remember on a far different occasion the reception of Englishmen by the Belgians, I allude to the Volunteer Visit—such hospitality has never been equalled, though the object was not such a noble and worthy one as that which drew so many hygienists to Paris.

Leaving this perhaps, unpleasant subject, I shall make a few remarks on the excursions, as they were called, and first on the list are the visits to

L'Ecôle Monge and Hôpital Menilmontant.

Your special correspondent has mentioned the work done on the Thursday, Friday, and Saturday. Sunday was the day for the first excursion, if it may be so called, evidently on the principle of *lucus a non lucendo*. Members were invited to present themselves at nine in the morning at 145 Boulevard Malesherbes, to inspect "L'Ecôle Monge."

This school was founded in 1869, and is an excellent example of a well managed and hygienically constructed establishment. I may say the visit was an interesting one. At three in the afternoon the members were invited to present themselves at the Hôpital Menilmontant.

Such of your readers who know Paris will remember the situation of Père la Chaise. The hospital is situated at a little distance from it.

The hospital was well worth a visit, though one of the staff of the Assistance Publique is reported to have said, *Quelle diable dideé M. Michael Moring a-t-il eue de nous envoyer les membres du conseil d'hygiene?*

It was a very good idea, and though the hospital was subjected to much hostile criticism, the general feeling was one of satisfaction.

It has cost 9,939.000 francs. It provides accommodation for 635 patients. It is constructed on the pavilion system, and the internal arrangements in general are good. There are some defects which it is possible to remedy, and which have been pointed out already by your excellent contemporary, *Lé Progrès Médical.*

The next excursion was to the

Farm of Gennevilliers, and to the Drains of Paris,

The former, taking place at eight in the morning, the latter at three in the afternoon. I need not describe them. Such visits might well have been supplemented in the evening by a more pleasant and more *spirituel* reunion.

I must allude to the excursion of the 8th August to the

Works of M. Menier at Noisiel.

During the Exhibition M. Menier has been most hospitable, and the English papers have already chronicled one of his *fêtes*. This visit was an enjoyable one, as the cost was slight, being only 5f. 15c. for the return journey.

We were honoured by the reception of M. Menier *fils*, and I have no doubt he felt an equal degree of the same by our acceptance of his hospitality.

The effect of the speeches at the dinner at the Continental Hotel, on one of our French contemporaries, is well worthy of notice.

M. Blondeau, in the *Progrès Médical* of Aug. 10th, thus feelingly expresses his satisfaction with the sympathetic words of the members of the Congress who dined at the 20f. dinner: "Ces temoignages de devouement et d'ardente amitiè venant de bouches si autorisées apportés par les délégués des differentes nations nous sont particuliérement chers. Ils nous ont montré que nous pouvons toujours, et à juste titre, être fiérs de notre pauvre patrie mutilée et si cruellement éprouvée. Ils ont été pour nos cœurs un baume bienfaisant qui aidera à cicatriser des blessures encore saignantes. Merci aux adhérents étrangers qui ont bien voulu prendre part à notre Congres."

Barristers tell us that claimants for compensation in railway accidents speedily recover after receiving a douceur. Gold is a wonderful antiseptic, hæmostatic, corrective, tonic, and restorative. By means of the Exhibition France has had her revenge; she has bled the foreigners, and if she applies as a cataplasm the American eagles, the English sovereigns, and the German thalers, &c., the "pauvre patrie mutileé" will soon be ready for another campaign. She has a wonderful power of recuperation. The *Comptes Rendus* may be obtained by all associates on payment of 20f. At that price there will be no loss either to purchaser or committee, for they are fully worth the price.

I alluded to the Palace of the Trocadéro as the place of meeting in the afternoon. It has some historic associations connected with it, thus graphically described by the Paris correspondent of the *Globe;*

"The large concert hall and series of *loggia* have echoed again with the voices of the singers who sang of peace and concord, and yet little more than seven years ago the Versailles troops were drawn up in battle array on the same heights, challenging the insurgents who had entrenched themselves within the barracks at the Ecôle Militaire, to an artillery duel. Marshal de MacMahon has sat thoughtfully on his horse amid shot and shell—until almost compelled to move by his staff to a less dangerous point—within a few yards of the place where he stood when he declared that the peaceful and universal industrial competition we call the Exhibition was open. To the left can be seen the famous Bois de Boulogne, the Park of St. Cloud, the cascade and the ruins of the palace, with the frowning old fortress of Mont Valerien, which wrecked the pretty little town of Saint Cloud and pounded the Imperial palace to pieces. To the right lies the Bois de Vincennes, the aqueduct of Arceuil, built in the seventeenth century by order of Marie de Medicis for supplying the fountains and basins of the gardens."

This recalls to mind the German occupation, and the heavy indemnity of milliards which had to be paid. People have often wondered how this large sum was so easily provided. The answer has been that it was supplied by the parsimony and saving habits of the French people, very excellent and commendable qualities, generally supposed to be the characteristic only of Scotchmen. But I am wrong, as your contemporary, the *Sporting Times*, reminds George Augustus Sala for sneering at the Caledonian. "En Ecosse l'hospitalité se donne et ne se vend pas."

In conclusion, to prove that I am not alone in my estimation of French hospitality, a correspondent of that paper has made the following remarks:—"At the present moment even the Parisians don't sell their hospitality, from the fact that there is no such commodity within the walls of Paris."

THE *United Service Gazette* has reason to believe that the Royal Warrant shortly to be issued, relative to the Army Medical Department, will provide for the appointment of surgeons to regiments for the term of five years. Medical officers will thus be made "regimental" again, and one of the chief objections to the "unification" scheme will disappear.

AN outbreak of Asiatic cholera is reported from Sweden. Several cases there have terminated fatally. The Danish Government has immediately taken the necessary precautions.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 4, 1878.

THE THIRTY-SECOND REPORT OF THE COMMISSIONERS IN LUNACY.—THE INCREASE OF INSANITY.

INDEPENDENTLY of the interest usually attached to the subject of lunacy, the increase of insanity among all classes of society should alone induce the journalist to give his careful attention to the Annual Reports that are issued by the Commissioners in Lunacy. Every year these reports become fuller, more perfect, and more instructive. In last year's report a series of new tables was inserted, giving, as regards the patients admitted in 1876, certain classified information as to their occupation or social condition, the assigned causes of their insanity, and the numbers affected with "general paralysis of the insane," and with epilepsy. In the beginning of this year the Commissioners issued to officers of asylums fresh forms of register similar to those circulated in 1876, and they expect to be able to repeat in 1879 and future years the information contained in the special tables which appeared in their Thirty-first Report. In the present Report, of which we now propose to make a careful analysis, there is a good deal of information not previously tabulated. Thus one table shows the numbers, sexes, ages, and condition as to marriage of the whole population in 1871 for the purpose of comparison with a similarly arranged table of the insane that came under treatment in 1876. In another table there is a calculation of the ratios borne by the total insane admissions of 1876 to the total general population, arranged as to sex, age, and condition as to marriage. There is also an account of the number and proportion of admissions where the disease was congenital, and where it showed itself late in life. Special attention has been given to the subject of general paralysis of the insane, and a summary is given of the causes or influences to which this form of mental disorder was attributed in the various cases cited.

We shall, for the present, confine our remarks to the *increase in lunacy*, a subject on which the present Report throws a good deal of light, although it is only by wading carefully through these 300 pages that the extent of that increase can be fully appreciated.

The facts quoted from this report by the general press will by no means confirm the impression which the heading, "Increase in Lunacy," must have conveyed to the minds of their readers. It is merely stated that last year there was an increase in the number of lunatics, but that the amount of this increase has been exceeded in four previous years, namely, 1863-68-69-71. The total number of registered lunatics, idiots, and persons of unsound mind in England and Wales on the 1st January last was 68,538, being an increase of 4,902 on those returned for the 1st Jan., 1877. It is further stated that the large increase of pauper patients in county and borough asylums and their diminished number in licensed houses are in a great measure due to the opening, during the year, of the third asylum for Middlesex at Banstead, and the removal to this and the two other county asylums of Middlesex of patients previously in Metropolitan licensed houses. It is only, however, by studying some of the excellent tables to be found in this Report, as well as the special reports of the condition of many county asylums, that we can form an adequate idea of the extent to which insanity has increased within the last few years. Thus, in the table showing the ratio of lunatics to the population on the 1st Jan. in each of the years 1859-1878, inclusive, we find that while, in 1859, the ratio (per 10,000) of the population was only 18·67, in 1878 it was as high as 27·57, or, in other words, while in 1859 a population of 19,686,701 supplied only 36,762 lunatics, in 1878, when the population was only about five millions more (24,854,397), the number of lunatics had increased from over thirty-six thousand to over sixty-eight thousand (68,538). But what is more ominous and alarming is the gradual and progressive manner in which this increase in lunacy has taken place. Indeed, so progressive has it been, that, if we take the absolute annual increase of lunatics for the last ten years, we shall find that this increase has varied (in round numbers) from 1 to 2,000; while, if we take the relative ratio (*i.e.*, to population) it will be seen that not once has the ratio of one year fallen short of the ratio of the year preceding, but that, on the contrary, the ratio has exactly increased by an unit every third year. Thus, during the last 11 years the ratio per 10,000 of the population has been respectively 23·23, 23·93, 24·31, 24·91, 25·42, 25·82, 26·23, and so on with the rest. Another remarkable fact which these tables disclose is that this increase in lunacy obtains both among private and pauper lunatics, for in the years 1859 and 1878 the absolute number of pauper lunatics was respectively 31,782 and 60,846, and the ratio per 10,000 of the population 16·14 and 24·48 respectively. The absolute number of private lunatics in those years was 4,980 and 7,692, and the ratio to population 2·5 and 3·09 respectively. The increase of lunacy among the poorer classes is shown still better in Table III, where it will be seen that, while

pauperism has been decreasing since 1859, lunacy among paupers has been greatly and steadily increasing, for whilst the percentage of total paupers to population was 4·37 in 1859, and 3·00 in 1878, the ratio of *total pauper lunatics to total paupers* increased from 3·68 in 1859 to 8·13 in the present year. The same fact is discovered in the table which shows the relative increase in the inmates of our various public and private asylums, making, of course, due allowance for the fact that a great many non-pauper lunatics are confined in public asylums or hospitals. Thus, while the number of patients under detention in county and borough asylums has increased from 15,844 in 1859 to 35,523 in 1877, the number of lunatics in our Metropolitan and Provincial licensed houses only increased from 5,016 in 1859 to 5,403 in 1877.

Another proof of the increase of insanity among all classes of the population, but especially among paupers, is the pressure for accommodation that obtains in a large number of the public asylums scattered through England and Wales. In fact, so general is this complaint that the expression "pressure for accommodation" continually meets the eye as we glance through the marginal references of this Blue-book. It would not be an exaggeration to say that one-half of the asylums either are, or will shortly be, unable to meet the demands made upon them. The Denbigh Asylum is full; the Derbyshire Asylum is full; the Essex Asylum is full; the Durham Asylum is so full that in Ward 7 it has been necessary to place beds upon the floor. The asylum at Glamorgan is overcrowded, so is that at Lancaster Moor, so is the Joint Counties Asylum, Abergavenny, so is the Oxford Asylum. At the Notts Asylum 51 applicants for admission have been refused from want of room, and from 40 to 50 patients belonging to the county of Nottingham are now in other asylums. The Salop and Montgomery Asylum continues to be so overcrowded that it has been found necessary to enter into another contract with the authorities of the Macclesfield Asylum for the reception, for one year, of 25 additional patients. There is, moreover, necessity for increased accommodation at the Suffolk Asylum. The asylum at Warwick is more than full; the North Riding of Yorkshire Asylum will soon be full. At Hull further accommodation for the pauper lunatics of the borough is imperatively called for. Several asylums have been recently built or enlarged, several are in course of construction; while at many places which we have not specified all kinds of manœuvres have to be resorted to in order to accommodate the increasing number of applicants.

The reader therefore will acquit us of any exaggeration when we say that the increase of insanity is serious and ominous in the extreme. It is high time that a thorough and systematic inquiry was made into the causes of this increase; and we are surprised that the attention of the Legislature has not been already directed to the subject. If lunacy is to go on increasing at the same rate that it has done during the last twenty years, what a prospect have we to look forward to! And, as we have seen, so arithmetically progressive has this increase been up to the present time that, unless something occurs to check the prevalence of this disease, we may reasonably expect that the ratio of lunatics to population will continue to mount up until it reaches a point too dreadful to contemplate. During the last twenty years the absolute number of lunatics in England and Wales has almost doubled itself; for whilst there were on the 1st January, 1859, over *thirty-six* thousand lunatics, there were in the beginning of this year over *sixty-eight* thousand. Is then our lunatic population to go on increasing at the rate of 32,000 every twenty years, at which rate it will have amounted, sixty years hence, to upwards of 160,000? Is the ratio of total lunatics to population to go on increasing at the rate of 10 per 10,000 every twenty years? It is evident from the above statistics that neither increase of population nor pauperism is at the bottom of this evil. To what causes therefore are we to attribute it? These questions call for an early and decided answer. If a few cases of typhoid fever occur here and there, all possible means are taken to trace it to its source, and to check its further progress. But here is a more terrible and dreaded disease than typhoid fever endemic amongst us, increasing every year, and attacking all classes of the community. Our asylums are even now overcrowded; and everywhere we hear of fresh asylums being built or new wards opened to receive those that are coming and those that have still to come. It is well, therefore, that the Commission in Lunacy intend to repeat next year and future years the information contained in their Thirty-first Report respecting the social condition of the insane, the assigned causes of their insanity, &c. It may, however, be questioned whether there are not already sufficient data to account approximately for this increase of insanity, a question which we shall hereafter have to take into consideration.

THE ARMY MEDICAL DEPARTMENT.

Our contemporary, the *Lancet*, has astonished us. Living in an age of progress, advice from such a source in a retrograde direction, comes upon us not only with surprise but with positive pain, and we have not the slightest doubt every medical officer in the British service will share the same feelings.

We have for years persistently laboured to improve the status and education of the army surgeon; as a first essential, we hailed with satisfaction the system of competitive examination, as it opened out a fair field for talent, and wiped away private interest, favour, and patronage. It weeded out inefficients and afforded a guarantee that the successful candidates were fully qualified to be trusted with the valuable lives of our soldiers. It was supplemented by a special course of training at Netley Hospital, and each regiment was provided with surgeons of experience and ability.

Has it answered? The strongest affirmation may be truthfully and unhesitatingly given to the question. The competitive system has stood the test of years; for efficiency, though not for *numbers*, the British Army Medical Corps may compare with any other civilised nation.

In instituting the scheme, we were only copying the example set us by other countries, as France, Germany, Austria, military powers, whose ambition was to place their armies on a sound sanitary basis. Towards this end these nations recognised the necessity and importance of providing skilled and educated surgeons.

Through causes known to all our readers, the number

of medical officers in the British service has diminished; fresh candidates are not forthcoming to fill up the vacancies, and consequently the medical *cadre* is incomplete.

The history of the Army Medical Department may be briefly told. Through the bungling and blundering either of the combatant executive, or of superior army medical officers, the department has become unpopular with first-class men, who consequently seek other fields for their talent. Promises have been broken, warrants altered, and faith has not been kept with those who have entered the service, and as the inevitable results, we have, dissatisfaction, grievances, and far worse, a lamentable condition of affairs, detrimental not only to the army medical officer, but to the efficiency, welfare, and health of the whole service. The soldier suffers by the present departmental system, and by the scarcity of medical officers. Formerly, when each regiment had its own surgeon, the habits, history, ailments, of every man in the regiment, were known to the medical officer, from the colonel to the drummer-boy.

Malingerers could not exist; the health of his corps was a matter of pride and personal interest, and in the words of a director-general, the regimental surgeon was the soldier's friend, and the commanding officer's councillor." The surgeon then had a home and a position, he was part of a regiment, and its glories fell by a kind of reflection upon him.

Mais nous avons changé tout cela; he is now in a nondescript position; he is with a regiment or dépôt, but not of it; he has no opportunity of learning the history of his patient, as he is changed about from station to station at the whim of the principal medical officer; he has lost his status—he cannot form friendships with his brother officers; he has no personal interest in their ailments; he may be ordered away whilst engaged in treating some case of interest, and has to hand it over to his successor, to the detriment of the patient. The soldier does not gain by this; as an instance, it is currently reported that one officer, who had fractured his leg, during treatment was attended by six different medical officers, not in consultation at one time, but who came in rotation, owing to the evils we are deploring.

The numerous letters from correspondents confirm the accuracy of our remarks, and we believe every intelligent combatant officer will hail with satisfaction the return to the regimental system. After this rapid glance at the present condition of the service, we again return to the competitive system. We have said it has not failed; we assert it should not be superseded. We invoke the assistance of the lay press to resist the proposed innovation as detrimental to the well-being of the army.

The *Lancet* exhibits a complete change of front, the opinions expressed in its back numbers are forgotten, and we have almost a recantation, inspired evidently by a desire to please, not the army officers, but Whitehall officials.

We must briefly analyse the paragraph and the scheme.

The Army Medical Department is unfortunately insufficiently officered. We are all agreed on this point. We know who is to blame for this.

Medical cadets are wanted; they cannot be had, but they must be secured at any cost. The remedy is simple, says the *Lancet:* "Abolish competitive examinations, open your portals to the sweepings of our medical schools, to the lazy, the ignorant, the dissolute who cannot hope to succeed in private practice, to men who having passed through the horrors of an examination for their diplomas and degrees, do not care to grind up for another for the army." We have no doubt the examinations have been "horrors" to the men herein alluded to.

Having thus secured a batch of candidates, the *Lancet* advises us to bribe them with an increase of pay, whilst undergoing probation at Netley, by giving them 7s. 6d. a day as an encouragement for study.

The Netley professors are a pride and honour to the British Medical Service, and we trust their time and talents will never be wasted upon the class of men who, if the suggested system were adopted, would fill the benches of their lecture rooms. The course of training at Netley is of a high class character; it would be unappreciated by cadets who were ignorant of the alphabet and the rudiments of medical science. Under the competitive system, as the *Lancet* says, "the service derived from it the benefit of the selection of the best qualified men," and the professors had a substratum upon which to work—they had minds and men accustomed to study, and who were thus capable of receiving benefit from their lectures.

The *Lancet* gives as a reason for suggesting to Colonel Stanley the abolition of the examination of candidates for admission, "that there is now a better guarrantee that the license represents a fair qualification to practice." We regret we cannot endorse this reason. There are "licences and licenses," and it is patent to all that, owing to the multiplicity of licensing bodies there is at the present time a marked difference in the character of the examinations, and a considerable looseness in that of some of them.

This is admitted by every medical reformer; hence the universal cry for a Conjoint Scheme, which would afford some guarantee of equability of education.

We ask, then, are we to adopt a retrograde policy? In place of providing a higher class army medical officer, as Professor Haughton, of Trinity College, Dublin, lately suggested in our columns, are we to lower the standard? Are we to disregard the experience of such countries as France and Germany, who train up their army medical *elèves* under a system more rigorous and more educational than our present competitive system? Above all, are we to disregard previous experience in the English Medical Service? Was there not at another time a block in the department? Were not candidates wanted?

The high ways and the bye ways were searched, and acting assistant surgeons were picked up; history can tell us the result. It was a most lamentable failure. We trust we shall be the means of stirring up an active resistance to this scheme—

1st, in the interest of the soldier, and 2nd, in the interest of the medical officer.

It is not by a manœuvre of this kind the *cadre* of the Army Medical Department should be filled up. Its efficiency can only be guaranteed by the present competitive system, its popularity secured by a simple measure of justice.

Colonel Stanley must know that there are just grievances to be remedied, apart from sentimental feelings about gold lace or rank, about precedence at mess or on

duty, that the regimental system must be restored for the benefit of the troops, that other ameliorations are absolutely necessary, details of which we cannot now enter on.

The present Army Medical system cannot be bolstered up by the scheme proposed by the *Lancet*. If we wish to have an efficient Army Medical Corps, a body of trained scientific experts such as the late Professor Parkes desired, we must uphold the principle of selection, we must hold out inducements to gain candidates, and when they have entered the service they must have security for the future. Modern warfare has taught and is teaching us the necessity and value of Army Medical Officers.

By a true measure of reform, based on justice, the Army Medical Department may be restored to its former state of popularity and efficiency. Candidates who are both good surgeons and gentlemen, will be forthcoming, as soon as a warrant has been issued on the lines we have indicated. Colonel Stanley has it in his power to rehabilitate the service, and if he sets himself resolutely to the task, he will earn the gratitude, not only of the medical officers, but of the whole army.

PRISON SURGEONS AND APOTHECARIES' IN IRELAND.

We informed our readers last week that delegates of the surgeons of gaols in Ireland, accompanied by a deputation from the Royal College of Surgeons, had waited on the Under Secretary at Dublin Castle, to represent the injustice and inexpediency of the new prison regulation, which imposes on them the dispensing of medicines. The surgeons have also addressed to the Prisons Board the following emphatic yet perfectly reasonable remonstrance :—

Observations on Duties required of the Medical Officers of Prisons, Representing

That a Minute of Instruction from the General Prisons Board was addressed some time back to the governors of several prisons, directing that in future the medicines prescribed by the medical officers shall be compounded by themselves.

That by a great number of the medical officers this order is felt to be a great injustice and a violation of the contract existing with them, established either by distinctly expressed agreement or equally so by long usage ; and a rule which it is impossible to carry out. Very many of the medical officers have not the inclination, leisure, or even the necessary familiarity with details of the general preparation of, and the compounding of, medicines which would be necessary.

That many of the medical officers of prisons enjoy the confidence of the public, securing engagements occupying their time far more usefully and productively than it would be if applied in performing the duties of licentiate apothecary or pharmaceutical chemist.

That while there are a few who have leisure and have hitherto performed such duties and are willing to continue them, possibly others willing to undertake them as new duties, yet there are many who cannot undertake them and who protest in the strongest manner, consistent with respect, against the attempt to force upon them duties which they never contracted for, especially as they cannot resign their appointments without sacrificing the advantages of the pensions attached to them, earned by more or less length of service, and which rights they feel cannot be disturbed by the imposition of new duties. The fifty-ninth section of the new Prisons Act does not forbid the appointment of apothecaries, it only repeals the obligation of appointment. It is now sought to require, from the medical officers, the performance of the apothecaries' duties, though there are apothecaries proper at the present time acting.

That by the new rules now in operation an immense amount of new duty is required, of which the medical officers do not directly complain, though they feel many of them to be irksome if not wholly unnecessary ; but do complain, as a grievous injustice, that there is continued silence as to advanced salaries for those who have hitherto received moderate salaries in consideration of former very much lighter duties, and as to others who have never as yet received *any salary* or been informed of how much, if any, it is proposed to allocate them, notwithstanding that each class of officers has carefully carried out the details of the new rules, only protesting against the proposed addition of the compounding of medicine, which provision has no place in those rules.

There is great force and plain reason in the argument here put forth. Presuming it to be expedient that the gaol surgeon of the future should compound all the medicines, which we altogether deny, there can be no equity in forcing the present surgeons to do so. They have been appointed to do certain duty set forth in the late Act, and, though it is open to the Prisons Board to modify the method of the performance of such duties, it is certainly not open to them to impose new functions which the surgeons would not have undertaken if they had known of them at the time of their appointment. The proposal to disestablish the gaol apothecary is, in our opinion, unwise even if it were not unfair. It is more than doubtful that it would prove economical; it is pretty certain that it would involve much trouble and complication in the making of drug contracts and the providing of a complete pharmacy system for each of the forty Irish gaols ; it is quite certain that the duty would not be as well done by the surgeon, who has no pharmaceutical experience, and may, probably, be in a hurry to fulfil other engagements, as by the apothecary who knows what he is doing and has time to do it. We are confident that, if the Prisons Board consider the matter carefully, they will see the force of these arguments, and rescind the objectionable order.

Notes on Current Topics.

Secret Infanticide.

A few days ago the *Standard* very properly called the attention of its readers to those pernicious influences which account for the abnormal proportion of infant mortality periodically registered by the Registrar-General. We feel sure that the profession will readily endorse the opinion of our contemporary, and will be glad that, through the publicity of the press, the subject will receive the attention it deserves. There are few general practitioners practising among the poorer classes who are not constantly called to almost dying infants, whose disease has been brought on more by neglect than by natural causes. They are morally certain that they are dealing with a disease in which confinement indoors or improper food, narcotics, and slow starvation, have gradually produced the desired effect. They know that in signing the death certificate "atrophy," or "marasmus," or "phthisis,"

they are stating but half the truth ; and, in too many cases, they know that they have only been called in to save the fuss and bother of a coroner's inquest. But they can do nothing. They have no legal proof of what they may consider to be as much infanticide as if the child had been strangled at its birth. Even were it their duty to do so, they are powerless either to prevent the crime or to punish the criminal. Often, too, would they hesitate to hold out an arm to save one of these infants' life, so wretched is its condition, so deplorable are its surroundings, so hopeless are its prospects. No ; the remedy is to be found in other quarters, and we trust that other leading papers will follow the example of our contemporary, and induce the legislature to give some attention to what may be regarded as a very serious social evil.

Dr. H. C. Bartlett, in a letter addressed to the *Standard*, remarks that he has, on previous occasions, directed attention "to some of the more startling instances of infant deaths from starvation, arising from culpable negligence (with or without motive), and also from direct criminal intention —almost confessed in more than one case." He attributes the evil to the inducement held out by "infant burial payments," and the ready means to murder with impunity afforded by many of the so-called infants' foods.

On the subject of infant death assurance we shall express no opinion, but our readers may remember that when, some time ago, an inquiry was made into the excessive infant mortality in one of our largest provincial towns, one of the medical witnesses imputed it in a great measure to the systematic practice of secret infanticide, and to the temptation offered by the burial assurance payments they receive on the death of the infant. With regard to infants' food, we can speak, and have often spoken, more decidedly, for, perhaps, there is not a more pernicious practice, both in the nursery of the rich and in the homes of the poor, than the irregular and haphazard manner in which infants are fed, and the administration of a lot of patent food, of the nutritious qualities of which the parents have no other guarantee than the plausible recommendations of the vendor.

With the view of removing as far as possible the motive above-mentioned, Mr. Bartlett thinks that infant insurance by money payment should be peremptorily stopped. He would permit burial societies to be formed to provide the actual funeral, burial charges, &c., but no money must pass into the hands of the policy holders. Moreover, the scope of the Adulteration of Food and Drugs Act must be extended to take special cognisance of the false pretensions so extensively put forward with regard to "infant's food." "If," says Mr. Bartlett, "plain starch is sold under any fanciful name, and it is stated on the wrapper or by advertisements that it contains 'nitrogenous, flesh and bone-forming properties,' or any such untruthful statement, the vendors should be held liable to the heaviest penalties. Not 'because they cheat but do not poison,' as was said by the Committee of the House of Commons after hearing my evidence on this point, but because the false pretensions so put forward prevent those most anxious to obtain the best food for their infants from being able to discriminate between the good and the bad ; and because those who desire to assure the death of their children do so, almost without a chance of punishment, by the slow starvation of such feeding."

Were the vendors of these objectionable foods to be held liable to a heavy penalty, one cause of infantile disease would be no doubt in a great measure removed ; but unfortunately there are so many other ways in which the health of infants may be undermined, that we must not be too sanguine as to results of any legislative enactments. Nothing short of the education, and the social and moral improvement of the working classes, will strengthen those maternal instincts, and that feeling of moral responsibility upon which the preservation of infant life must at all times chiefly depend. The profession, too, might do something in a preventive point of view by devoting a little more attention to the subject of infant feeding, instead of leaving it, as is too often the case, in the hands of nurses and the proprietors of patent food and medicines.

Neglect of Vaccination in Ireland.

At the last meeting of the Limerick Board of Guardians Mr. Bourke, Local Government Board Inspector, said he wished to bring under the notice of the Guardians the question relative to those people in the city who had failed to comply with the provisions of the Vaccination Act. There were a number of societies in the city who had their medical officers, and who generally vaccinated the children of the members. All persons were not vaccinated by the city dispensary medical officers. These gentlemen were bound to vaccinate all persons applying to them, but a number of other persons in the city, as well as the military, were not vaccinated by dispensary doctors. The result was that it was found some minute regulations would be required, so as to ascertain who were the persons that failed to comply with the law. Lists of defaulters had been published, and it was found that so many as three or four hundred children and others had not been vaccinated. It was also found that in some cases the certificate of vaccination was not given always by the private practitioners to the registrar, and thus a number of anomalies had crept up which it would be very advisable to check. Under these circumstances he thought it would be well to appoint a committee who would lay down a few rules in reference to the vaccination of children in the city.

It is as well to remind Mr. Bourke that the Irish Local Government Board has largely contributed to the neglect of vaccination of which he complains, because its policy has had the effect of discouraging watchfulness on the part of the medical officers. In the first place, the fee of 1s. given for a successful vaccination is altogether insufficient to pay for the trouble of hunting up unvaccinated children, keeping records of births, sending cautionary notices when the period allowed for vaccination has lapsed, and furnishing lists of defaulters to the Guardians. Naturally, the medical officers do not open their eyes very wide to see defaulters. In the second place, the Irish Local Government Board has thrown cold water upon the granting of a fee for attendance at vaccination prosecutions ; and—acting on the hint—the magistrates have recently, in many cases, refused to give the necessary certificate for such fee. The medical officer is not likely to be very zealous in instituting prosecution when he knows that it is likely he will have to travel a distance, lose much time, incur great unpopularity, and get neither money nor thanks.

If the Irish Local Government Board wishes to mend the matter—and it is one which much needs mending—it must first make it worth the while of the medical officer to follow up each unvaccinated child, and to carry the prosecution to a successful issue. It may not be inappropriate to remind the Irish Local Government Board that a Bill, constructed by the Irish Medical Association specially for the purpose of facilitating the detection of default in vaccination and the coercion of the defaulters, has been in the hands of the Chief Secretary, who is the President of the Local Government Board; and that, up to the present, it has been entirely ignored, both by the Minister and by the Board itself.

How Infectious Diseases are Spread.

An inquest has just been held in St. Pancras, which shows how some medical men will neglect to inform the sanitary authorities of any infectious disease which may come under their notice. The patient on whom the inquest was held was a child who died of scarlet fever after three or four days' illness; and it is stated that the parents of the child were not aware of the nature of the complaint until death had taken place. No notice was forwarded to the sanitary authorities of the prevalence of scarlet fever in the house, and the first that Mr. Rouch, the chief inspector of the sanitary department for St. Pancras, heard about it was from a return made by the Registrar-General. He then made inquiries, and found that two other children were also lying in the house in a very dangerous state. He at once had the house disinfected, and measures taken for keeping the fever from spreading in the neighbourhood, which is densely populated, and ordered the other children in the house not to be allowed to attend school. The Coroner very properly remarked that medical men should tell the persons whom they found in charge of patients suffering from infectious diseases that such was the case, and that the persons so told should, under a penalty, inform the sanitary authorities, who would then be able to take the proper remedies for preventing the disease from spreading, thereby saving a good many lives. At present that was not done, and the sanitary authorities did not glean any tidings till several persons had caught the disease.

Need of Medical Men in the Transvaal Republic.

On this subject the correspondent of the *Globe* remarks as fellows:—"Medical men are much wanted out here. A force of 400 mounted volunteers had to patrol a large extent of country near King William's Town, without a doctor accompanying them. At various towns in the Transvaal there are splendid openings for a practice. All doctors coming out here should be able to make upwards of £1,000 per annum the first few years. Their work would consist mainly in riding long distances to visit farmers' families. Large numbers of the Boers come immense distances to the towns of the Transvaal to consult a doctor."

Coincidence or Plagiarism?

It is sometimes wonderful how the same idea occurs to different minds at the same time. It may be a coincidence, or *it may be* what is termed plagiarism.

It is very singular that the Committee of the British Medical Association on Rabies, or Hydrophobia, should have struck out a line of investigation so very closely resembling the method adopted by our own Commissioners. The method, as applied to hydrophobia, was a new one, and hitherto unattempted. Our readers can judge as to the priority of idea. It is a mere trifle as regards any particular honour for the idea, but scientific men should not too faithfully copy without acknowledging the obligation.

British Medical Journal, August 17, 1878.

It has been thought that the only safe means of dealing with the subject was to collect a large number of cases, and to embody them in a condensed form in the report. The conclusions derived from the cases by the reporter and by the Committee will thus be easily checked by the facts themselves, and will acquire a weight which, unfortunately, does not belong to previous investigations.

Medical Press and Circular, October 31st, 1877.

We have, then, collected—

1. As many statements, under the head of hydrophobia, as we deemed sufficiently accurate, in order

2. To compare the statements with each other, and arrange them according to their resemblance or dissimilarity; and

3. To draw general conclusions and inferences which may assist further investigators.

We are arming our readers even against ourselves. . . . But better for medicine that we should be *checked* and corrected than that we should promulgate as facts what are only individual opinions.

Our readers will judge as to the similarity of the method, and as to the resemblance between the two paragraphs. The dates are very clear evidence as to the priority of conception of the line of investigation.

We condensed a large number of cases into our reports. Our conclusions we left to be *checked* by the facts, and the value of the investigations has been decided beyond appeal by the judgment of Sir Joseph Fayrer in the July number of *Brain*.

We wish the Committee success in their work. The method they have adopted is a good one, though borrowed, and, as we expect some original researches, we can afford to be generous.

The announcement as to the bibliographical portion of the reports is very interesting, though it is the least practical and easiest part of the task, for the material is already prepared by others. We are reminded, as regards this compilation, of the sins of the Abbé Trublet—

Au peu d'esprit, que le bon homme avait
L'esprit d'autru par supplement servait,
Il compilait, compilait, compilait;
On le voyait sans cesse ecrire, ecrire,
Ce qu'il avait, jamais entendu dire,
Et nous lassait sans jamais se lasser.

Medical Men in the House of Commons.

A contemporary says:—"It is understood that the medical profession are determined to have, if possible, a large number of representatives in the House of Commons at the next general election. Medical men complain that at present they are almost entirely without representation,

while the Bar, the railway interest, trade, commerce, and all the other interests have numberless spokesmen in Parliament. Dr. Andrew Clark it is said, will be urged to stand for the University of London. Sir Henry Thompson is also spoken of as a probable candidate for a seat."

Public Mortuaries.

INQUESTS are generally held at public houses, not through choice, but necessity. When a body is found, it is removed to the nearest public house, where there is generally no proper accommodation for the purpose.

It is placed in some outhouse, and coroners could tell us of some sad incidents happening to the dead under such circumstances, as injury from rats, &c. There are other dangers in connection with the use of public houses. It is quite possible that a body brought into one, may become a source of infection or contagion. We need not elaborate arguments against the present system. It is admitted that a remedy is wanting. It can be easily provided, by building public mortuaries. In some parts of London they are already in existence, and the example set by London should be copied in our provincial towns. They are a necessity, and medical officers of health should impress upon their boards, the importance of providing them. They might be used with advantage, not only for the purpose of the Coroner's Court, but as a receptacle for patients who have died of some infectious or contagious disease. Speedy burial is in all such cases desirable, but is not always possible. Many houses have not a spare room for the dead, and the ordinary living and sleeping room is used for the purpose. The evil is patent, the remedy simple.

Provident Dispensaries.

THE evidence as to the value of these institutions is very conflicting, as may be seen from the report of the sub-committee on the working of the provident dispensary system in Manchester. We are all agreed there is much need for out-door hospital reform, and that the wants of the poorer classes of the community must be supplied without injury to them or their medical attendant.

The feeling in Manchester is divided. We are told that general practitioners whose work lies in the neighbourhood of such dispensaries say their practice has been injured by them. One gentleman writes :—

"The instinct of self-preservation compelled me to cut my connection with the provident dispensaries. . . . . Our pay was most paltry and our work very considerable."

Dr. Watson says :—"I am convinced, instead of lessening hospital abuse, it was merely opening another and wider door . . . so many availing themselves of the charity for which it was never intended."

We agree with the conclusion of the report : "If the public and profession will lay themselves out to make the administration of medical aid to the poor satisfactory they can do so, but neither section of the community can act alone." At present the lay public expects too much from the profession. Hence the failure of this scheme.

Poor Relief in Ireland.

IN the Annual Reports of the Irish Local Government Board, dated 1876 and 1877 respectively, a decrease is noticed in the average daily number of workhouse inmates for two years in succession.

In the Report for 1878, just issued, a change is reported in the other direction, the average daily number being 1,441 more than in the preceding year. The comparison shown by the latest weekly return with the return at the corresponding period of last year is still more adverse, being in excess thereof by 4,277, the difference between 47,425 inmates in 1877 and 51,702 in 1878.

The out-door relief lists at the same periods show an average daily number of 33,547, in comparison with 31,600 in the previous year, and on the latest return an increase of 3,210 over the number in the corresponding return of last year. This fluctuation in the number of persons relieved by admission to the workhouse or otherwise, is perhaps no more than might have been expected from the indifferent harvest of 1877, and the inclemency and wetness of the subsequent season. Since the commencement of the present improved spring weather the increase of the weekly admissions to the workouse has been arrested, and the gradual decrease of number usually commencing at the end of February in each year has set in as heretofore.

On the last Saturday of February the total number of persons receiving relief out of the workhouse under the 1st section has increased from 32,429 to 35,535, a difference of 3,106, including an increase of 1,169 in the class of "permanently disabled," of 1,131 in the class of "widows with two or more legitimate children," and of 806 in the class of "persons disabled by severe sickness or serious accident."

Cure of Sciatica by Subcutaneous Injections of Ether.

DR. C. G. COMEGGS, lecturer on Clinical Medicine, Cincinnati Hospital, has found this treatment successful in an obstinate case of sciatica. The patient could not walk without a crutch, and suffered great pain with every effort to use the left leg. His health had become injuriously affected by the opium which, along with other medicines he had been taking, he had no appetite, and his bowels were excessively constipated. The spine had a curvature causing a projection of the left hip, the result of an effort to favour the suffering nerve. Fifteen drops of ether were administered hypodermically. The morphine he was in the habit of using was stopped, and 20 gr. of chloral given to secure sleep. The injection up to 30 drops was repeated, morning and evening for three days, when he was allowed to go home. In the meanwhile, he had begun to walk about the city, to try himself, as he said, for he was very reluctant to believe that he had been so readily cured. The injection was made behind the great trochanter. He had a liberal allowance of beef-tea and whisky while under treatment.

THE Hospital for Sick Children, Great Ormond Street, has been promised the proceeds of the first *matinée* performance at the Gaiety Theatre next

Treatment of Purulent Ophthalmia.

IN a paper read before the Ohio State Medical Society Xenophon Scott says, the treatment of this disease should consist of perfect cleanliness; the application of a solution of nitrate of silver (10 or 15 grs. to the ounce); cold ice compresses; scarifications and cold compresses after (and not before) cauterisation; incision with scissors of swollen conjunctiva, when over-lapping the cornea; leeches to the temple; and, when the cornea is attacked the application of a solution of atropia, with paracentesis of the membrane, if necessary. With regard to compresses, he advises them to be dipped in ice water, continually applied, and frequently replaced as soon as they become the least warm; but when the swelling and congestion of the conjunctivæ have diminished, it is not necessary to continue them more than an hour or two at a time. Scarifying the ocular conjunctiva, especially that overlapping the cornea, is an important adjunct to the treatment. They should be superficial, and made immediately after the cauterisations.

Ordeal of Poison.

THE following case, recorded in the report of the Chemical Analyst for Bombay, 1877, indicates that the practice of ordeal by means of poison still lingers in India. A man lost some ornaments, and suspected his sister of stealing them. Under the advice of a "wise man," he put outside his door a copper pot with a lump of cow-dung in it, advertising his friends that he had done so, and that, if the thief put the ornaments into the pot, nothing further would be said. This failed. The wise man, therefore, assembled the neighbours, and an ordeal was instituted, each person being required to eat a small quantity of sugar. The result was that the sister died with symptoms of irritant poisoning, and that a grain and a half of arsenious oxide was found in the contents of her stomach.

The Chinese Government and Opium Smoking.

A RECENT edict of the Chinese Government speaks of the people as foolish, coveting wealth, and forgetful of the injury that is being done by the cultivation of the poppy instead of cereals, and it enacts that for the future the cultivation of the noxious drug must cease; disobedience thereto to be visited with severe punishment. This edict applies to the whole of China. The district magistrate of Tientsin has personally visited the opium-smoking resorts, and closed them all. Soldiers and officials are strictly prohibited from smoking, under heavy penalties.

The Mortality in Dublin.

THE week which ended on the 24th of August seems to have been exceptionally healthy everywhere but in Dublin. In Edinburgh the ratio was only 17·3 per 1,000 of the population, in Glasgow 19·4, and in London 20·9, while in Dublin it was 26! and this in spite of a considerable reduction in the number of small-pox cases. The Public Health Committee of the Corporation is prostrate from its labours, and the small-pox gets along at its own pace uninterfered with by any official zeal.

The British Medical Journal says: "It is decidedly inconsistent with strict professional propriety that a licentiate of the King and Queen's College of Physicians in Ireland should see patients, on market days, in the shop of a chemist or druggist (not far from his own house) who pursues counter-practice and visits patients at their homes. The circumstances of the case should be represented to the authorities of the College to which the practitioner in question belongs. Our contemporary hardly does justice to the offence of the person in question when it describes it mildly as "inconsistent with strict professional propriety." We should have said "inconsistent with the most elementary idea of common decency, disreputable, and contemptible." It is deserving the consideration of the Fellows of the College of Physicians whether this line of trade comes within the limit which entitles them to cancel the diploma of the "gentleman" physician referred to.

THE *Students' Journal* says that "in spite of the raised fees for medical education, which some thought would deter a few from joining the profession, the number of entries for the next preliminary examination of the London College of Surgeons is even larger than usual. It will be interesting to learn, when October arrives, whether a smaller or larger average of students join the hospitals, and whether the average is smaller at those metropolitan hospitals where the fees have been raised; and in that case, has the average of the other schools in the United Kingdom been larger in consequence?"

AS an instance of the carelessness with which death certificates are sometimes given may be mentioned that of the death of an excavator, aged 36 years, at 56 Campbell Road, Islington, who died on Aug. 11th, which was certified by a registered medical practitioner as the result of "phthisis, 8 months, cerebral effusion;" an inquest was, however, subsequently held, and after a *post-mortem* examination the verdict was "injury to brain, and fracture of skull by falling from a wagon." Such ignorance, if it be not something worse, deserves almost the cancelling of the offender's certificate, whose name we, in charity, forbear to mention.

WITH few exceptions, the health of the large cities throughout the United Kingdom continues to be satisfactory. The mortality in London, Edinburgh, Glasgow, Bristol, &c., is particularly low, ranging from 17 to 21 per 1,000 of the population. Dublin, Manchester, Sheffield, Leeds, and Plymouth, are second on the list, whilst Salford, Liverpool, Birmingham, Leicester, Newcastle, Norwich, and Hull have a very high death-rate, the two latter showing a percentage of 39 and 40 in the 1,000.

A FEVER epidemic is raging in North Derbyshire, particularly surrounding Chesterfield. All the schools have been closed at Dronfield by order of the authorities, and it is intended to adopt a similar course at Clay Cross, at which place no less than twenty deaths have occurred within a very short space of time.

THE Honiton Town Council which has resisted the orders of the Local Government Board with regard to the water supply of their town, has had another meeting, at which a final decision was arrived at, that the present supply was adequate, and that the pressure of the Local Government Board be resisted. It is anticipated that the Local Government Board will now take the water supply in hand themselves and charge the town with the cost.

NEXT Saturday collections will be made throughout the metropolis on behalf of the Hospital Saturday Fund. The media will be by boxes in the principle thoroughfares, presided over by ladies or other volunteers.

Correspondence.

CORONERS' MEDICAL WITNESSES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the report of the proceedings for the past year of the Irish Medical Association, as published in your journal, I just now observe the following statement: "A complaint having been made to your Council that on the 9th July (last year) an inquest was held at which the coroner who held the inquest employed as medical witness a practitioner who resided over twenty miles from the place where the inquest was held and where the death occurred, your Council adopted a resolution detailing the circumstances reported, and requested the coroner would offer any explanation he thought fit as to his action, to which the coroner replied in a very unsatisfactory manner."

In a spirit of courtesy towards my fellow members of the Irish Medical Association, and to give them the opportunity of judging whether my letter in reference to the above "complaint" deserved the epithet of "very unsatisfactory," I will briefly and truthfully lay the facts before your readers.

On the morning of July 9, 1877, I received by post a police report from a village in the county, in which village I had never been, as it is situated in the district of my brother coroner; the latter being from home, the duty devolved on me to hold the inquest. The police report stated that a poor man, apparently in good health, went to bed in a lodging house in the village on the night of 7th inst., was found dead in his bed early on following morning. Deceased had not been attended by any doctor, nor had any doctor seen his dead body.

It was evident that a corpse lying beneath a sultry July sun in a small lodging house from night of 7th July should not meet with any delay in its interment. On morning of that day I was requested by the friends of a sick person to meet a neighbouring practitioner in consultation; the consultation being ended, and all the necessary attention and directions having been devoted to our patient, I then addressed my medical friend in these words: "I am now off to a distant part of the county with whose topography I am not well acquainted, to hold an inquest; it is situated in the district of my brother coroner, now absent, but I believe it forms portion of the district of a doctor, who some few years ago (when under similar circumstances I was officiating for another coroner) was summoned by me in due form to attend as medical witness at an inquest. The early receipt of the police report on that occasion, as well as the fact of Sunday intervening, enabled me to give early notice to the medical witness—the latter received the summons on the morning of the day on which I held the inquest. Although I waited for a long time at the inquest, until the arrival of a policeman, whom I despatched to the residence of the medical witness to say I was waiting for him, I was nevertheless at great inconvenience obliged to hold the inquest without him. The policeman whom I sent for the doctor informed me that the latter was in the village. Notwithstanding all this, I never either verbally or by letter received from said doctor any explanation to account for his absence till some days afterwards, when I casually met him, and when in truth his explanation in accounting for his absence, whilst he admitted having received the summons in due time, was eminently unsatisfactory. Under these circumstances, and as I may be disappointed in getting a medical witness, I will ask you to accompany me." He did so, and on our arrival at the place of inquest I at once asked who was the doctor of the district; I was told, "the doctor is away on leave, and it is uncertain if the gentleman who is acting for him is now at home."

The owner of the lodging house being most anxious to have the dead body removed at once from her house, I directed the doctor who accompanied me to make the autopsy. On August 3rd my attention was called to the "complaint" as above quoted by the Council of the Irish Medical Association. I at once replied, stating the facts as already detailed by me, and courteously adding that I held in great respect the Irish Medical Association in their gratuitous efforts to redress the grievances of Irish Poor-law medical officers, and that I would be very anxious to see a definite judicial ruling on the interpretation of the words "at or near," but that an eminent lawyer, an ex-Lord Chancellor, gave it as his opinion that a coroner could exercise a discretionary power in the summoning of any particular witness.

Had I not been engaged as a witness in one of the superior Courts during the day on which the Irish Medical Association held its last annual meeting in the College of Surgeons, I would have laid before those then present at the appropriate time the facts above detailed; and now, Sir, I respectfully submit that the Council of the Association with my explanatory letter before them had not sufficient grounds for stating that I treated their remonstrance in a "very unsatisfactory manner.

I am, &c.,

THE CORONER
who presided at the inquest on 9th July, 1877, alluded to in the Annual Report of the Irish Medical Association.

MEDICAL REFEREES' FEES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—It may—as it did me—astonish you and your readers that there are medical men who examine lives for insurance for the sum of one shilling each. Here are the grounds on which I make this statement: I was presented a few days ago by a respectable man in my neighbourhood, a printed insurance form to fill up by answering the several queries in it, and to do which I should make a most careful medical examination of the party named in the form. On inquiring from whom I was to receive my fee, I was told the agent said that the fee he gave was one shilling, but he supposed the agent meant a guinea. Without proceeding further, I wrote at once to the agent in Dublin, and I quote from his reply the following:—

"I beg to state the —— Society allows but one shilling for every proposal filled in by a medical practitioner. Our office is a Friendly Society, and consequently cannot assure for large sums. Our medical referees accept the fees as above."

I need not say I declined to accept "their fee." I will now, sir, leave to your more ready pen to comment on the conduct of any qualified medical man receiving as a fee the sum of *one* shilling for services which should exhibit medical skill and professional responsibility.

Your obedient servant,

FRANK J. DAVYS, F.R.C.S.I. &c.,

Cremona, Swords.

THE ALLEGED VIVISECTION IN BAYSWATER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your impression of August 28th, the statement of the case is not clear, therefore a few words seem to be necessary to put me right with your readers.

1st. The dog which I saw, not dead, but dying, was in Burlington Road, Bayswater. It had received its death-blow from a gentleman living opposite. It had been operated on, as I saw well, by the removal of a large piece of skin, a clean square cut by a neat operator, so as to expose the flesh. This was seen and remarked upon by many persons, and I have since heard a good deal about the experiment which was performed. But this not having personally seen, I must leave to the eye-witnesses of the operation to relate, contenting myself with describing what I saw. A policeman was present, and

took charge of the dog, but a gentleman among the crowd went to the police station, and reported the case immediately. He was told to "mind his own business." See a lady's letter in the *Bayswater Chronicle* of August 24.

The case which the Home Secretary describes, was quite different. It was a dog run over in Gloucester Crescent, Bayswater, half a mile from Burlington Road. A lady whom I know, saw the occurrence in the daytime, whereas the case I saw was at night. If required, I have no doubt forty witnesses might be found, and among them, probably some who actually saw the first stage of this case of cruelty.

Yours, &c.,

C. O. GROOM NAPIER.

18 Elgin Road, St. Peter's Park, W.
August 29.

[We do not wish to argue the question with our correspondent, but we may remind him that the appearance of the wound which he describes, was no proof that it was deliberately inflicted by a vivisector. Any surgeon will tell him that a wound occasioned accidentally, will often have the appearance of one that has been made by some sharp instrument. If our correspondent can prove the correctness of the statement he first made, we should be the last to screen those who were guilty of the cruelty of which he complains.—ED. M. P. & C.]

PHYSICIANS' FEES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Several letters have lately appeared in the *Times* newspaper regarding excessive fees charged by medical men to patients. I enclose you a tariff of my scale of fees for the last twenty years, which I either give to my patients at the outset of consultation, or cause the small printed papers to be laid on my waiting-room table to be taken away before consulting me, leaving patients free. The result is no grumbling. We must remember the profession is a noble and liberal one, and should be so used by all who profess it, otherwise it is a despicable trade if exercised for money-squeezing of the sick.

Yours truly,

A PHYSICIAN.

London, August 28th, 1878.

The memorandum to which our correspondent refers is as follows :—

Medical Fees Within the Four-mile Radius of London.

Single consultation or visit by day, one guinea.
Frequent consultations or visits by day, half-a-guinea.
Consultations or visits by night, one guinea.
Frequent consultations or visits by day to two or more of the same family, each person, seven shillings.
Frequent consultations or visits by night to two or more of the same family, each person, half-a-guinea.
Servants as by agreement.
Distant consultations, or visits in the country, the customary physician's charge.

Literature.

APHASIA AND ATAXIA OF SYPHILITIC ORIGIN. (a)

"WHY should anyone refuse to syphilis the possibility of producing locomotor ataxia?"

Dr. Drysdale has published in a pamphlet of fifteen pages an outline of his views upon this subject, prefacing his remarks with the details of four cases, typical of the different varieties of cases which he has met with in his hospital and private practice.

The great majority of classical writers upon the subject of locomotor ataxy have passed over in silence, either intentionally or inadvertently, the possible connection between a syphilitic history and this disease. Some, indeed, admit the possibility of such a connection as cause and effect, but few or none lay any stress upon it.

Without being dogmatic upon the point, Dr. Drysdale brings into prominence the frequent existence of a syphilitic history in such cases, and believes there is plenty of room for further study upon the matter.

The possibility of specific disease being the cause of loco motor ataxia—a disease usually considered hopeless—open to treatment by specific remedies, is well worthy of consideration, since it affords some hope of being able to combat a form of disease hitherto looked upon as a reproach to the science or art of medicine.

We cordially recommend to our readers a careful perusal of Dr. Drysdale's pamphlet.

(a) "Aphasia and Ataxia of Syphilitic Origin." Being the Substance of a paper read at the Medical Society of London, March, 1878, by C. R. Drysdale, M.D. Published by Bailliére, Tindall, and Cox, 20 King William Street, Strand, London.

FOWNES' MANUAL OF CHEMISTRY. (a)

IF any evidence were wanted of the development of chemistry within the last decade, we need not go further than the growth in size of many established works upon this science, as they appeared in consecutive editions. The consideration which naturally presents itself to the reviewer, is how far is this elaboration desirable for the requirements of the readers of a "Manual of Chemistry for the use of Students." That there is a limit, there can be little doubt.

Fownes' Manual is a striking example of this development of good books. Originally, a one-volume book of some six or seven hundred pages, it has passed through eleven editions since the death of its author, owing to the well-merited success of the first edition It was adopted as a text-book by Dr. Hofmann, when professor at the then styled College of Chemistry. This fact in itself was no small testimony to its worth, and it was extensively elaborated under that Professor's editorship. On his retiring from the scene of his London labours, we find the work handed over to the fostering care of Mr. Watts. If Mr. Watts is not a practical man, his Dictionary of Chemistry has stamped him as the most successful collator in any science that we have; under his auspicies we find Fownes' Manual has developed into two volumes, the second of which is devoted to Organic Chemistry.

In the second volume, the one now under review, the more modern, and at any rate the more rational, definition of *organic* chemistry is of course taken. The arrangement is simply based upon an arbitrary idea that carbon being the chief element in certain complex compounds, including those generally found in the organic world, the combination of that element with hydrogen gives rise to certain series of hydrocarbons, which in combination with other molecules, produce a kaleidoscopic-like variety of compounds to which there is no end. In fact, that the organic chemistry of the present epoch, is the chemistry of the carbon compounds. What will organic chemistry be in the twentieth century? and what will the chemical student of that century be? Will each element be treated as a special branch of science, and have its specialist? Why not?

The old idea of an organic compound, being formed by some inherent force, capable of building up in the laboratory of Nature compounds which could not be put together synthetically in the chemical laboratory, is a thing of the past. What is done in the natural laboratory has long been surpassed by the constructive tendency of the scientific chemist, who works by the aid of chemical laws, which he finds are quite sufficient without seeking for vital force.

Mr. Watts, from his comprehensive insight into modern research, has succeeded in placing before the student the difficult subject of organic chemistry as far as it has gone, in a very clear light. The subject of classification, however, as regards this subject, is only in its infancy, owing to the difficulty of seeing into the innermost structure of these organic molecules. We are still a long way off that condition of things chemical—mentioned by Carlyle—when they shall have "become transparent to you, so that you can survey them on all sides."

In the preface the editor states that the classical researches of Kœrner and others amongst the isomeric relations of the derivations of benzene, are presented in a form in which they have not yet appeared in any English dress; and the editor omits the physiological portion, this department of "Organic

(a) "Fownes' Manual of Chemistry." Vol. ii. Chemistry of Carbon, Compounds, or Organic Chemistry. 12th edition, revised and enlarged. By Henry Watts, B.A., F.R.S.

Chemistry" being already so extensive as to require separate treatises.

It is really curious to observe what a small proportion of the "Organic Chemistry" is devoted to the consideration of products directly derived from the vegetable or animal world.

Literary Notes and Gossip.

DR. MAUDSLEY contributes a paper to the current number of the *Fortnightly Review* "On the Hallucinations of the Senses."

* * *

A NEW edition of Cooke's well-known "Tablets of Anatomy, Physiology," &c., is, we hear, in the press, forming two volumes instead of one, as formerly issued. The author has given some additional subjects.

* * *

DR. B. W. RICHARDSON is engaged upon a paper treating of "Ether Drinking and other Extra-Alcoholic Modes of Intoxication," which is to make its first appearance in an early number of the *Gentleman's Magazine*,

* * *

ANOTHER volume of Zeimssen's splendid "Cyclopædia of Medicine" has just appeared. This volume (xiii) is principally the work of Professor Erb, of Heidelberg, translated by Dr. Geoghegan, and is occupied solely with Diseases of the Spinal Cord and Medulla Oblongata.

* * *

MUCH surprise has been created in literary circles by the simultaneous failure, during the past few days, of three well-known London publishing houses, with liabilities to an enormous extent. Messrs. Virtue and Co. were the first to go, one creditor alone claiming over £40,000. With them followed Messrs. Daldy, Isbister, and Co., and Messrs. Tinsley Brothers, who were involved with the first-named firm. Other houses are said to be "shaky," as publishing has not been a very profitable speculation of late.

* * *

THE *Medical Examiner* is, we hear, "on its last legs." The *Student's Journal* announces that it has already succumbed for want of support, but this, we believe, is somewhat premature. The last numbers have appeared two or three days after date, and each is said to be the last. This journal has struggled hard for existence for more than two years, and its proprietors have sunk over £4,000 in the venture. The profession is, however, overloaded with journals, and our moribund contemporary adds another to the long list to prove that medicine is sufficiently represented by the older media.

* * *

THE past month, like its predecessor, has not been pregnant with many new books in medical literature. Playfair's "Midwifery" (2nd edition), Kidd's "Laws of Therapeutics," Hunter's "Mechanical Dentistry," Ziemssen's "Cyclopædia of Medicine" (vol. xiii.), Baldwin Latham's "Sanitary Engineering," Semple's "Aids to Chemistry" (2nd edition), Startin's "Ringworm," Godlee's "Atlas of Human Anatomy," part vi., and Holmes's "Botanical Note-book" were the only issues during August. There are a few important works announced or expected in September and October, but these will be noticed anon.

* * *

ANNOUNCEMENTS for the coming publishing season are not so numerous as usual. We have new editions of two large works on surgery promised, viz., "Gant's Surgery," which will be nearly double its former size, and contain about 1,000 illustrations, and Holmes's smaller "Surgery" (1 vol.) Neither of these books were particularly successful as originally issued, but report has it that very strenuous endeavours have been made to ensure success with the new ventures, Mr. Gant having enlisted the valuable assistance of several leading London surgeons, in order to render his work as complete as possible upon special branches. A new clinical manual, by Scotch authors, and a few smaller works are announced, but we shall probably have to wait for the students' numbers of the journals for the complete lits of forthcoming works.

Medical News.

The Medical Colleges and Schools.

ST. GEORGE'S HOSPITAL.—Sessions 1877-78.—The following medals and prizes have been awarded to successful students at this school.—The William Brown £100 Exhibition, G. R. Turner. The William Brown £40 Exhibition, held by Mr. Dunbar. The Brackenbury Prize in Medicine, A. Shann. The Brackenbury Prize in Surgery, F. Wadham. Sir Charles Clarke's, Mr. Warwick. The Brodie Prize in Surgery, F. Wadham. Dr. Acland's Prize, G. H. Cowburn. The Henry Charles Johnson, C. A. Weber. The Treasurers', A. Shann. The Thompson Medal, F. Wadham. Third Years' Proficiency, C. A. Weber. First Years' Proficiency, A. K. Willis.

KING'S COLLEGE.—Winter Session.—Prizes. Anatomy.—John Phillips and William George Evans. Chemistry.—Robert Hoggan and Simpson Powell, Prizes. Medicine.—James Balls, Prize. Clinical Medicine.—James Balls, Prize. Surgery.—Arthur Lofthouse, Prize. Clinical Surgery.—Thomas Furze Clarke, Percy Close, Prizes. Practical Biology.—Walter Frank Weldon, Prize. Hine.

NOTICES TO CORRESPONDENTS.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

DR. KNAPP, Wyoming, U.S.A.—Thanks for your appreciative letter. Our best endeavours will be directed towards keeping the journal up to the high standard you have formed of it.

A CANDIDATE will find Gant's little guide "For the Fellowship and Membership of the College" very useful.

AN INQUIRER.—The journal is now defunct.

A FORMER STUDENT.—There have been few changes in the staff since the date mentioned; it is virtually the same as when you left it for the colonies.

J. D. M.—Our contemporary must have mistaken your question. The reverse is the case.

A NOVEL PURSE.—A curious specimen of the inventor's ingenuity has just been brought out. It consists of a somewhat bulky looking purse, the size of an ordinary cigar-case, one compartment of which contains a five-chambered revolver, which can easily be fired by pressing a spring without opening the purse. It is intended as a handy means of self-defence against highway robbery.

DR. BOURNEVILLE. Paris.—With pleasure.

DR. MCN., India.—Communication received, and shall appear. Subscription paid up to July 1, 1877, by relative in Dublin. Now due to July 1, 1878, which will be furnished to same person.

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Goodridge, Bath. Prof. Charcot, Paris. Mr. Downes, Dublin. Mr. Haynes Walton, London. Dr. Grailly Hewitt, London. Dr. Knapp, Wyoming, America. Mr. Greenway, Plymouth. Dr. Wyld, London. Dr. Paley, Bishopton Grange. Mr. Scaife, Scarborough. Dr. Burder, Bristol. Mr. Browne, London. Mr. Hay, Hull. Dr. Leadman, Manchester. Dr. Edward Moore, Middlebury, South Africa. Dr. Robertson, Glasgow. Dr. Thomas, Birmingham. Dr. Nicholson, Manchester. Dr. Moore, London. Dr. Barclay, Bethnal Green. VACANCIES.

Birmingham Queen's College.—Medical Tutor. Salary, £125. And a Professor of Comparative Anatomy. Applicants must address the Secretary on or before September 12.

Brown Sanitary Institution. Professor Superintendent. Salary attached, £300 per annum, with residence and an assistant. (See Advt.)

East London Hospital for Children.—Clinical Assistant. Board and lodgings provided, but no salary. (See Advt.)

Essex and Colchester Hospital.—House Surgeon and Apothecary. Salary, £100, with board and lodging. Applications, with testimonials, to the Committee by September 12.

General Infirmary, Leeds.—House Surgeon. Salary, £100, with board and residence. Applications, with testimonials, to Dr. Heaton, at the Infirmary, by September 12.

Lincoln County Hospital.—House Surgeon. Salary, £100, with board and lodging. Applications, with testimonials, to the Secretary by September 23.

Manchester Royal Infirmary and Lunatic Hospital.—Honorary Assistant Physician. Applications to the Chairman of the Board.

Mercer's Hospital.—Resident Medical Officer. Salary, £50, with allowances. (See Advt.)

Naas Union, Blessington and Ballymore Dispensary District.—Medical Officer. Salary, £125. Election, September 10.

Sheffield Public Hospital.—Assistant House Surgeon. Salary, £65, with board and lodgings. Applications to the Hon. Sec. at 221 Glossop Road.

Royal College of Surgeons, Ireland.—Six Examiners for the Diploma in Dental Surgery. (See Advt.)

APPOINTMENTS.

BARK, J., L.K.Q.C.P.I., M.R.C.S.E., Medical Officer for the Kirkdale District of the West Derby Union.

BURNIE, Mr. W. G., House Surgeon to the Children's Hospital, Dyke Road, Brighton.

BUTTERFIELD, H., M.R.C.S.E., L.S.A.L., re-appointed Medical Officer of Health for the Bradford, Yorkshire Urban Sanitary District.

CANT, W. E., F.R.C.S.E., L.R.C.P.L., Resident Medical Officer to the Royal Albert Hospital, Devonport.

CLARK, W. W., M.D., M.R.C.S.E., L.S.A.L., re-appointed Medical Officer of Health for the Wellingborough Urban Sanitary District.

CLOUSTON, C., M.B., C.M., Medical Officer of Health for the Hay Urban Sanitary District Brecknockshire.

CUTHBERTSON, J. M., L.F.P.S.G., Medical Officer, &c., for the Droitwich District of the Droitwich Union, Worcestershire.

DALTON, F. G., M.R.C.S.E. & L.M., L.S.A.L., Medical Officer for the Ogley-Hay District of the Lichfield Union.

DAVIES, J., M.R.C.S.E., Medical Officer for the Llanbrynmair District of the Machynlleth Union.

DAWSON, E., L.F.P.S.G. & L.M., L.S.A.L., Medical Officer of Health for the Bocking Sub-district of the Braintree Rural Sanitary District.

DODDS, W. J., M.B., D.Sc., Assistant Medical Officer to the Royal Lunatic Asylum, Montrose.

EVANS, Mr. J. W., House Surgeon to the County and County of the Borough of Carmarthen Infirmary.

FISHER, F. R., F.R.C.S., Surgeon to the Surgical Aid Society.

FLANNERY, J. G., L.R.C.S.I., L.K.Q.C.P.I., Medical Attendant to the Royal Irish Constabulary, Ballycroy, co. Mayo.

FRY, J. F., L.R.C.P.L., M.R.C.S.E., Medical Officer (for Out-door Patients) to the Swansea Hospital.

JONES, W. L., L.R.C.P.Ed., Medical Officer of Health for the Llandilofawr Rural Sanitary District, Carmarthenshire.

KENNEDY, Mr. H., Assistant Surgeon to the Mater Misericordiæ Hospital, Dublin.

MCDOWELL, C. W., M.B., F.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Carlograigne, Queen's County.

MCDOWELL, F. V., L.R.C.S.I., Medical Officer to the Baltinglass Dispensary District, Baltinglass Union.

MOWAT, G., M.R.C.P.Ed., Physician to the Swansea Hospital.

OULTON, H. W., M.D., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Doonane, Queen's County.

PADLEY, G., L.R.C.P.L., Consulting Physician to the Swansea Hospital, upon resigning as Physician.

REES, D. V., L.R.C.P.L., M.R.C.S.E., Medical Officer, &c., for the Carmarthen District and the Workhouse of the Carmarthen Union.

Births.

ELMES.—July 10, at the Royal Naval Hospital, Mount Stradwell, Hong Kong, the wife of W. H. Elmes, Surgeon, Royal Navy, of a daughter.

LORD.—August 26, at Woodford, Armagh, the wife of R. G. Lord, M.D., Deputy Surgeon-General, Indian Medical Department, of a son.

PARROTT.—August 25, at Hayes, Middlesex, Edward J. Parrott, M.R.C.S., of a daughter.

WHITE.—August 29, at Blackrock, the wife of Surgeon H. P. Esmonde White, Indian Medical Service, of a son.

Marriages.

CRICHTON—UNWIN.—August 28, at St. Mathew's, Surbiton, G. Crichton, M.A., M.B., of Twickenham, to Agnes, daughter of the late J. Ragget Unwin, F.R.C.S., of Brixton.

BROWN—HENDERSON.—August 29, at St. Mary's Church, Scarborough, J. Murdoch Brown, M.B.Edin., to Annie, daughter of J. H. Henderson, Woodlands, Sheffield.

HARMAN—SKEFFINGTON.—August 22, at Ilfracombe, Rodolphe Harman, M.B., Staff Surgeon, to Ada Blenerhassett, fifth daughter of the Hon. Chichester T. Skeffington, co. Antrim.

WESTROPP—GRESHAM.—August 29, at Dublin, Cecil G. Westropp, L.R.C.S.I., &c., &c., of Ardcanny, co. Limerick, to Elizabeth, eldest daughter of the late William H. Gresham, Esq., of Raheny Park, and 8 Merrion Square South, Dublin.

Deaths.

ARSCOTT.—On August 19, at Exeter, Robert Arscott, M.R.C.S.E., aged 76.

BURN.—On August 24, at Fernie Knowe, Budleigh Salterton, William Hewitt Seton Burn, late Surgeon-General, Madras Army, aged 63.

CHARLTON.—On August 20, at Little Hulton, Lancashire, Thomas Charlton, L.S.A.L., aged 76.

COLGAN.—On August 10, at Tivoli Road, Kingstown, Henry Colgan, L.K.Q.C.P.I., aged 54.

DUFFY.—On August 20, in London, James William Duffy, M.D., late of Valparaiso, aged 72.

DUIGAN.—On August 27, at Mullingar, Anne, widow of the late Samuel A. Duigan, M.D., F.R.C.S.I., late of Killeggan, County Westmeath.

GAYER.—On August 26, at Calcutta, Edward John Gayer, Surgeon-Major, Indian Army, aged 44.

GOOLDEN.—On August 19, at Altrincham, William Goolden, Surgeon.

HAMILTON.—At Morkstown, Co. Dublin, the beloved wife of John T. Hamilton, M.D.

LYDDON.—On August 22, at Faversham, Kent, Sarah, the wife of W. Reeks Lyddon, L.R.C.P.Ed., L.R.C.S.I., L.S.A.L.

MEEK.—On August 16, at Market-Drayton, William Sutherland Meek, M.R.C.S.E., aged 59.

POLLARD.—On August 20, at Chorley, Lancashire, John Pollard, M.R.C.S.E., aged 84.

ROSE.—On August 29, at Ealing, W. J. Franckin Rose, M.R.C.S., late of Gloucester Crescent, Hyde Park, W., aged 72.

SHARP.—On August 28, at 41 Kensington Park Gardens, W., Henry Dockyer Sharp, F.R.C.S., in his 82nd year.

STEWART.—On Sunday, August 18, at the Knock, Belfast, Mary Frances Stewart (née Le Clerc), aged 72 years, wife of the late Robert Stewart, M.D., formerly Medical Superintendent of the Belfast District Hospital for the Insane.

VISE.—On August 20, at Spalding, Lincolnshire, W. Foster Vise, M.R.C.S., aged 35.

THE MECHANICAL SYSTEM OF UTERINE PATHOLOGY.

By GRAILY HEWITT, M.D. Lond., F.R.C.P.,

President of the Harveian Society, &c., &c.

LECTURE I.—(*Concluded*).

(*Continued from page* 179.)

Abnormal softness of the Uterus as a predisposition to Distortion, &c.

WE find, then, that the uterus is provided with certain apparatus designed to restrain and modify its movements, to enable it to resist to a certain degree forces tending to displace or to alter its shape. We have next to inquire how it happens that displacements and distortions originate, and why it is that the apparatus in question fails in certain cases to preserve the proper equilibrium.

It is obvious enough that the position of the uterus would be more readily disturbed by external shocks or by physical exertions, if the ligaments and attachments of the organ were relaxed and less firm and rigid than usual. And undoubtedly whatever tends to produce such relaxation and to diminish the rigidity of these structures will favour the occurrence of displacement. This is a statement the truth of which would be probably universally admitted. That relaxation of the uterine attachments which constitutes a part of the phenomena of pregnancy is well known, and it is well understood that the circumstance that the uterus is liable to become severely displaced after labour is over, is to some extent, at all events, a consequence of this relaxation of the various structures holding the uterus in its proper place. And although severe dislocations of the uterus do not often occur in consequence solely of this relaxation, yet undoubtedly it has a considerable share in their production.

No doubt, after pregnancy is over, an unusual strain is put upon the uterine ligaments and attachments in consequence of the greater size and weight of the organ; and it is manifest that the two things in conjunction—viz., the relaxation of the ligaments *plus* the increased weight of the uterus—will favour the occurrence of a displacement. The degree of relaxation of the uterine attachments varies much in different cases. Possibly, if every patient were in perfect health at the time of delivery there would be no such relaxation; the uterus would not give way, and the attachments would be of sufficient strength to prevent displacement. But we know well that many women are in anything but a good state of health when pregnancy comes to an end; the uterus often remains too large, owing to defective or retarded involution, and associated with this there is weakness of the uterine ligaments and attachments.

It has been already remarked that the uterus itself possesses certain physical qualities which render it most important aid in resisting forces tending to bend it and distort it. This quality is firmness, hardness, and considerable rigidity. I desire now to point out how this resisting faculty may be diminished and rendered practically inoperative in protecting the uterus against the action of physical forces tending to bend and distort it.

In a certain number of cases of uterine distortion the patient is in perfect health at the time of the accident or event producing the distortion, but in the large majority of cases it is not so; and in most of the cases we witness in practice the subjects of the affection are patients who have been confessedly out of health previously. This is an important generalisation, and it will serve as an introduction to what follows.

In one of the three propositions embodying these recent views on uterine pathology, and published five years ago, it is stated that "the change in the form and shape of the uterus is frequently brought about in consequence of the tissues of the uterus being previously in a state of unusual softness." More recently, in a paper read before the meeting of the Brit. Med. Association at Manchester, I directed attention particularly to this subject—viz., the presence of undue softness of the uterus as a factor in the etiology of uterine distortions. Inquiry into the condi-

tion of the uterus in the early stage of flexions, at the time when the symptoms begin to declare themselves, has made me aware of the fact that in these cases there is usually a very undue softness of the uterine tissues present, the ordinary firmness and resistance to the touch being wanting. Inasmuch as cases of decided flexion occurring in women not married offer the best subjects for analysis in regard to the etiology of the affection, I selected a number of such cases for illustrating the prevalence of this particular feature in the early history of uterine flexions, for in married women, or those who have had children, other disturbing elements come into play. My observations were limited, therefore, in this paper to the nulliparous uterus. Twelve cases were narrated in which uterine flexions, associated with undue softness of the uterine tissues, were met with in a marked form. The subjects of these cases were young women, most of them in an extremely feeble state of health, suffering severely from symptoms referable to the uterus, and who had been for some time incapacitated, more or less completely, for the ordinary duties of life. They were all found to be suffering from decided flexion of the uterus, and the fact concerning them to which it was my object particularly to direct attention was the state of the uterine tissues in these cases. Observing carefully the various facts concerning cases under my notice, this peculiarity some time ago attracted my notice, and I consider it worthy of prominent mention. Searching further into the history of cases such as the above, it became evident that this extreme softness of the uterine tissues was met with chiefly, indeed, I may say, almost universally, in young women whose nutrition was in a very low state, and who had for some time—some years in some of the cases—habitually taken little food. Some of them had been underfed at school; others had been weakly, and allowed to take only what their appetite suggested, which was very little; in others a more or less constant feeling of nausea had interfered with the taking of food. In short, the preceding history of these cases was one of semi-starvation. The uterus, in common with other parts of the body, was consequently very imperfectly nourished, and the result was that its tissues had lost their natural tonicity and firmness. Hence the softness which by clinical evidence seemed plainly to be due to the insufficient food supply. (The paper here alluded to is printed *in extenso* in the *British Medical Journal*, Nov. 3, 1877.)

Mal-nutrition of the uterus is, then, a cause of undue softness of the uterus. The undue softness of the uterus constitutes, according to my experience, one of the most powerful predisposing causes of uterine flexion. The reason is obvious; for, under these circumstances, slight exertion or application of disturbing mechanical forces is more liable to produce uterine distortion than would be the case if the uterine tissues were in a sound state, and this accounts for the occurrence of the distortion in a great number of cases.

Hitherto, I have spoken of softness of the uterus as predisposing to flexion in unmarried women. But when we consider the subject of the etiology of flexion in the case of married women, we encounter a fresh series of facts. It is well known that when pregnancy is over, the uterus offers a mass of considerable size, and that it has to undergo a process designated the involution of the uterus, by virtue of which it regains its original dimensions. While the involution is in progress the uterus is softer than usual. When the involution is interfered with, this softness of the uterus is more marked than in other cases. The tissues of the organ are, in some of these cases, extremely soft, and the organ is a long time contracting to its proper size. Examining the uterus after labour we are not unfrequently able to substantiate this fact. The uterus may be found extremely soft as late as a month after parturition, the organ being at the same time much too large. The question, Why does the involution in some cases proceed so imperfectly? offers an interesting subject for inquiry. In the cases in which I have observed it the associated condition universally present has been extreme feebleness and general weakness. It will generally be found, I believe, that the subjects of these cases are individuals who have been recently, or at some previous time, very insufficiently nourished. A low and meagre dietary during the period of childbed is responsible for this irregularity in many instances; but, of course, weakness and feebleness may have been present during the pregnancy, and may have been produced by mal-nutrition then or at any antecedent period. In any case it has the effect of disturbing the proper involution of the uterus when the pregnancy is at an end.

Again, after abortions it is not uncommon to meet with retardation of the contraction of the uterus; the organ remains for some time loose and open in texture, and wanting in firmness, and the presence of undue softness of the tissues can be readily substantiated.

The frequency with which flexions originate shortly after labour has occurred is a remarkable fact. Many patients suffering from these disorders have been perfectly free from all symptoms of uterine affection previously, but their pains and discomforts date from some one particular pregnancy. This is a common statement for patients to make in relating the history of their troubles. Clinical evidence abundantly shows that disturbance of the involution process constitutes a very decided predisposition to the occurrence of flexion, and the explanation which obviously suggests itself is that the undue softness of the uterine tissues is responsible for the subsequent distortion of the organ. It by no means happens that the uterus becomes changed in shape in all cases where involution is retarded, but it is certainly the fact that exertions which in more healthy subjects would have little or no disturbing effect on the uterus do, in these, produce, very frequently indeed, marked and serious distortions, leading to grave and troublesome effects, not seldom leaving their injurious consequences traceable many years after the commencement of the disease.

The degree of softness of the uterus which may be present varies in different cases. I have seen cases in which it was so considerable that the uterus appeared absolutely at the mercy of the action of gravity, the fundus inclining backwards or forwards according to the position the patient happened to assume. In particular may be mentioned a case of chronic retroflexion associated with this extreme softness of the tissues. In this case, after the fundus uteri had been supported posteriorly by means of a pessary for a little while, the uterus became decidedly anteflexed. This was dealt with, whereupon the organ became again retroflexed. Finally, it became necessary to apply support, both anteriorly and posteriorly, to keep the uterus straight. The patient was quite comfortable when her uterus was in proper position, and exceedingly uncomfortable when, for any reason, the mechanism used failed to restrain the abnormal movements of the uterus.

In short, observation teaches that the uterus possessing its natural firmness resists forces tending to bend it with success, unless those forces happen to be considerable. Very severe accidents may produce suddenly a decided uterine flexion, but these cases are not very common, whereas cases in which the uterus has slowly become weakened and softened, and thus incapacitated for resistance to external influences, are comparatively very frequent, and it is under these circumstances that slight accidents, over-walking, over-exertion, produce injurious effects.

The Problem to be solved.

It will now be necessary, in reference to the problem before us—viz., the question as to the importance and influence of the mechanical diseases of the uterus—to consider the clinical aspect of cases of uterine disease more particularly. We have now to survey another series of facts: namely, the symptoms, abnormal sensations, discomforts, and inconveniences which patients experience. On the one hand, we have patients suffering variously, unable to walk, experiencing pains of various kinds, suffering in a multitude of ways from derangement of the men-

strual functions, presenting various other symptoms traceable to the influence of the uterus. On the other hand, we have information from clinical observation, from *post-mortem* examination, and otherwise, of the existence of a variety of changes in the position, size, shape, texture, and vascularity of the uterus, certain abnormalities of appearance of the os uteri, increase of secretion, &c. Now, it is evident that any system of uterine pathology professing to be a system must be an intelligible interpretation of these various phenomena. The suffering, and the cause of the suffering, must be ascertained ; the symptom and the lesion must be placed in the proper relation one to the other. It must be shown that the pain or inconvenience from which the patient suffers stands in proper relation to this, that, or the other alteration of the uterus. This analysis of symptoms has been hardly attempted, the chief attention of uterine pathologists having been directed solely to the discussion of the uterine changes—the presence of inflammation, the presence of so-called ulceration, and the presence of congestion, each one of which has in turn been put forward as *the* important pathological condition of the uterus ; and these have occupied much attention, but little has been done to determine the relation of these changes one to the other, or with the view of ascertaining the connection of particular lesions with particular symptoms.

I have drawn up two lists, the first (A) a list of the symptoms of all kinds which may be observed in connection with diseases or affections of the uterus, these symptoms being placed as nearly as possible in their order of frequency. The second (B) is a list of the various physical changes which the uterus may undergo.

A. Uterine Symptoms.

Pain ... 1. Spontaneous.
2. Produced by motion (dyskinesia).
3. Undue sensitiveness of uterus to touch.

Leucorrhœa.
Dysmenorrhœa.
Menorrhagia.
Amenorrhœa.
[If married—Sterility, abortions.]
Various reflex phenomena :—
1. Sickness or nausea.
2. Hysteria.
3. Convulsions.
4. Cephalalgia.
5. Melancholia.

Disturbance of functions of bladder.
Disturbance of functions of rectum.
Disturbance of sexual functions (dyspareunia).

B. Uterine Changes (non-organic).

Change in position.
Change in size of walls.
,, ,, cavity.
,, ,, cervix.
Change in shape.
Change in patency of canals.
Change in texture.
Undue hardness.
Undue softness.
Increased vascularity.
Disorders of innervation.
Increased secretion.

Here, then, we have the data for the construction of a pathology of the uterus ; all the possible changes on one side, all the possible effects on the other. It must be understood that organic diseases of the uterus, cancer and fibroid tumour, are excluded from the list, the nature, course, and effects of these organic diseases being better understood. It must not, however, be forgotten that these organic diseases may occasion one or all of the uterine symptoms.

Looking at the list of uterine symptoms on the one side, and the list of possible uterine changes on the other, it is evident that the clinical importance of any one of the possible uterine changes should be, approximately at all events, indicated by the frequency with which it occasions uterine symptoms. If it can be shown, for instance, that any one uterine change or any one combination of uterine changes, has a very decided pre-eminence in this respect, it will be natural to conclude that considerable importance is to be attached thereto. Further, should it be shown that this particular change or combination of changes is particularly associated with those especial uterine symptoms of which patients most complain, an additional reason will exist for attaching great importance to this uterine change. Further still, should it be capable of being shown that there is a rational and intelligible explanation of the frequent association of these particular uterine changes with those especial uterine symptoms, there will be a greater reason still for thinking these uterine changes of importance.

(*To be continued.*)

LECTURES ON LOCALISATION IN CEREBRAL DISEASE.

By Prof. CHARCOT, M.D.,

Physician to the Salpetrière Hospital, Member of the Academie de Medicine, Par s ; Fellow of the Clinical Society of London, &c., &c.

(*Continued from page* 79.)

The considerations which have just been given may, I think, be employed to explain why hemiplegia resulting from destructive lesions affecting the grey cortical matter only is, as a rule, transitory, while that which is caused by injury to the substance of the internal capsule is of long duration, and often incurable.

We can easily see by the hypothesis proposed, how the lenticular and caudate nuclei, and the so-called motor regions of the cortical matter of the hemisphere, could supplement one another in their functions, supposing that the connecting bands which constitute the capsule have remained entire, and continue to keep up the connection between the grey centres in question and the periphery, though this could not have been the case had the continuity of the bands in question been interrupted.

I may further remark, that this supplementation may take place not only between the different grey nuclei, but between different parts of the same nucleus. It has been shown as far as the caudate nucleus of the corpus striatum is concerned, that destructive lesions of the most remote parts of this nucleus are uniformly signalised by more or less distinct hemiplegia, transitory, but total, that is to say affecting the face and limbs as well. In this respect there is no difference to be seen between the head, tail, and middle part of the caudate nucleus. From this it appears—as Dr. H. Jackson has reasonably remarked—that each piece of the corpus striatum represents the whole nucleus on a small scale. Beside which, experiment gives results like those obtained by clinical observation, showing that partial irritations of the caudate nucleus always produce associated movements of the other side of the body, and never isolated movements confined to one limb or part of a limb.

In cases of destructive lesion of the internal capsule slow reparation of the nervous structures could alone reproduce the re-establishment of the functions. But this work of repair, which really takes place sometimes, as certainly does not take place, except under peculiar circumstances. It is rendered certain by very numerous observations that hæmorrhages which destroy to a certain extent the motor fibres of the capsule, almost necessarily produce a "fasciculated lesion," which beginning directly beneath the clot, can be traced on the same side, in the foot of the crus, in the pons, the anterior pyramid, to the level of the decussation of the medulla, and below this last, in the side of the cord opposed to the clot, all the length of the lateral column, to the lumbar enlargement.

III.—I consider this a suitable time for considering the pathological anatomy and physiology of the *secondary degenerations* or *descending scleroses* as they are called.

It is incontestable that they are the chief causes of the persistence of motor paralysis in the cases under consideration. And I am of opinion that we must for the most part attribute to them the *permanent rigidity* (called *late rigidity*) which sooner or later affects the paralysed limbs in such cases, and plays an important part in the prognosis of cerebral hæmorrhages.

1. At the outset we must pause to consider a fact which really is at the foundation of the matter. Hæmorrhagic clots, as far as their locality is concerned, are not all equally adapted for the production of consecutive scleroses. The result is that among these lesions there are some which do not cause descending scleroses, while others as certainly do. In this second group are the lesions (even when circumscribed, destructive) which, according to M. Turck, affect the fasciculi of the internal capsule in their course between the lenticular and caudate nuclei, in the anterior two-thirds of the capsule. On the other hand, lesions limited to the grey nuclei of the cerebral masses (the lenticular and caudate nuclei and the thalamus) are not followed by consecutive sclerosis. This remarkable fact was clearly demonstrated by Turck in 1851. M. Vulpian and I, in some researches we made together at the Salpétrière (1861-1866) bearing on the subject, confirmed M. Turck's statements, which has also been done by M. Bouchard (1866). We also proved the truth of a certain number of not less interesting statements of M. Turck, which I proceed to repeat.

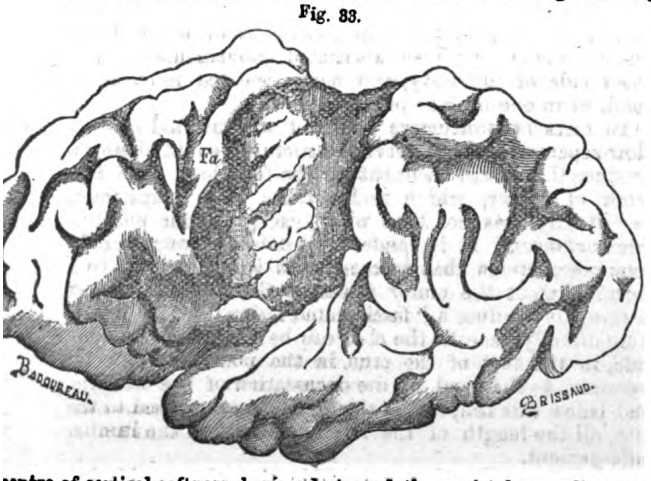
2. Lesions situate outside the central masses, in the valve of Vieussens, even when small, produce descending sclerosis, supposing that they are not too far from the foot of the corona radiata.

3. Lesions of the grey cortex of the hemispheres, if very superficial—the results of meningitis, for example—do not produce descending sclerosis.

4. On the other hand, cortical lesions, extensive in area and deep at the same time—that is to say, involving the grey matter and white substance at once, as is seen in cases of ischæmic softening, such, for example, as would result from obliteration of an important branch of the Sylvian artery; such lesions, I say (supposing that there is no implication of the central masses), *in certain conditions* involve consecutive scleroses as pronounced as those caused by lesions of the anterior part of the internal capsule.

Among these said conditions, one most important is the *seat* of the cortical affection. As we shall see, my own observations have shown that superficial yellow patches of large extent, whether in the occipital lobe or the anterior part of the frontal lobe, are *not* formed by consecutive fasciculate scleroses, while they will as a rule arise, if the lesion affects the two ascending convolutions (parietal and frontal), and the neighbouring parts of the parietal and frontal lobes (fig. 33). I shall return to this matter more minutely farther on.

Fig. 33.



centre of cortical softness, having destroyed the parietal ascending convolution, a great part of the frontal ascending convolution, and the greater part of the convolution of the insula. The central masses were not affected.

5. Finally, the seat and extent of the lesion appear to be the two fundamental conditions—the nature of the morbid affection has no marked influence. The proper seat and extent given, the lesion sufficiently destructive to rupture the medullary fibres, descending sclerosis will follow; foci of hæmorrhage and softening, simple or syphilitic inflammation, holding nearly the same rank.

The case is different with certain tumours which, developing gradually, *separate* the medullary fibres without breaking them. And for this reason such tumours may be met with in the cortical regions spoken of above as favourable to its production without any consecutive sclerosis.

Clinical Records.

ST. MARY'S HOSPITAL.

Injury to the Liver and Kidney from a Crush.—Recovery.

Under the care of Mr. NORTON.

Reported by Mr. F. FRASER.

GEORGE WOOD, æt. 13, was admitted to the hospital on June 24th. He had been squeezed between the tire and driving-chain of a mill wheel. Immediately after the accident he was partially collapsed; skin cold and clammy; face anxious; pulse small and irregular; great pain over abdomen, and especially left hypochondrium and lumbar regions; vomiting, but no hæmatemesis. Patient was placed in bed and hot bottles were applied; he passed a restless night; and on the following day complained of a good deal of pain in left hypochondrium; pulse small and irregular, 100; temperature 100·8; tongue clean; bowels open; passed water naturally, which was normal. He continued much the same until the 29th. He was still restless, and complained of great pain in the abdomen, especially over the region of the left lobe of liver on pressure. Fomentations were applied, and opium mixture given three times a day. On the following day he began to get jaundiced, his urine of a chocolate colour, sp. gr. 1025, containing albumen, blood, and bile; from this time he became excessively jaundiced; temperature 100·2; pulse 100; bowels constipated; these were relieved by an enema; no blood was passed per rectum. These symptoms continued the same up to the 2nd of July, when the urine still contained much bile, but no blood or albumen. On the 5th there was less jaundice, but urine remained the same as on the 3rd. From this time the jaundice began gradually to disappear, and on the 8th the patient complained of no pain; could sit up easily; slept well; temp. normal; bowels open, but still bile in the urine. He continued improving, and on the 22nd there was no pain, no jaundice, urine normal, bowels open, fæces normal colour.

Remarks.—The case is one of interest, though it may be doubtful what was the precise extent of the injury received. From the collapse on admission and from the position and character of the pain,-which on the day after admission was limited to the left hypochondriac and lumbar regions, it was diagnosed that the left lobe of the liver was injured. Within two days there were symptoms of peritonitis, followed by jaundice and by albuminuria and hæmaturia. On the fifth day after admission blood appeared in the urine, a condition for which it is difficult to account. Hæmaturia immediately following the accident might have been expected as the result of injury or laceration of the kidney, but a delay of several days throws some obscurity upon its cause. As regards the liver, it was evident that the left lobe was lacerated or injured, which was the cause of the extreme pain in the left hypochondrium, that subacute inflammation both of the liver and of the peritoneum followed; that some of the ducts of the liver became closed and the bile consequently absorbed into the blood.

Special Correspondence.

[From our Special Correspondent].

Rue de Luxemburg,
July 21st, 1878.

I have digressed very much from the programme I started with—special correspondents always do digress; *mais revenons à nos moutons.* I said in my first letter, I would describe some of the appliances useful in time of war, as hospitals, ambulances, tents, stretchers, splints, &c., so I must keep my promise.

It will be impossible to describe them all. I shall first give a rapid glance at the general distribution of these appliances, and the localities where they may be seen.

The French exhibit will be found near the garden, bordering on the military school, where there is a pavilion, in which are the ambulances of the Minister of War and Marine, with models of tents, waggons, brancards, &c.; whilst in the English cottages will be found a somewhat similar list, furnished by the Society for Aiding the Sick and Wounded. In and near *La Rue des Nations*, will be found the exhibits of other foreign countries in this class, amongst which, I may mention those of Belgium, Switzerland, and the Lower Countries.

HOSPITALS AND TENTS.

In the French section, I must point out the very interesting models of M. Tollet, the hospital-tent of Professor Le Fort, and the ambulance-tent of M. Couette; and in the Belgian section, the model of an hospital exhibited by the Red-Cross Society, and the small *hôpital-baraque*, constructed on the plans of Dr. Harzé. The system of ventilation in these buildings is novel, and well worthy of examination. The Red-Cross Society of Utrecht has furnished the plans of the Hospital Amalia, which may be seen in the gallery of Les Pays Bas.

Simplicity in hospital construction is one of the first desiderata, and the next construction we are about to notice, though it does not comply with this condition, still has some claims for consideration. As it is the production of an Englishman, we shall give a more detailed account of it. Mr. Henry Greeway, of Plymouth, the designer, in Class 14, exhibits the model and plan of an hospital, constructed of an outer shell, containing in its interior a smaller building made of glass, or enamelled sheet iron and glass. By subdividing the internal departments, a number of cells are formed, so that each patient is virtually isolated and protected from contamination. The ventilation is novel, and the warming secured by hot-air pipes, the corridors are formed by the space between the two buildings, and, as in Tarnier's lying-in-wards, the walls are made of material that can be washed, so that when evacuated, the cells can be disinfected. This form of building, owing to the expense, will never come into general use.

England and Russia have lately had some diplomatic relations, so I pass on to the Russian quarter, to the plan and model of the Hospital St. Vladimer, at Moscow. Dr. Charles Rauchfuss, of St. Petersburg, is the designer. It is an excellent specimen of a mixed hospital. The pavilions plan has been adopted for infectious and contagious diseases, and isolation is well secured.

In a previous letter I mentioned some of the other principal hospitals, so that I need not pass in review all the different constructions of the various nations.

MEANS OF TRANSPORT FOR THE WOUNDED.

The French Society exhibit a number of carriages for transport, and a train of nine or ten waggons for railway conveyance. It is well fitted up and provided with every comfort for the sick and wounded. The carriages are necessarily heavy. This is a difficulty which can hardly be surmounted. Security against accident or a break-down must be one of the first considerations in transport waggons or *voitures*. Weight should be, of course, as little as possible for the horses, but a heavy carriage will also be, if on springs, a more comfortable one for wounded or sick patients.

The ambulance carriage designed by Lieutenant-Col. Kromhout, and exhibited by the Minister of War for the Lower Countries is a very ingenious piece of contrivance, as it admits of two purposes. It serves both for the transport of the wounded, and for a flying ambulance, being fitted up with necessaries. The Belgian, Spanish, and English carriages are also worthy of commendation. I believe Dr. Porter deserves the credit for the designs of the English models.

Amongst the brancards, I may particularly mention those of Dr. Mooy and M. D'Ieteren; they will be found in the Belgian section. In the latter section will be found a very portable double ambulance pannier, which may be placed on a horse in front of the rider. It is small, very complete, and is exhibited by Dr. Hermant. For a similar class of appliances, M. Arrault deserves credit, and he evidently took into consideration in designing his apparatus, the importance of condensing everything into the smallest space.

APPLIANCES IN THE FIELD—HAMMOCKS—SPLINTS.

Near the machine gallery are the English contrivances for transporting the wounded, and in the English cottages may be seen a complete sanitary train with stretchers, models of ambulance tents, carriages, &c.

A good surgeon does not require ready-made splints, or any of those complicated apparatus with which our instrument makers flood the market. Individual ingenuity can always supply for pressing needs out of the most simple material. This has been clearly proved by Surgeon-Major Porter in the "Pocket Book" he has published, and in which may be found diagrams illustrating the application of the most common material for injuries received in warfare. Thus for fractures, a broken sword, bayonets, straw, branches of trees may be temporarily subsidised, whilst a stretcher is always at hand, made of rifles, cross belts, knapsacks, coats, trowsers, &c.

This earnest and energetic surgeon has on view extemporised splints formed of telegraph wire, which only requires some soft material wrapt round it, as a piece of paper, shirt, coat, &c., to form a handy and useful support in case of fracture. Surgeon Porter also exhibits a model of a passengers' railway luggage van, in which the wounded may be carried by means of hammocks.

It would have been simpler and admit of more critical comparison if all the appliances for the wounded had been arranged in one building, for some of them are difficult to find, as they are situated in the midst of a heterogeneous class of articles. Of this I was reminded when looking at a case of soldiers' uniforms, amongst which I saw a model representing the method of rendering first aid to the wounded. The group consisted of a surgeon kneeling and supposed to be restoring an unconscious person, represented by a poupee, whilst standing by are two orderlies, one carrying a case filled with bottles, whilst the other holds in his hand a bandage. It is the production, of course, of an army tailor.

The arrangement of grouping this class of exhibits according to country has, however, advantages, for the object of the exhibition has not been invidious comparison, but to show what each country is doing. As these special appliances are thus scattered, the visitor will have to inspect other articles which he would probably never have seen if all the medical appliances were grouped together.

I have mentioned the localities where the visitor will find them. I cannot, unfortunately, make this letter into a *catalogue raisonnée.* I must not omit mentioning some hospital furniture as

INVALID CHAIRS, BEDS, STRETCHERS.

and particularly I may point out the exhibition of invalid couches, chairs, &c., by Ward, of Leicester Square, London, Harris, of Birmingham, the couches of Hamilton, of Brighton, and the stretcher or invalid lift of Child and Hinde, of Euston Road, London. For utility and sound workmanship all these must come in for high commendation.

DRUGS AND DRUGGISTS' SUNDRIES.

In Class 14, as I have mentioned in my first letter, there were not as large a number of English exhibitors as I expected, but I omitted some names which I now supply.

Deaf ladies will feel gratified with the acoustic instruments of Reid and Son, whilst their elastic conveniences are well worthy of approbation. I can say the same of the elastic belts and stockings of Longdon and Co.

In the direction of galvanic batteries there is a new invention of a single liquid battery, exhibited by Mr. Pulvermacher in the French section, Class 15, which attracted considerable attention in scientific quarters, when it was

presented to the Academy of Science on the 2nd of July last. In this single liquid battery, effective depolarization of the negative metals is obtained by atmospheric oxygen, instead of—as in the Léclanché battery—peroxide of manganese. Although the invention tends to the economical and simplified production of electric light and other industrial applications, its combination seems well fitted for the use of medical practitioners.

As the feeding-bottle meets a universal want, I must commend the cheapness of Mather's feeding-bottle, and its quality. Their case is certain to attract the notice of mothers and housewives, as their "Nigrine" marking-ink, which possesses the great advantage of not requiring heat to make it permanent, is on view.

Leslie's tape plaster has been favourably received by the profession, not only for its quality, but for the saving effected. Besides this specialty, Leslie and Co. have on exhibition some attractive-looking specimens of almonised cod-liver oil and medicated plasters. I found in Class 47 the firm of Burgoyne, Burbidges, Cyriax, and Co., one of the largest London wholesale houses. Their exhibit is a very large and comprehensive one, embracing essences, essential oils, drugs, chemical and pharmaticutical products. Their specimens are very fine. In this class will also be found other English exhibitors, as Broomhead, Bowdler, Atkinson, and Allen Hanbury, all of whom have on view excellent samples of their respective specialities.

Though in our special department we have not such a large numbers of exhibitors, yet what is shown by those who have taken the trouble to represent British productions in Classes 14 and 47 is good. We have, however, to congratulate ourselves that the general British department is a credit to the country, and that whether for comparison or competition, we can hold our own in the race.

[Owing to pressure on our space, the letter of our corres- has been unavoidably held over.—Ed.]

Literature.

CYCLOPÆDIA OF THE PRACTICE OF MEDICINE. (a)

When we see the respected names of Eulenberg, Nothnagel, Ziemssen, Jolly, Kussmaul, and Bauer, as the Editors of a volume on "Diseases of the Nervous System," we are to a certain extent satisfied not only that the work will be well done, but that it will command, as it deserves, the scrutiny and the impartial investigation of every well-wisher to the advancement of our scientific knowledge of medicine. There is a thoroughness and completeness in the practical consideration of each of the subjects in this volume, which in our opinion, gives to it an especial qualification; a qualification which in fact can only be looked upon as most desirable, emanating as it does from men of deep thought and high scientific culture. Dr. Eulenburg is the first contributor, and devotes 170 pages to the consideration of vaso-motor and trophic neuroses, including hemicrania, angina pectoris, unilateral progressive atrophy of the face, Basedow's disease, progressive muscular atrophy, pseudo-hypertrophy of the muscles, and true muscular hypertrophy Hemicrania, according to Dr. Eulenberg, is essentially of vaso-motor origin ("hemicrania vasomotoria"), and is capable of sub-division into the sympathico-tonic and the angio-paralytic, or neuro-paralytic forms. He says, "this distinction, which is not without its value in therapeutics, seems to have met with rather general acceptance, as shown by later works (Brunner, Berger, Holst, and others), and although the etiology of this condition is little understood, yet it undoubtedly comes under the denomination 'constitutional neuropathy,' and among other predisposing circumstances, we should attach very special importance to age, sex, and hereditary tendency. The female sex being very much more disposed to hemicrania than the male, the proportion being about that of five to one, yet it has been clearly proved that hemicrania is not, as some would have us believe, simply dependent upon diseases of the female generative system. The period when hemicrania is most common is decidedly between puberty and the fiftieth year. There are few who doubt the hereditary predisposition to migraine, and that it comes under the class which was first distinctly formulated by Griesinger, the essential character of which must probably be stated as consisting in congenital anomalies in the primary structural development of the central nervous apparatus. Its association with epilepsy and insanity are merely matters of every-day observation. Dr. Eulenberg says, "that in families which have tendencies to constitutional neuropathic diseases, there are often individual members who suffer with the migraine, while others are attacked with epilepsy, insanity, and other morbid conditions of this class, where it defies the most careful observer to discover any direct cause." The symptomatic description given does not embrace more than we find in Dr. Liveing's classical work upon this disease, excepting, perhaps, in one or two particulars.

O. Berger is quoted as having lately shown by accurate tests of the sensibility in a case accompanied by fluxionary hyperæmia (hemicrania, angio-paralytica), that there may exist a pathological acuteness of the sense of touch. For instance, in corresponding parts of the frontal region, he found the diameter of the circle of perception of touch to be on the right or affected side one line, while on the left it was four lines. Variations of temperature of 0·4° C. were perceived on the right side, of 0·8° C. on the left, and similarly the electro-cutaneous test indicated sensibility at a minimum distance between the coils of 160 millim. on the right, 120 on the left. Dr. Eulenberg says that at the height of the attack, the examination with the ophthalmoscope shows, in a few cases, dilatation of the arteria and vena centralis retinæ, on the affected side contortion of the vein, and dilatation of the vessels of the choroid, and a darkening of the tint of the fundus oculi. In continuation of an analysis of the symptoms, he says, concerning the alterations in the pupil, the dilatation during the height of the attack, depends on an increase in the tonic excitation of the dilator nerve fibres, which arise from the cilio-spinal centre, and follow the course of the cervical sympathetic; the subsequent contraction depends on a secondary diminution in innervation corresponding to the condition of the vaso-motor fibres. Doubtless, the most important question to the practitioner is the treatment of this affection. Dr. Eulenberg says that it is partly general—that is corresponding, at least in theory, to the *indicatio morbi*, and partly symptomatic or palliative, consisting in attempts to conquer the single attacks. Empirical remedies consist of iron, quinine, quinoidine, berbeerin, caffein, guaranin, nitrate of silver, bromide of potassium, &c.; but he appears to place special confidence in the aqueous extract of ergot, given in doses of from one to fourteen grains daily, in the form of pill, or in the form of subcutaneous injection. This remedy is to be used in the angio-paralytic form. But in the sympathico-tonic form, he prefers the nitrite of amyl as introduced by Richardson, Brunton, and Wood, and he also speaks very favourably of the use of the constant galvanic current, which he says seems to have a destiny such as hardly any other possesses. One electrode is placed upon the cervical part of the sympathetic at the inner edge of the sterno-cleido-mastoid muscle, whilst the other is placed on the palm of the hand, and the circuit closed.

Angina Pectoris.—This term, according to Eulenberg, is intended to designate a group of symptoms, of which the most characteristic are the following:—*Pain in the region of the heart occurring in paroxysms, which usually radiates over the left side of the thorax, and the left arm—more rarely over both sides and arms; the pain is associated with a peculiar sensation of anxiety and constriction, and often also with other motor, vaso-motor, and sensitive disturbances.* The period between the paroxysms is free from pain, and usually from all other symptoms. The disease, therefore, bears the plainest marks of a neurosis, and may be classed according to its symptomatology with the visceral neuralgias, including cardialgia, colic, hysteralgia, and so forth. In the history of this disease, we find associated the names of a large number of eminent physicians, who held divers opinions concerning its nature and pathogenesis, which was somewhat defective previous to the series of physiological experiments upon the sphere of action of the cardiac and vaso-motor nerves (v.

(a) "Cyclopædia of the Practice of Medicine." By Dr. H. von Ziemssen. Vol. xiv. Diseases of the Nervous System. London: Sampson Low, and Co. New York; Wood and Co.

Bezold, Goltz, Bernstein, Ludwig, M. and E. Cyon). Dr. Eulenberg seems to be of opinion that smoking is a direct and essential cause of this disease, and he expressly states that the form of angina pectoris concerning which he has written, has no relation with those forms which are complicated by faults in the valves of the heart, or fatty degeneration of this organ, nor those forms which are caused by atheromatous processes in the aorta, and especially by ossification and contraction of the coronary arteries. He insists upon it that these changes do not furnish the exclusive basis of the symptoms which has been proved by the discoveries of Senac, Corvisart, Bianchi, and others, but refers the cardinal symptoms, such as pain, anxiety, and disturbances in the action of the heart and the circulation of the blood, *to definite disturbances of the innervation of the heart, consisting in an abnormal increase or diminution of the activity of the nerves forming the cardiac plexus;* in fact, nothing more nor less than a constitutional and hereditary neuropathy; and he mentions by way of confirming his views the peculiar connection which often exists between it and other diseases of the group, such as hysteria, insanity, and epilepsy. We are in a measure inclined to agree with Dr. Eulenberg's views in this respect, yet it will take far more evidence than he has brought forward to assure the mass of practitioners in this country, that *latent gout* is not more or less connected with, and causative of angina pectoris, even though there be no organic changes in the heart or vessels. He says that Landois (1860) first subjected all the symptoms of angina pectoris to a thorough and systematic physiological analysis, and divided the disease in accordance with the results of this analysis into four classes, caused respectively by—1. Disturbance of the activity of the excito-motor cardiac nervous system. 2. Conditions of irritation in the region of the cardiac branches of the vagus. 3. Reflex excitement due to irritation of the organs of the abdomen (angina pectoris reflectoria). 4. An affection of the vaso-motor nerves of all or of most regions (angina pectoris vasomotoria). Finally, Dr. Eulenberg brings forward the noteworthy physiological experiments of Goltz, Gurbocki, Von Bezold, Hein, Carstatt, and others, to show how readily *reflex vagus neuroses* can be accounted for, when considered in relation with the medulla and the great sympathetic ganglia. Dr. Eulenberg's views of the treatment of this disease are very similar to those usually accepted in this country. He discards blood-letting, and speaks in favour of derivatives and counter-irritation, as far more beneficial than the internal administration of the so-called nervines and antispasmodics, valerian, musk, castoreum, camphor, and the like; he recommends the inhalation of chloroform, ether, or nitrite of amyl, and the general or constitutional treatment may, he says, consist of the preparations of iron, zinc, or arsenic, the bromide of calcium, or of potassium. The induced current in the form of the faradaic brush may be useful. Duchenne affirms that he has not only arrested very severe attacks instantly and completely by cutaneous faradisation of the nipple and region of the breast, but that he has by protracted use of this means produced a permanent cure in two cases. Von Huebner has lately obtained a permanent cure by galvanism, in a case which seemed to have a rheumatic origin. He placed the positive electrode upon the fossa suprasternalis, and the negative upon the cervical ganglia of the sympathetic on both sides in succession; then he placed the positive pole upon the lowest cervical ganglion, and the negative upon the sensitive spots at the angles of both shoulder blades.

At first only very weak currents of from four to six elements were borne. The attacks ceased from the first session, and did not return, and by degrees it became possible to use stronger currents of from eight to ten elements.

Hemiatropia fasocialis progressiva (Unilateral progressive atrophy of the face—Definition).—*This extremely rare disease is characterised by a chronic loss of substance in one side of the face, which usually begins in the external soft parts, and passes successively to the deeper tissues;* the neurotic nature of its origin is not proved by pathological anatomy, but is renderered very probable by internal and external reasons.

We see nothing in the short chapter devoted to this affection, of either clinical, physiological, or pathological novelty. It is quite evident that it usually occurs in connection with a neurosal diathesis, and is most probably associated with a neuritis of the trigeminal nerve, or Gasserian ganglion, or possibly with an atrophic or degenerative change in definite parts of the grey matter of the pons, or floor of the fourth ventricle, or superior sympathetic ganglia.

Basedow's Disease—Grave's Disease—Definition.—"By the name of Basedow's disease, we designate a group of symptoms of which the chief are *palpitation with an accelerated pulse, swelling of the thyroid gland*, and exophthalmus. A number of other disturbances, especially in the nervous system, the circulation, and (in females) in the genital sphere are frequent symptoms, but not quite pathognomonic. The three cardinal symptoms are found associated in the great majority of cases, but each one may be absent now and then, or be present in a degree scarcely passing the limits of physical health, or exophthalmus may be present alone, in which case it always attacks both eyes, and is combined with other general disturbances of health."—Dr. Eulenberg, in agreement with other physicians of the present day, considers this affection to be essentially a neurosis, and says, I must continue to uphold the neurotic theory as an essential postulate, while I regard the question of localisation in definite sections of the nervous system (especially in the cervical sympathetic or its centres), as not yet solved, and at present insolvable. The etiology, symptoms, and course of this disease, as described most fully and carefully by the author, do not differ greatly from other recent writers, and is certainly quite in agreement with our own experience. Firstly, the symptoms may be ushered in with attacks of an hysterical or even epileptic character, palpitation and accelerated pulse not affected by digitalis; then, secondly, the signs of struma and swelling of the thyroid set in; and thirdly, the exophthalmus. The different points in reference to temperature, physical and functional differences in the circulation, more particularly as affecting the heart itself, and retinal and post-ocular vessels, are all noted with an exactness unequalled in any other work upon the subject, and yet the author sticks to his text, and is in no way discursive. The physiological theories relative to the sympathetic nerves are discussed with fairness to the several authors who bring forward their experimental investigations to prove actual morbid changes as the result of lesions of this part of the nervous system, into the nature of which in a review of this kind it is impossible to enter; but there is a practical point in the treatment with which we think our readers ought to be made acquainted. That is, the direct application of the constant galvanic current to the sympathetic, to reduce the pulse rate, and diminish the exophthalmus. Dr. Eulenberg says: "My own first experiments in this treatment of the sympathetic in Basedow's disease, were made in 1867 upon a lady, æt. 50, sent to me for treatment by Von Graefe, who had an habitual pulse of 108-130, with abnormal tension of the carotids. When her cervical sympathetic was galvanised by placing the negative pole upon it with a very weak current (from six to eight elements), the pulse was observed to sink gradually to 84 or even to 70, while the tension of the carotids and radial arteries continually diminished." He goes on to say that repeated applications are necessary, continued over a considerable period to effect any absolute benefit.

Progressive Muscular Atrophy—Definition.—A wasting of the voluntary muscles, which is gradual progressive, extends to a more or less considerable part of all the apparatus of motion, and usually observes a very distinct order of march. It is further a severe disease, ending with the complete annihilation of the functions of the muscles affected, very rarely curable, and in many cases leading directly to death. It is characterised anatomically by the nature of the pathological changes in the muscles, consisting in chronic myositis, interstitial proliferation of connective tissue, with secondary destruction of the muscular fibres, and finally, fibrous degeneration. The history of this disease is of great interest, and has received marked attention from the greatest authorities, from the time of Sir Charles Bell to the present. To Duchenne is due the credit of first discovering the anatomical changes in the muscles. To Cruvelhier, that the anterior roots of the spinal nerves were chiefly involved. To Gull, Lockhart, Clark, and others, that the disease was associated with changes in the grey matter of the anterior horns of the spinal cord; and lastly, to M. Charcot, who says that progressive muscular atrophy is a chronic irritative atrophy of the anterior ganglion cells, which are gradually, successively, and progressively attacked. Dr. Eulenberg does not care to face the question with a dogmatic answer as to whether this disease is, as Friedreich maintained, essentially a myopathy, or having an origin primarily in the nervous system. He says, "at present, nobody seems able to give a concrete statement about it," and we think he is to be praised for his candour. But in our experience we are in perfect agreement

with Charcot and others, in fact to a certain extent with Eulenberg himself, that it is essentially a neuropathy, involving primarily the motor cells of the anterior horns of the spinal cord, where the nutritive processes are in a state of instability, and where the normal reciprocity between centre and periphery of generating and conducting power becomes interfered with, and finally exhausted. But all these questions are most carefully studied in the article before us, which is well deserving the most careful attention. The following two articles on pseudo and true muscular hypertrophy are exhaustive, and we would advise our readers not to be content with this bare abstract, but to go carefully through the chapters for themselves.

(To be continued.)

A KEY TO ORGANIC MATERIA MEDICA. (*a*)

So many works on materia medica and therapeutics have been recently published, that at first we wondered why there should be another addition to the literature of the above subjects. On looking into the book, however, we found that it was not only written chiefly for students of the South-London School of Pharmacy, but that, as far as the vegetable materia medica is concerned, it might be turned to very good account by medical students who are preparing for the primary examination of the several examining boards. Although the work consists of nearly 500 pages, its typography is so clear and open, and the descriptions are so concise, that it is by no means heavy reading. The botanical source, collection, general characters, uses, and doses, of each drug, are all briefly described; while especial attention has been given to the chemistry of the drug, and of its active principles. In fact, a distinctive feature of the work is the separation and tests for active principles, so as to aid analysts in their work on drugs; and under the head of "Specially Distinctive Tests," will be found a sort of qualitative course, verified by experiments, which, if followed step by step, will lead to the detection of the article under examination. This part may not be so useful to the medical as to the pharmaceutical student. Still, even the latter should not be ignorant of the chemistry of some of the active principles, alkaloids, &c., of the more valuable articles of the vegetable materia medica, and for information on the subject he could not refer to a better book than that of which Dr. Muter has just brought out a new and revised edition. On the eve of students going up for their examinations, we have often found they knew little or nothing about the decompositions which take place in the preparations of such common and valuable drugs as morphia, quinine, strychnia, &c. That would scarcely be the case if they had carefully read such a clear description, for instance, as Dr. Muter has given of the changes that take place in preparing sulphate of quinine. After describing the pharmacopœial process, he says:—In this process the hydrochloric acid dissolves out the quinia and cinchonia as hydrochlorates, setting free kinic acid. The soda precipitates the alkaloids by conbining with the acids. The precipitated alkaliods are then carefully treated with just enough of diluted sulphuric acid to obtain a perfectly neutral sulphate, when the sulphate of quinine crystallises out, being much less soluble than the sulphate of cinchonine which remains in solution.

A TEXT-BOOK OF OPERATIVE SURGERY. (*b*)

It is not often that we have the pleasure of noticing a book which has been so much wanted as this "Text-book of Operative Surgery." Operative surgery and surgical anatomy are subjects which especially admit of good descriptions and copious pictorial illustrations. And yet, up to the publication of the present work, there was no well-illustrated manual in the English language to which the young operator could refer for the information he required. Mr. Norton therefore deserves the gratitude of students and junior members of the profession for introducing to them in an English dress the well-known text-book of Bernard and Huette, a work, which even in its original form, has had no inconsiderable circulation both in this country and in America.

It is evident that if books are to be of much use to students in practical surgery, they must be well and copiously illustrated. One glance at a well-executed drawing will often give him a more correct idea of the way in which a certain operation should be performed than the most elaborate description. When, however, good illustrations and good descriptions go together, the reader cannot fail to form a just conception of the operation described. In fact, it is not too much to say that, with a fair knowledge of anatomy, and after the careful study of the work before us, the young operator might even undertake an operation which he had never seen performed. But the great advantage of this, over all other text-books of the kind, is that it will enable the student to know a good deal about an operation before he sees it practised either on the dead body or on the living subject. He who visits the operating theatre with such a knowledge of practical surgery as may be gathered from the careful study of Bernard and Huette's descriptions and illustrations, will much better understand and appreciate what he sees—every manœuvre of the surgeon, and every incision that is made—than he who enters the theatre perfectly ignorant of the subject.

The illustrations, then, form an important feature of the work, and too much praise cannot be bestowed either upon the surgeons who designed, or the artist who executed them. The reader's attention is at once attracted by their number, their accuracy, and their artistic finish. When we state that there are 88 plates, that each plate contains several figures, that each step of an operation is illustrated, and that, when there are two or three different methods of performing the same operation, each method receives its appropriate illustration, some idea may be formed of the pains the authors have taken to demonstrate every operation that is performed on the human body.

Not the least valuable portion of this text-book are the introductory chapters and plates devoted to the surgical anatomy of the region in which the operation is performed; as thereby the student is better instructed in the nature and relative position of the parts concerned in the operation.

With regard to the text and the style of the translation, we may remark that the former is remarkably clear and concise, and that the latter is a faithful rendering of the original. The mere translation, however, of the French edition was not the only task Mr. Norton set himself to accomplish. A full description of the many improvements in operative surgery which have been introduced since the publication of the French work has been also added; and where there are several methods of performing the same operation, special reference has been made to the operations that are practised in this country and on the continent at the present day.

In taking leave of this elaborately illustrated, and yet very handy, text-book, we may say that it is about the most useful work on surgery that has appeared for many years; and we venture to predict that it will have no little influence in fostering among students a desire to study operative surgery in a more practical and systematic manner than is usually the case.

(*a*) "A Key to Organic Materia Medica." Written for the Students of the South-London School of Pharmacy. By Dr. John Muter, M.A., F.C.S., Director of the School. 2nd edition, revised and re-arranged. London: Baillière, Tindall, and Cox.

(*b*) "A Text-book of Operative Surgery and Surgical Anatomy." By Prof. Claude Bernard and Ch. Huette (de Montargis). Illustrated by 88 plates. Translated from the French and edited by Arthur Trehern Norton, F.R.C.S. London: Baillière, Tindall, and Cox. 1878.

A CHAIR of military science has been founded at the Polytechnic High School of Stuttgart, and a pensioned Prussian engineer officer has been called to it. This is the first chair of the kind established in a German high school. A chair of military science was established some time ago at Zurich in connection with the Polytechnic School there.

THE acquisition of Cyprus appears to be about as valuable to the British Empire as the proverbial white elephant. The climate has, so far, proved as fatal to our troops as the worst parts of India; and already many valuable lives are returning badly invalided. The chief of the medical staff is down with fever, and the scare to quit the island is as great as the first rush to get there.

PHYSICIANS' FEES.

"THERE'S no hand so dear to me
As the hand that holds the fee."

So runs the old couplet; and we can imagine with what glee the Sir William Gulls and the Sir William Jenners of the last century used to shake the hands of their liberal patients. But the times are now changed. The expense of living has become greater, and, as regards physicians, the means of living less, than was the case a century ago. If the wealth of patients has increased their parsimony has, in too many instances, increased in like proportion. And if we might judge from the correspondence that has recently appeared in the *Times*, the day may come when the hand that holds the fee will be doubly dear to the physician, and when he will sigh for those good old times when physicians were well rewarded by their confiding and grateful patients.

But to be more serious, it may at first sight seem strange that people should in this country be found to grudge the physician his fee at a time when riches have increased, when wealth has become more widely distributed, when medical education is both arduous and expensive, and when medical science and medical art are so much more perfect and so much more entitled to the confidence, respect, and gratitude of the public than they were a century ago.

At this late stage of the discussion respecting the physician's and surgeon's fee, it will be unnecessary for us to add much to what has been already said in explanation of the correspondence above mentioned, and in favour of remunerating the physician or surgeon in such a manner as his education, his professional standing, and his talents deserve. We may, however, remark that, unless we are mistaken, there are two reasons why the consultant's fee is, with a few exceptions, more grudgingly given now than it was in the time of our predecessors. In the first place, it may be confidently asserted that the public have not so much confidence in medicine as they formerly had. They have the same respect for surgery, and can place in this science the same confidence as they did in the days of Cheselden or Abernethy; but in medicine their faith has been more than once rudely shaken. They can believe in an operation when they cannot believe in a prescription, and the surgeon's knife is often more honoured than the physician's drugs. Then, again, the relation between the physician and general practitioner is, in a scientific and educational point of view, very different to what it was in the last century. Then the disparity between the social and intellectual standing of the two classes of practitioners was much greater than it is now. Then the general and professional ignorance of the apothecary, as he was called, put such a premium upon the advice of a physician as cannot be claimed for him now that his general scholarship and his collegiate qualifications, rather than his professional skill, have placed him in the front ranks of the profession. In proportion as the public have recognised the great improvement that has taken place in the social and scientific status of the great body of the profession, so has their deference to the authority of the physician decreased, and in proportion as their deference decreased, so have they become less disposed to put so much confidence in his advice, or reward him so liberally as in times gone by. Of course we do not mean to say that there are no other circumstances at the bottom of the complaints that have been recently made in the columns of the *Times:* but the reasons we have assigned appear to us legitimate ones, and none the less true because they have escaped the notice of both our lay and medical contemporaries.

But whatever change has taken place in the relation between the physician and the general practitioner, the former will, in virtue of his superior acquirements and the demands of society, be always an indispensable member of the medical profession, and will always be entitled to as good an honorarium as the means of the patient will allow. It should, indeed, rather exceed than fall short off what his predecessors were in the habit of receiving. As for quibbling about the amount of a physician's fee for the first consultation, it is too humiliating to take any notice of. Such a fee might be justly a high one, or, at all events double those that are paid for subsequent consultations, inasmuch as not only does a first consultation take up a good deal of the consultant's time, but the value of his advice will greatly depend upon the diagnosis he has formed during the first consultation, and the care with which he has conducted his examination of the case.

DRUG ADULTERATION AND IRISH UNION CONTRACTS.

THE recent meeting of the Pharmaceutical Conference in Dublin, and, notably, the communication read to it by

Prof. Tichborne, which we printed *in extenso* in our issue of August 21st, have reanimated the interest of the profession in the question of the adulteration of drugs, and have raised anew the question to which the MEDICAL PRESS has devoted much attention—the continuance of the present system by which the sick poor of Ireland are supplied with medicines. The facts narrated by Prof. Tichborne are capable of neither dispute nor explanation, and are such as to provoke the indignation of honest men and to shed disgrace upon the class of pharmaceutists who are guilty of these practices. We invite our readers to reperuse the paper. The author proved, upon the evidence of his analyses of drugs (not sought out to support his idea, but presented to him in the ordinary course of business) that the sophistication of medicines is by no means confined to the most expensive drugs, but is flagrant in connection with the common cheap medicines. He found that powdered hæmatite ore was sold as peroxide of iron, impure phosphorus made from bone-dust and oil of vitriol, linseed made from pressed grape refuse, pure colocynth almost impossible to obtain, and the proportion of active principle in the commercial specimens varying between 14 and 2½ per cent. Prof. Tichborne concluded his paper with the following remarks :—

"As regards the moral responsibility, I wish emphatically to express my conviction that the control of drug adulteration must come from the pharmaceutical chemist himself. In time, the public analysts will be selected from this body, and if he once realised his great responsibility, and it is a very great responsibility, he will be able to control the manufacturer. He is much more than an ordinary trader. He has been declared to have an education outside the three R's, and outside his buying and selling. This in itself is a responsibility. If he says I must have a colocynth, which represents 14 per cent. of active matter, get it how you like, the manufacturer or grinder will supply it. He, the pharmacien, will satisfy the doctor—the public in years to come, will learn to appreciate him—but best of all he will satisfy his own conscience.

"'Nought's had, all's spent—
Where our desire is got without content.'"

Prof. Tichborne's paper brought to their legs several gentlemen who gave, what to *them* seemed, good excuses for the perpetration of these frauds, and one physician—Dr. MacSwiney, of the Catholic University—who stated his conviction that many of the medicines supplied to hospitals were utterly unreliable and disappointing in their effects, and the discussion wound up by Prof. Tichborne reiterating the facts already asserted by him, and expressing his opinion that there could not be any palliation for the practices which his inquiries had disclosed.

We do not think it necessary at present to consider the question from the point of view of the private consumer, who, we will assume, can take care of himself; but we think it right to supplement Prof. Tichborne's communication by exposing what we must call the stupid and nefarious system of drug contracts for the supply of the Irish Poor-law Service.

For the benefit of the uninitiated we must explain that there are 893 dispensaries and 163 union workhouses in Ireland, at which institutions not only the destitute poor but almost the whole of the artisan classes and petty farmers of Ireland receive medical advice and medicine gratis. The medicines are compounded by the Dispensary or Workhouse Doctor, as the case may be, and the drugs are supplied by wholesale drug houses by contract. The tenders for supplies are opened yearly or half-yearly, on the 25th of March or September. On the approach of that date the doctor is supplied by the Local Government Board with a voluminous list of medicines in the margin of which he writes down the quantities of whatever drug he may require. The contractor sends in his tender on a similar form, covering ten pages folio of printed matter, writing opposite each item the price at which he will supply the article for the year. He undertakes to furnish them "of the best description and quality, and in strict accordance with the several formulas in the British Pharmacopœia, at the prices hereunder stated;" and he further "guarantees that no methylated spirit shall be used in the preparation of any tinctures, spirits, essences, extracts, or liniments." These tenders are laid before the Board of Guardians, who are empowered to deal with them in all respects as they would deal with offers to supply coal, oaten-meal, or anything else.

We have characterised this system as stupid and nefarious, and we give our reasons *seriatim*. We justify the statement.

(*a*) Because it is notorious that in very many instances the medicines so supplied are not only not of the "best description and quality, and in strict accordance with the several formulas of the British Pharmacopœia," but are, on the contrary, the worst rubbish which can be obtained in the London drug market. Multitudinous instances are on record where, by mere chance, this fact was detected; and several of the speakers at the Pharmaceutical Conference asserted that many articles were tendered for at prices which would not go near purchasing the genuine materials for making them up. We believe it to be a fact that in many instances the terms of the contract are systematically broken, and that stuff is supplied for the use of the paupers which has lost (or never possessed) the therapeutic powers which it should have.

(*b*) Because the Guardians, who are the arbiters in the matter of drug supplies, are almost without exception small farmers and country shopkeepers, who are profoundly ignorant of the look—the use—or the price of any single drug in the list. They have not the most remote notion of distinguishing whether the drug offered is good or bad, or its price cheap or exorbitant, and, in fact, never make even a pretence of selecting the drugs by quality.

Those who profess to be initiated in the most successful method of dodging the Guardians and securing the contracts assure us that the following is the trick :—

The contractor is fully aware that the only means of selection which the Board of Guardians usually exercise is, to tot up the price column of the tender and give the contract to whoever produces the lowest tot. Accordingly, the contractor takes care to make the figures at the bottom of the page as low as he possibly can. This he manages by writing opposite all the drugs *which are almost certain never to be used* a nominal sum—a farthing a pound for a five-shilling drug—or a penny an ounce for some scarce alkaloid which the dispensary doctor hardly ever heard of. On the other hand, he writes down opposite *the ordinary drugs*, *e.g.*, senna, castor oil, Epsom salts, quassia, &c., a price upon which he can make an exorbitant profit. Thus, inasmuch

as the drugs in common use are few out of the ten folio pages he is enabled to produce a total at the bottom of the page which is ridiculously small in comparison with the market value of the drugs, but when the guardians come to pay they find that they are giving for their every-day medicines a much larger price than what is fair, and the nett result of the system is that the paupers recieve drugs of the lowest quality, while the ratepayers pay much more than would purchase the best drugs in the open market.

We do not, of course, assert that the system which we have just described is universal in Ireland. We know it is not, and that there are contractors honest enough to supply none but genuine medicines, at a fair price, but we assert that it is rare to find a Board of Guardians willing to pay the market rate for good drugs when they can get those which they may suppose to be of the same quality at prices which appear to them to be greatly less ; and we repeat that the facts which we have stated are notorious amongst those conversant with the drug trade in Ireland and amongst those members of the medical profession who have had experience of the contract system, and we appeal for corroboration to the prices set down in the tenders which will be found on the files of the Irish workhouses, and to the statements publicly made by speakers at the Pharmaceutical Conference.

The object which we have in hand is to fix the discredit of this system upon those responsible for it, and to draw public attention to the matter, in order that a remedy may be provided. Who is to blame? Certainly not the guardians, for they do, we believe, as well as they can under the circumstances. They make no profession of knowing anything whatever about the matter which is submitted to their decision, and they take the only means within their reach to arrive at a prudent settlement of the dilemma. It would be as reasonable to submit the War Office contracts for Snider rifles to a jury of matrons as it is to submit drug estimates to country farmers, and if those functionaries allow themselves to be tricked it is only what might be reasonably expected.

Nor can we pass an unqualified condemnation upon the drug-contractors who pursue these practices. They are without doubt guilty of dishonesty in supplying drugs of a quality inferior to those for which they have contracted, and they are guilty of disgraceful practices in cooking their tenders for the beguilement of the Guardians ; but it requires a high standard of commercial morality to refrain from taking in a customer when you are well aware that the customer is profoundly innocent of the value of the goods, and that, if you are too honest to trick him your next-door neighbour will do so without scruple, and you will lose the contract without benefiting the customer. We quite believe that there are drug firms in Ireland who refrain from sending in tenders for Union contracts because they will not descend to the usual practice, and because they know that, without doing so, they would have no chance of the contract.

The medical officers are entirely free from blame in the transaction. They are not usually asked their opinion as to the quality or prices of the drugs. Nor would it be their duty to make the necessary analyses and examinations, in order to give such opinion if asked. As a general rule they are quite incompetent to judge of the purity of a drug by its appearance, or to form any idea as to its fair price, for it is not an essential part of their education, and few of them have had special education in drug testing. Lastly, they are, with one consent, snubbed whenever they venture to complain of the quality of any drug furnished to them. If their complaint turns out to be undeniably true the Guardians are told that it was a simple mistake of the druggist's clerk, and the contractor's friends on the Board of Guardians—of whom there are always several—serve out the doctor when the opportunity arises.

Upon the Local Government Board for Ireland alone the discredit must rest of permitting the continuance of this system. It is they who have placed the selection of tenders in the hands of the Guardians, well knowing the utter incompetency of those officials to form a judgment on the subject—it is they who, having in their hands the evidence of the cooking of tenders by contractors for the purpose of hoodwinking the guardians, omit to supply the Guardians with information as to the market prices, which they might do for a nominal expenditure once a year—it is they who permit the supply of sophisticated medicines to the sick poor, having the best reason to suspect, if not to know, that those medicines are not according to the contract or to the British Pharmacopœia.

That they are fully aware of the truth of the facts which we have stated and the extent of the abuses which we have exposed, they cannot deny, because they have already recognised the evil as one demanding their interference. Some years since the Irish Local Government Board announced that they considered that the system demanded reform, and that they were about to reform it by taking the contracts out of the hands of druggists, and establishing for the supply of Unions a central depot, with an Apothecary-General over it at a large salary.

To that proposition a violent opposition was given by all concerned in the matter, and the influence of the MEDICAL PRESS was used to prevent its being carried into effect, because we regarded it as unpractical—not calculated to remedy all the abuses, and redolent of a job. We enthusiastically approved of the proposal to reform, but with equal emphasis condemned the method proposed by the Local Government Board ; and, in the end, the intention was abandoned, and both pauper and ratepayer left to the mercy of the drug-contractor. Since that day the Local Government Board has maintained a sulky indifference, and has disregarded every representation on the subject.

We congratulate ourselves, however, on the hope that the time has come when the question may be brought before Parliament with probability of success, and, in order that its bearing may be fully discussed, we intend to return to the subject before long.

THE ARMY MEDICAL DEPARTMENT.

IT is strange that none of the Licensing Bodies which replied to the queries of the Committee which is now investigating the causes of discontent in the Army Medical Department, should have proposed a remedy, which appears to be the one thing needed to place the Army Medical Department upon a satisfactory footing. That remedy is the bestowal of *substantive* instead of *relative* rank upon officers of the Army Medical Department. It

is anomalous that the Medical Department should be the only non-combatant department connected with the Army in which the *prestige* of military rank is denied. What is proposed, and what has of late been agitated a little in England, and a good deal in India, where official rank is everything, is that this *relative* rank should be done away with, and that officers of the Medical Department should receive commissions as lieutenants, captains, majors, and colonels "in the Medical Department of our Army." This would not entitle them to any military command whatever, but would at once and indisputably place them in the social position to which they are entitled. Non-military men cannot realise the great importance and social value of military titles in the military world; but all will admit that *relative rank* is a sham and a delusion. How long would the Woolwich examinations continue to attract competitors if military engineers were told, "You shall have relative army rank; Mr. Smith shall be entitled *Engineer Smith*, with the *relative* rank of lieutenant or captain; and Mr. Robinson shall be called *Engineer-Major Robinson*, with the *relative* rank of major or lieutenant-colonel?" What wonder that the supply of candidates for the Army Medical Department should fail under similar conditions? The Medical Department is now neither civil nor military. If medical officers wore no uniform, and had no *quasi* military titles, there would be no reason to complain. They would take their position as members of an honourable profession. They are, however, obliged to wear a military uniform, but are debarred from the titles which are supposed to be inseparable from that uniform. Until substantive and not sham rank is granted to officers of the Army Medical Department, that Department can never attain a satisfactory footing.

Army medical officers are "nobody's children." They belong to no regiment, and have no *esprit de corps;* they wear a uniform which is more a shame than a glory to them, for it carries no privilege or title; by civilians they are regarded as semi-military individuals, and by military men as civilian intruders.

Unification and *short service* have destroyed the only two attractions that belonged to the old Medical Department. The former has broken up the regimental *home*, and the latter has ruined the *career* of the army medical officers. The system of *short service*, as it exists, is admitted on all hands to be an error, and may be dismissed without further allusion. The *unification* scheme is unpleasant for individuals; but there can be no doubt that, at least for field service, it is better and more elastic than the old regimental system. To make officers satisfied with unification a departmental *esprit de corps* must be established, to supplant the old regimental *esprit*. This can certainly be done without any State expense or difficulty—by simply granting *real* instead of what is called *relative* rank to officers of the Army Medical Department. By such a measure only can a regular supply of professionally and socially eligible candidates be secured.

Thus shall their social position in the military world be raised to an indubitable standard; and thus shall be created a professional pride and *esprit de corps* in the Army Medical Department, which will go far to secure its constant efficiency and prosperity.

Notes on Current Topics.

The Heroic Treatment of Acute Peritonitis.

It is rare now-a-days to hear of a practitioner who sticks to the antiphlogistic treatment in vogue thirty or forty years ago; but according to the *Boston Medical and Surgical Journal*, an eminent American physician has been attacking several cases of idiopathic peritonitis with all the formidable weapons which our ancestors were wont to wield. In a clinical lecture delivered in the Hospital of the University of Pennsylvania, Prof. H. C. Wood says he has seen several cases of the idiopathic form of this disease. "In all of the five cases," he remarks, "I have had complete cures. My treatment is nothing new; on the contrary, it is very old. I remember my uncle, Dr. George B. Wood, saying that he never lost a case of peritonitis in an adult, and the reason he gave was that he always bled his patients from the arm until they fainted, and then put one hundred leeches on the abdomen. I am proud to say that I am a thorough believer in the same plan of treatment, antiquated as it may appear. . . . In my second case I also leeched very heavily, it being too late to bleed. In my third case I drew thirty-two fluid ounces by leeches. The patient's cheeks grew deathly pale, her pulse was reduced, and she was left weak and relaxed, but made an excellent recovery. So with the fourth case. In my fifth case the excessive purging rendered the subject scarcely a fit one for venesection. This treatment was followed up by repeated doses of calomel and large doses of opium, and this again by repeated blistering."

We have more than once expressed our opinion that blood-letting is a practice which is more neglected at the present day than it deserves; but we should hesitate a long time before we advised the profession to adopt a plan of treatment which Dr. Wood so complacently recommended to his pupils. At all events, it is very questionable advice to give young students and practitioners, in whose inexperienced hands such heroic measures might be attended with very disastrous results.

Electric Light versus Gas Light.

We are told by the *Globe* that the shares of the London Gas Companies have suddenly fallen in value, and that this fall is due to the prospective lighting of our streets and houses by means of electricity. It is to M. Jablochkoff that the world owes the grand discovery without which the electric light could not have become available for any purpose except for lighthouses. He discovered a means of breaking up the electric spark, so that instead of one intensely dazzling beam the light could be subdivided, producing a number of separate lights or lamps, in which, of course, the over-brilliance of the original spark was reduced by diffusion to a convenient, yet, for general purposes, still too great luminosity. Our contemporary is quite right in remarking that in a sanitary point of view, the advantage of the new light is very great. Coal-gas vitiates and overheats the atmosphere of our dwellings. It gives rise to sulphurous and other noxious vapours which are formed by the combustion, even of the best purified coal-gas. A person who has entered from the open air a room in which gas

is burning, will at once appreciate the unwholesome state of the atmosphere in which many families pass the longest evenings of the year. Even in our own practice we have known the health to be very seriously affected by remaining for several hours in a room in which gas is burning. Gas-light and the surrounding air are bad for the eyes, bad for the lungs, bad for mental application, and bad for the health in general, and therefore the profession would gladly hail any other kind of light which would be free from those serious objections.

Magnetic Sleep.

In the Court of Session, Edinburgh, Lord Gifford has just heard the case of James Bryce against Joseph Agnew, surgeon-dentist, of Glasgow, for £500 damages and expenses. It was stated that, about November, 1876, he entered the employment of the defendant as an apprentice, and remained till 1878. The plaintiff, at the defendant's request, went to his house at Crosshill every night. On these occasions the defendant induced the plaintiff to become the subject of experiments in magnetism. These experiments consisted in placing large magnets in front of, behind, and above the plaintiff's head, which were also connected with his head by means of magnetic chains. Besides these there were also rods of magnetised metal placed about the room, and the plaintiff was made to hold himself in such a position as to allow himself to fall under the influence of magnetism. These proceedings, and other experiments of a similar nature, which the plaintiff was unable to describe, were repeated by the defendant for several days running and frequently for about two hours at a time. The defendant enjoined upon the plaintiff the strictest secrecy as to the experiments, as well as to their nature and effect, and particularly enjoined him not to tell his parents. During the progress of the experiments, and, it was alleged, in consequence thereof, the mind of the plaintiff became seriously affected, and he became insane, and on one or more occasions was apprehended as a lunatic. His physical health was also shattered, and he was still suffering from the effects of the experiments. At the time when the plaintiff entered the employment of the defendant it was said he was in perfect good health, both of mind and body, and had been so all his lifetime. The defendant said the boy acted in the capacity of page, and he (defendant) feeling interested in the subject of magnetic sleep, subjected him to some experiments, without producing any effect. It was alleged that before entering the defendant's service the plaintiff had shown symptoms of insanity. The case has not concluded.

Carbolic Acid in Yellow Fever.

In a work on "Personal Protection against Yellow Fever," by Dr. John A. Wegg, of Kingston, Jamaica, the author speaks in high terms of the benefit to be derived from the use of this acid, both as a disinfectant and as a medicine. He recommends one or two drops of liquid carbolic acid to be taken in a little sherry and soda-water twice a day (morning and evening) on an empty stomach. It has a remarkably preservative action, and should be resorted to on the first appearance of the ailment.

The Best Basis for Violet Powder.

This was lately the subject of discussion at the British Pharmaceutical Conference. According to the *Monthly Magazine of Pharmacy*, Dr. Benger said it might be well either to place this article in the Pharmacopœia and give it an authoritative formula, or let it be understood that pharmacists as a body considered it might be composed of either vegetable or harmless mineral constituents. Mr. Benger did not consider starch a good basis for this powder, and founded his opinion partly on the fact that starch powder, if slightly moistened and kept at the temperature of the body, undergoes a kind of fermentation, and in a few hours becomes distinctly acid to test paper. Mr. Benger was distinctly in favour of a powder in which French chalk or silicate of magnesia was the basis, an opinion in which several of those present agreed, whilst many others indicated surprise that anything else than starch powder had ever been employed, and did not consider that any mineral powder could be equally innocuous.

Ventilation of Barracks and Hospitals in India.

A very interesting paper was read by the Hon. R. C. Parsons before the British Association on the above subject.

Notwithstanding every attempt to supersede the coolies in pulling punkahs over the soldiers in barracks and hospitals in India, the human labourer still keeps his post. The cost of these men to the Government every hot season is nearly £50,000 a year, for simply fanning the soldiers! This sounds absurd, but, in fact, no European could live without it, and the difficulty of superseding the human labour lay with the human arm and its action. In pulling the punkah, the human arm gives a jerk, and consequently the punkah gives a flap. It is this flap which is so dear to the British soldier, and leads him to roar "kenchaw" (pull) when the unfortunate coolie is overcome with sleep. Not only do these coolies go to sleep, but they bring disease into barracks, and moreover, the women of the bazaars dress up as men, and come at night to pull punkahs. Hence, an ever increasing desire on the part of the authorities to get rid of the punkah coolie, but no machine could imitate the jerk of his arm up to the time that Mr. Parsons and Captain Palliser took it in hand. Their motive power is compressed air, by which punkahs can be worked in any position with a much better effect than that given by coolies, because they can only give a jerk in pulling, but the compressed air gives the jerk in pulling, and also in pushing the back stroke. A machine, working a punkah, was exhibited at work, and attracted much attention. Not the least interesting part of the exhibition was a perfectly new ventilator, or air pump, designed by the Hon. Charles Parsons, for pumping foul air out of barracks and hospital rooms. This ventilator is placed in the ceiling of the room, and when the compressed air which works the punkahs is admitted to it, the air of the room is pumped out, and yet no draught is created. The authorities in England have strongly recommended these most useful inventions to the Government of India.

Population as a Test of National Prosperity.

THE Registrar-General for England, in his last report, says that various attempts have been made to estimate the amount and the increase of the capital of the United Kingdom, but hitherto no determination has been made of the value of the most important part of the capital, that is to say, "the economic value of the population itself."

Population not only has the power of earning and producing, but it gives the value to all kinds of property. Without population, land, houses, railways, yield no profit; quarries, and mines, and factories owe their value to the men who work them. "Should the population of a country decay, the value of its capital might sink to the vanishing point."

In the thirty-nine years and a half during which the General Register Office has existed, 7,619,759 people have been added to the population of the United Kingdom; "who, valued as land is valued by the annual yield of net profit, constitute an addition of £1,212,000,000 to the wealth of the nation." The minimum value of the population of the United Kingdom, men, women, and children, is £159 a head; that is, the value inherent in them as a productive, money-earning race. It follows that the United Kingdom, as the hive whence the swarm of emigrants passes yearly to the English Colonies and the United States, is a source of untold wealth. Probably the money value of the 8,000,000 people that emigrated in the years 1837-76 was £35,000,000 a year. "The policy of the people of this country has thus been a policy of progress. Since 1837, they have added on an average 192,873 souls annually to the population at home, and sent 202,868 sons and daughters to seek their fortune abroad."

Antagonism of Alcohol and Diphtheria.

DR. E. N. CHAPMAN (U.S.) has just published a small *brochure*, of 98 pages, in which he advocates the use of alcohol in both simple and complicated diphtheria. He not only, says the *Medical Record*, employs the supporting treatment in general, but relies upon alcohol as the *antidote* to the diphtheritic poison, as the stimulant and force-conserving agent, *par excellence*, in this disease. In this he is supported by M. Sanné, who, however, looks upon alcohol as "le plus sûr de tous les antiseptiques donnes à l'interieur." Dr. Chapman thinks that alcohol promptly and *liberally* given is an antidote to the poison of diphtheria, a febrifuge, a sedative, and a prophylactic as well as a curative, agent; and that it should be given as early as possible, and during even the so-called inflammatory stage. Out of 125 cases he only lost one—a fact which is certainly in favour of the alcoholic treatment of this disease.

With regard to this plan of treatment we agree with our contemporary, that the profession at large should heed these facts, individually test this most potent remedy, and not allow their prejudices or pre-conceived ideas of the nature of the poison of diphtheria to interfere with an honest attempt to lessen the mortality of this frightful malady.

Legalisation of Apothecaries' Measure.

BY an Order of the Queen in Council, published in the *London Gazette* of August 30, the following apothecaries' measures are made "legal secondary standards," in addition to those of a greater capacity long since legalised:—

"Imperial Standard Measures of Capacity to be used in the Sale of Drugs.—4 fluid drachms, weighing 218·75000 grains; 3 fluid drachms, weighing 164·06250 grains; 2 fluid drachms, weighing 109·37500 grains; 1 fluid drachm, weighing 54·68750 grains; 30 fluid minims, weighing 27·34375 grains; 20 fluid minims, weighing 18·22917 grains; 10 fluid minims, weighing 9·11458 grains; 5 fluid minims, weighing 4·55729 grains; 4 fluid minims, weighing 3·64583 grains; 3 fluid minims, weighing 2·73438 grains; 2 fluid minims, weighing 1·82292 grains; 1 fluid minim, weighing 0·91146 grains; also 3 fluid ounces, weighing 1312·50000 grains."

This is the first time that the foregoing measures have received legal sanction, although they have been in universal use for a long time, and the Act under which the order is issued dates from 1866.

The Fermentation Controversy.

A SOMEWHAT curious discussion has been recently occupying the attention of the Paris Academy of Sciences. It originated in the publication by M. Berthelot, in the *Revue Scientifique* of July 20, of a series of laboratory notes by the late Claude Bernard, on alcoholic fermentation, in which the great physiologist came to conclusions opposed to those so long advocated by M. Pasteur. It was natural that M. Pasteur should endeavour to weaken the force of M. Bernard's experiments and conclusions. In the *séance* of July 22, he drew attention to the publication of the notes, and explained their apparent opposition to his theory by the statement that Bernard's method of working was to proceed to the investigation of every theory as if its opposition were true, thus submitting every point to a crucial test. He declared his intention of taking up Bernard's series of experiments and working them out from the latter's standpoint, in the confidence that the result would be entirely in favour of his (Pasteur's) theory of fermentation.

The Mortality of Doctors.

THE question is often asked, are we longer or shorter-lived than other classes of the community? The answer is difficult. If we take for data the ages of physicians and surgeons of eminence, it would seem that the anxieties of medical life, the loss of rest, exposure to infectious or contagious disease, were not unfavourable to longevity. If a medical man commences medical life with a fairly balanced constitution, and with what is of still more or equal importance, a fair balance to his credit at his bankers, the chances are that he will both secure a good practice and live to a good age, provided he follows fairly the general laws of health.

If, on the other hand, his health is exceptionally good, and he is but scantily provided with funds, he will have greater difficulty in acquiring a good *clientèle*, whilst the worry and anxiety about pecuniary matters will have a tendency to shorten his life.

It is the worry about ways and means that kills. Casper affirmed that German medical practitioners were shorter-lived. Dubois has ascertained that out of 800

practitioners, 365 attained the age of 70 and upwards. This exceeds the proportion allotted to theologians. Accurate modern statistics are difficult to secure, but we feel certain it will be found the mortality will vary in proportion to the pecuniary position of the individuals.

Hospital Saturday in London.

THE fifth annual collection on behalf of the Hospital Saturday Fund was made on Saturday in all the principal thoroughfares, business centres, and railway stations throughout the various postal districts of the Metropolis. The collection began in some quarters, as at Covent Garden, Smithfield, and Billingsgate markets, as early as five o'clock in the morning, while in many parts of the suburbs, where the streets are usually crowded on Saturday nights, it was continued until quite late in the evening. There were altogether about 250 collecting stations, most of the tables, as on former occasions, being presided over by ladies, distinguished by wearing blue badges. The area of the collection has been considerably extended this year, and a large number of additional stations having been provided, it is anticipated that the receipts will show a considerable increase on the amounts previously obtained. It was originated, as is now pretty generally known, with the primary objecting of affording the working classes of the metropolis an opportunity of contributing to the support of the hospitals and dispensaries from which they derive so many advantages. The street collection was supplemented by subscriptions in a large number of City establishments and workshops, and in the various offices, departments, and branches of the Post Office, to facilitate which nearly a hundred thousand collecting sheets were issued from the office of the fund; and by the proceeds of an open air concert in Victoria Park, and other entertainments.

Curious Charge against a Doctor.

IT is reported in the papers that at the Glasgow Small Debt Court James Patrick and his father sued Dr. Herbert, house surgeon, Royal Infirmary, and Mrs. Lynch, one of the nurses, for £12, as damages sustained by James Patrick, by their having, without the authority of his father, cut from his right arm a piece of healthy flesh for the purpose of grafting it upon the body of another patient. Mrs. Lynch admitted that she had taken a piece of flesh from the boy's arm for the purpose of grafting it on the bad arm of another patient. The practice was quite common, and she did it on the authority of Dr. Herbert. Dr. Herbert denied that he had given Mrs. Lynch any such instructions. The Sheriff found the nurse liable in £5 damages and costs. The case against Dr. Herbert was found Not Proven.

The above statement seems almost incredible. If true we can only say that no occurrence could have happened more calculated to prejudice the minds of the public against the conduct of hospital officials, which conduct we know to be usually unexceptionable, and marked with the greatest kindness and consideration for the patients under their charge. We trust, however, that there is some exaggeration in the above statement, or that at all events the authorities of the Glasgow Royal Infirmary will submit the matter to a careful investigation.

The Nature of Syphilis.

DR. CORNIL, of Paris, one of the latest teachers on this subject, insists on the anatomo-pathological differences between soft and hard chancre, the period of incubation being the distinguishing feature. Soft chancre appears immediately after contamination, indurated after a time varying from ten to twenty-five days, and sometimes extending to a longer period, as has been proved by the observations of Langlebert, Rollet, Diday, &c., and the experiments of Wallace, Vidal de Cassis, Waller, and Pellizari. But what takes place between the time of incubation and the appearance of the chancre? Some authors affirm that the individual is contaminated during the period of incubation, the chancre being the local and first manifestation of a general disorder dating from the day of incubation. Others have denied this theory. M. Cornil considers the most probable hypothesis to be that syphilis is not generalised at the onset, but that the chancre is the first complication, which by little and little infects the whole economy.

A Minister of Public Health.

THE want of such a minister is universally recognised. It has been the dream of sanitary reformers, and we hope it may become a practical realisation.

Public preventive medicine requires a head, the interests of society demand a reconstruction of the present Governmental arrangements for the regulation of sanitary officers, and we shall not have an efficient sanitary machinery until the whole system is placed upon a more solid and comprehensive basis.

The multiplication of medical officers of health is a mistake. Every little town and village can now appoint a separate and independent medical officer of health, whose views of the duties appertaining to the office may be controlled or biased by petty elective bodies. This system is fatal to efficiency. There is a tendency at the present time to break up large districts, or combined rural and urban sanitary boards. High-class medical officers of health will not brook dictation, nor can they be bribed to overlook sanitary deficiencies. England must ultimately be mapped out, and large districts placed under the supervision of highly qualified medical experts in hygiene, on a somewhat similar principle to that of Local Government Inspectors. Such appointments would be independent of local influence. As we expect an Imperial scheme to regulate our water supply, so we may reasonably hope for an Imperial system of sanitary inspection.

The Rainfall of Last Month.

THE past month of August must be noted as a memorable one in a long term of years. The returns are not yet completed, but it is certain that it was the rainiest August we have had for a long time, and Mr. Plant, writing from the neighbourhood of Birmingham, tells us that he registered more rain last month than in any month of any year since 1852. The average annual fall at his station is 30in., or 2½in. per month, but in August he registered 7¾in., or rather more than a quarter of the yearly quantity in one month.

Schools for Medical Witnesses.

THE *Union Médicale* says that, after a paper on this subject had been read at the International Congress of Legal Medicine, by its President, M. Devergie, and a long discussion had taken place, the Congress passed the following resolution :—"That the Government be asked to establish in France institutions which have been at work for years in Hungary, Austria, Prussia, Belgium, Holland, &c., having for their object the formation of experts in legal medicine and experts in toxicology, remunerated by the State, and who shall be elected by *concours*, having for its basis trials essentially practical; that, with the object of educating such experts a great extension should be given in the different faculties of medicine to courses of practical legal medicine, such as M. Devergie first established at the Morgue in 1834, and which has been reopened last year at the request of Prof. Vulpian, Dean of the Faculty; and that special courses for instruction in toxicological analysis be opened at the Ecôles de Pharmacie.

The Dustbin Nuisance.

DR. WHITMORE, of Marylebone, says, in his last monthly report :—

The most prevalent and objectionable nuisance in the parish at the present time, for the existence of which no shadow of excuse can be offered, is the foul and offensive condition of the dustbins. In this respect I am compelled to state it as my opinion that the poor are by no means the greatest delinquents. In their dustbins, undoubtedly, is thrown a great deal of decaying vegetable refuse; but in the dustbins of the wealthy and well-to-do there is added the further and greater abomination of putrefying animal matter. Any person passing through the most aristocratic streets in the parish on a hot, close summer's evening will constantly have his sense of smell offended by foul emanations arising from the areas of many of the largest mansions, and which, on investigation, would be found to proceed from dustbins reeking with both animal and vegetable matter in a state of putrefactive fermentation. I need hardly say that this is a nuisance injurious to health, to which the provisions of the Nuisances Removal Acts will apply, but which, I fear, will never be effectually abated until some few of those who are responsible for the evil are convicted and punished.

Medical Practitioners in France.

Lyon Medicale says that in 1866 there were 11,254 doctors of medicine in France, and 5,568 *officiers de santé*, together 16,822 practitioners. In 1876 there were only 10,743 doctors and 3,633 *officiers*, together 14,376 practitioners, or less by 2,446. In 1876 the *pharmaciens* were 6,232 in number, the midwives 12,847, and the herbalists 983. In 3,484 communes, doctors alone practise, in 2,111 *officiers de santé* only, in 764 both doctors and *officiers*, and in 28,697 neither doctors nor *officiers*.

The Origin of Species.

AT one of the recent meetings of the British Association Mr. Huxley remarked that about the year 1860 there was nothing more volcanic, nothing more shocking, more subversive of everything right and proper than the proposition put forward that, so far as the physical organisation was concerned, there was less difference between man and the highest ape than there was between the highest ape and the lowest. Now, however, M. Quatrefages, whose views were very different from his, admitted that the proposition was one which no rational man would dispute. The Professor then dealt with the craniological and physiological data regarding man collected by M. Broca, Mr. Herbert Spencer, and the mental and social data gathered by Mr. Max Müller, Mr. Tyler, Colonel Lane Fox, and others. As to the history of man on the earth there was now a vast accumulation of evidence to show that man existed at a period when the physical condition of the world was very different from the present, but he admitted that so far as any fossil evidences of evolution were concerned he thought that at present they were entirely wanting.

It would, however, be better if evolutionists, instead of boasting of the number of scientists who were joining the ranks of Darwin and his followers, could manage to collect a few more facts in support of their theories. It is not the number of believers that testify to the truth of any doctrine; and the Darwinists cannot be surprised that their theories meet with so much opposition when there are no new facts forthcoming in support of them.

Non-Pauper Hospitals for Infectious Diseases.

THE Poplar District Board of Guardians deserve great credit for deciding to erect a new pauper hospital for the reception of patients suffering from infectious diseases. In his annual report, just issued, Dr. Talbot, the medical officer of health for the Bow and Bromley division of the Poplar district, testifies to the great need of such an institution, and remarks that during the past year he has requently been unable, through the want of accommodation at Highgate, to order the removal of private cases. He further urges that the 37th section of the Sanitary Act must be made compulsory, or the Poplar district will be supplied with cases from all parts of the metropolis, and adds that his experience justifies the belief that when the requisite accommodation is provided the public will become anxieus to be removed to the hospitals.

FOR the purpose of prosecuting biological researches, Prof. A. Agassiz has lately completed a superb establishment near his residence, wherein every device that experience could suggest has been brought to bear for the convenience of investigators. A building 45 by 25 feet has been erected on the side of a bay making up from the entrance to Newport harbour, and provided with the purest of sea-water by means of a steam-pump, which keeps a tank constantly filled. The tables are covered with a series of tiles of different colours, so that the minute animals of different shades can be the more readily overhauled when emptied upon them. The shelves in the laboratory are all of glass, the tanks are of slate, the conducting pipes are of iron, lined with a composition of rubber, which it is believed will protect them against corrosion. These tables are all well lighted, and are available for students, whom Mr. Agassiz invites to share his facilities. Four persons, in addition to himself, at present occupy the laboratory, in prosecuting their special researches.

In foreign cities the annual rates of mortality, according to the most recent weekly official returns were—Calcutta 23, Bombay 43, Madras 35; Paris 24; Geneva 19; Brussels 29; Amsterdam 21, Rotterdam 23, The Hague 25; Copenhagen 29; Stockholm 28; Christiania 22; St. Petersburg 40; Berlin 30, Hamburg 26, Dresden 26, Breslau 36, Munich 33; Vienna 35, Buda-Pesth 36; Rome 28, Naples 34, Turin 22; Alexandria 47; New York 28, Brooklyn 22, Philadelphia 18, and Baltimore 19 per 1,000 of the various populations. Diarrhœal diseases showed exceptionally fatal prevalence in Copenhagen, Berlin, Breslau, and Munich.

The rates of mortality continue to be very low throughout the United Kingdom. In Edinburgh they were as low as 17 per 1,000, London 20, Glasgow 21. In a few of the large cities and towns the rates were somewhat high, Dublin 26, Liverpool and Birmingham 29, Hull 31, and the highest, Norwich, with 36. Of course, the mortality in London is exclusive of that awful calamity in the Thames on Tuesday, when over 600 were drowned by the sinking of the *Princess Alice*.

There were but fourteen deaths throughout the United Kingdom from small-pox, 7 in Dublin, 6 in London, and 1 in Hull. Scarlet fever was fatally prevalent in Birmingham, Sheffield, Liverpool, Salford, and Newcastle-upon-Tyne. The deaths from enteric fever showed excess in Hull, Sunderland, and Newcastle-upon-Tyne. Diarrhœa showed a further decline in the number of deaths during the past few weeks, the fatal cases being considerably under the usual average.

There is a considerable opposition to the Vaccination Act on the part of some of the inhabitants of Tring, and the Berkhempstead Board of Guardians have summoned a batch of offenders before the local magistrates. Mr. Evans, the chairman, said the magistrates were bound to carry out the law, and when they found a number of people leagued together to resist it, like the defendants, it made matters rather worse. The usual order was made in every case, and the defendants had also to pay costs.

The terrible epidemic of yellow fever in the southern districts of the United States shows no signs of abatement. At New Orleans, Memphis, Vicksburg, &c., the fresh cases number about two hundred per diem in each town, and the state of frenzy of one portion and that of blank despair on the other part of the populations can be better imagined that described.

The *Archiv der Heilkunde*, for June 15th, contains an admirable biographical notice of the late Dr. C. B. A. Wunderlich, the founder of scientific medical thermometry, from the pen of Professor O. Heubner. All who read it must lay it down with a deep respect for the personal character of this profound investigator.

The village of Kollmar, near Gluckstadt, in Holstein, which is situated in a district reputed for its healthiness, has just witnessed the diamond wedding, or the 75th marriage anniversary of two of its 1,400 parishioners. two more diamond weddings are impending, and the last fourteen years have seen ten such celebrations there.

There is an unusual mortality at Copenhagen amongst children from a gastric epidemic. At the garrison half a battalion of Foot guards are in hospital, causing great anxiety. The general health, as proved by the weekly official returns, is satisfactory. No fresh cases are reported, the cholera in Sweden being probably suppressed.

Cremation becomes optional in Gotha on the 1st of October, and a building has been erected for the purpose. The body of an engineer named Stier will be exhumed, and will be the first subjected to the process.

Correspondence.

THE ARMY MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Whilst agreeing with the spirit of your article on the Army Medical Department, and thanking you for your energetic protest against the proposal of the *Lancet*, I regret you have used the term sentimental grievance, as applied to rank and precedence at mess and on duty. I can assure you that much of the dissatisfaction has arisen from not having our position in the service better defined, and from our not having proper military rank.

I could quote numberless instances and stories of great injustice springing from this defect, and I hold, it may be wrongly, that we shall not be contented until this difficulty is overcome.

I hope you will not imagine I desire military command; I do not. I should like to abolish our present sham military rank, substituting the system at present in force in America and Italy. This will not interfere with the combatant branch of the army, or clash in any way with existing regulations as regards the executive.

Trusting that if Colonel Stanley should initiate a new Warrant, he will make some provisions for leaving us our proper rank. I am, yours truly,

September, 1878. A Surgeon-Major.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—My son, who is a student of medicine, has forwarded to me a copy of your paper of the 4th inst., in which there appears a long and able article on the present state of the Army Medical Department. He having almost completed his medical studies, is desirous of serving Her Most Gracious Majesty in the capacity of an army surgeon, but the state of chaos now reigning in the department, and the very different circumstances under which army surgeons now serve, compared with what I myself can remember some years ago, causes me to hesitate about acceding to his wishes. There are, of course, many points in your excellent leader which are of paramount importance to the medical officers and the army generally; but writing as a father, desirous of seeing his son's position and future prospects in some degree assured, there are two points above all others of primary importance to me:

1. Security of appointment, as in old days, while of good conduct and efficient. And—

2. Connection with a regiment, during at least the earlier years of service, and at a time when the present "solitary system" is likely, in very many cases, to exert a baneful influence on a young man's career in life.

Yours, &c.,

Bath, Sept. 9th, 1878. A Retired Field Officer.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Accept my congratulations on your very able and interesting article on the Army Medical Department in this day's issue. Your leader-writer has carefully quartered the

whole ground, and while steering clear of the quicksands of sentimental grievances, brought the real causes, which are rapidly and surely disintegrating the Army Medical Department, into the foreground.

You do well to expose the tergiversation of the *Lancet* on this important matter. The paper to which we are indebted for the phrase "sweepings of the Irish schools" (see back numbers of *Lancet*), ought to be the last to advocate a scheme which will not only fill the department with Irish sweepings, but English and Scotch also. There is in Paris a class of men who earn a precarious livelihood by pursuing candle-light investigations into the mounds of rubbish, collected in the various quarters of the city. I would suggest to the author of the *Lancet* scheme, that a careful performance of the office of *chiffonnier* amongst the collected sweepings of the schools, ought, in all conscience, to be previously gone through, with a view of foisting on the army the best preserved and least noisome of the "selections from the gutter."

Yours, &c.,

London, 4th Sept. 1878. ADMINISTRATIVE, A.M.D.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—After issuing numerous abortive Warrants, the Army Medical Department is as unpopular as ever. The bait of £1,000 after ten years' service has not proved sufficiently attractive, and I am pleased the profession is in such a position as to be able to refuse this offer.

The inducements to enter the army were generally considered to be the social life and position, and the certainty of a regular, though moderate income. Times have changed since the late Lord Herbert of Lea said he could get officers (and surgeons) even though he gave them no pay.

In a great national emergency, I have no doubt, surgeons would be forthcoming, and our experience of foreign battle-fields and wars strengthen this fact, so much to the credit of our profession. But looking at the question practically, and from an utilitarian point of view, can we expect young men to enter the service when there is no security for the future wretched pay, and an unstable social condition? The stern logic of facts must convince Colonel Stanley that there must be some deep-seated ulcer in the department when vacancies cannot be filled up, and when it is seriously proposed to abolish the test of competition for admission. The thanks of the army medical officers are due to you, for resisting this proposed innovation. It is an Imperial question, and though Parliament is not sitting, I trust some members of the House will think it worthy of their attention, and ventilate their objections in some of the leading organs of public opinion.

Yours truly,

Sept. 5th, 1878. B. DUBIOUS, M.R.C.S.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—On perusing your interesting article of the 4th Sept., I was reminded of an inquiry made by me some short time since amongst fellow-students as to the reason why so few of our number are to be caught by the glittering baits of the Army Medical people, and as the subject appears again to be working to the front, I will, with your kind permission, summarise their and my objections from a student's point of view.

A. Undefined, indefinite, and insecure position.

B. Abolition of regimental appointments. At present a young man is obliged either to "pig it" by himself, or be duly grateful for the semi-contemptuous pity with which a regiment accords him the privilege of using their mess as an honorary member.

C. An almost total restriction put on private leave, and should a man' health break down on foreign service—which I take it in the present overworked state of the department is not an unlikely event—sick leave for a few months, and then, if without money or friends, starvation or the workhouse.

Yours, &c.,

Dublin, Sept. 6, 1878. A MEDICAL STUDENT.

[We regret that pressure on our space will not allow us to publish all the communications we have received on the subject to which we devoted a leader in our last; we have selected a few representing the views of different classes who are interested in the welfare of the Army Medical Department which show how universal the discontent must be. Our correspondents may rest satisfied that we shall not allow the matter to slumber, and as the MEDICAL PRESS AND CIRCULAR has always persistently advocated the just claims of the Army Medical Service, its voice and influence will ever be found on the side of justice and true progress.—ED. M. P. & C.]

ON A PEPTONIC EMULSION OF COD LIVER OIL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—From Claude Bernard's discovery of the action of the pancreatic fluid on fats, and the researches and views of Dr. H. C. Bartlett and Dr. G. Overend, the medical profession have gradually drifted into the idea that pepsine does not affect fats at all. This, no doubt, is an error, as there is every reason to believe that nothing assimilable passes through the stomach which the gastric juice does not more or less affect. Moreover, many physiologists and medical authorities of status, opine, in opposition to the latter two gentlemen's views, that pancreatine passing through the stomach is rendered completely inert, and metamorphosed into some other substance; and if such be the case, *ergo*, it follows that any good effects which followed the administration of pancreatic emulsion, and the so-called "hydroline," or hydrated oil, were due to the mere fact that the oil was presented to the digestive organs in a minutely divided state. If it were presented in an emulsive form by any other means without being saponified, *i.e.*, without having its fatty acids fixed by potass or soda, as desirable results would follow as from pancreatic emulsion or hydrated oil.

There are many ways for emulsifying the oil. Alkalies are objectionable from their chemical action on it, because they neutralise the gastric acids, and from their own individual medicinal properties. What is then required, is a slightly acid and palatable emulsion. This is obtainable by the trifold means of glycerine, wine, and acidified pepsine, as follows:—It is palatable, leaves but the faintest oily taste on the fauces after being swallowed, and never produced eructations in the few cases I saw it exhibited in. Half an ounce of it diluted with an ounce of water will retain a uniform milky appearance for half an hour. It is always better though, to take it without any admixture immediately after meals, in doses of a dessert to two tablespoonfuls.

Cod-liver oil	- -	f℥iv;
Glycerine, Sound sherry	of each	f℥ij;
Pepsine porci	- -	f℥iss;
Dilute muriatic acid	-	f℥j;
Sodium chloride	- -	℥ij.

Agitate, first, the oil with the glycerine in a clean 12 oz. bottle, and add the wine and pepsine, previously mixed, shaking the whole well together; then add the acid and salt. Of course it must always be well shaken together before use, as the oil, though completely emulsified, will float on the top, in appearance like cream.

I have made these few remarks on what, I think, will be found an agreeable and efficient form of exhibiting a naturally repulsive, but most important remedy in the treatment of wasting diseases, as laconically as possible.

Yours, &c.,

J. H. W.

A PATHOLOGICAL CURIOSITY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I send a few notes of the following case, as a pathological curiosity:—

About six months ago, an old man of sixty-eight, came under my care as a dispensary patient, suffering from a bubonic abscess of the right inguinal region, and a number of *chancroid* ulcers on the most prominent member of the genital *triad*, which was greatly swollen and inflamed. By my advice he went into the hospital, where he remained for about two months, and then discharged himself, as he disclaimed the soft impeachment of having courted the disease. During his stay in hospital the abscess, after being opened, became a phagedænic ulcer of huge dimensions, four or five inches long, by about three broad, and so deep as to

threaten to penetrate into the cavity of the abdomen. The ulcers on the member enlarged and coalesced, nearly encircling it, and so deep as to threaten its complete amputation in front of the pubis. But the singular feature of the case is, that about a month ago a new *glans* commenced to grow alongside the original one, which it now equals in size and dimensions every way, only *minus* a prepuce; it has a urethra, through which the urine flows as freely as through the original one, but not along both at the same time.

The ulceration has invaded both glans, and threatens at no distant date the destruction of both. Were it not for the gravity of the case, one could not help looking on the double-headed affair as a humorous *lusus naturæ*.

Can the experience of any of your readers afford a similar instance of Nature's freak in a diseased organ?

Respectfully yours,

SAMUEL STUART.

Donaghadee, 28th August, 1878.

THE DENTAL DIPLOMA OF THE IRISH COLLEGE OF SURGEONS.

THE establishment by the Irish College of Surgeons of the Dental Diploma, the first special qualification created under the provisions of the Dental Bill, has been consummated during the past week, and the first examinations were held on Saturday, Monday, and Tuesday last. Immediately on the passing of the Bill, the Council of the College had initiated active steps towards carrying into effect the clauses which empowered them to establish a license in Dental Surgery. Having considered the subject, and decided upon the subjects of examination, and the restrictions on admission thereto, the further action of the Council was stopped, pending the arrangements for Dental Registration by the General Medical Council, for it was specified by the Act that three of the Examiners must be Registered Dentists, and no means of registration yet existed. The Executive Committee of the General Medical Council having met to adjust the matter, the register was declared open, and the Council of the College then announced its intention of electing examiners and holding examinations as speedily as might be. As the College recess had already been long postponed, in consequence of the meeting of the British Association in Dublin, it became necessary to act with expedition, and to name the earliest possible date for these proceedings, or else to postpone the whole business until the end of November, which was considered very undesirable. Accordingly, Thursday last, the 5th, was named for the election of Examiners, and Saturday for the first examination, and it was ordered that the Court of Examiners consist of three Fellows of the College, and three Registered Dentists, and, inasmuch as a complete discretion is confided to the Court to refuse to admit any applicant to examination or to grant the diploma to him, after examination, without reference to the Council, it was decided to add to the Court the President, the Vice-president, or a member of Council, who shall act as chairman, and be considered to represent the College in the voting. In the method of election, an important, and, we think, very salutary change was made from that hitherto in use in the College. Heretofore, as many of our readers are aware, all Examiners have been elected by the secret vote of seven chosen by lot from the twenty-one Councillors, and it was found that, on many occasions, the vote of these seven gentleman did not at all represent the opinion either of the Council or of the Fellows at large. Therefore, that system has now been abandoned, *quoad* the Dental Court of Examiners, and the selection is made by the entire Council. We regard this decision of the Council as of much importance, because it is equivalent to an expression of feeling against the old system, and a pledge that, on the first opportunity, that system will be set aside. The registered dentists who were candidates for a seat on the Court were: Messrs. Eskell, Corbet, M.R.C.S.E., McClean, L.F.P.S., Stack, F.R.C.S.I., Pearsall, F.R.C.S.I., Sherlock, L.R.C.S, and Dowling. Messrs. Stack, Pearsall, and Sherlock were elected. The Fellows of the College who presented themselves for the office of examiner in the surgical, anatomical, and physiological subjects were: Messrs. Richardson, Edward Stoker, John Barker, Thornley Stoker, O'Grady, Roe, and P. C. Little. Drs. Richardson, Edward Stoker, and O'Grady were chosen.

Every Candidate for the Licence in Dental Surgery is obliged to produce testimony of two Fellows, Members, or Licentiates of a College by Surgeons, and one Member of the Dental Diploma Committee, or of the Odontological Society, that he "is of good moral character, and has not, during the past two years," attracted business as a dentist by advertising or other unbecoming practices; and the Board has the absolute power to refuse the application of any Candidate.

The examination consists of the anatomy, physiology, and pathology of the teeth, jaws, and surrounding parts, and of mechanical dentistry, and shall be partly written and partly oral.

Each Licentiate shall make and subscribe the following declaration:—

I———, of———, hereby delare that I am twenty-one years of age, that so long as I hold the Diploma in Dental Surgery of the Royal College of Surgeons in Ireland, I shall not attract business by advertising or any other unbecoming practice, and that I agree that such Diploma shall be cancelled on it being proven that I have done so.

THE L.D.S., R.C.S.I.

WE understand that for the examinations in Dental Surgery held by the Royal College of Surgeons in Ireland on Saturday, Monday, and Tuesday last, fifty-five gentlemen presented themselves, two of whom were not admitted to examination. The written examination took place on Saturday, and the *viva voce* on Monday. At the hour of going to press the result had not transpired.

TESTIMONIAL TO DR. G. MAYBURY, KENMARE DISPENSARY.

WE understand that there is now to be seen at the establishment of Messrs. Waterhouse, Dame Street, Dublin, a handsome piece of plate which the members of the Kenmare Dispensary Committee intend to present, with a suitable inscription, to their lately superannuated medical officer, Dr. George M. Maybury.

The duties incident to the office of a dispensary doctor are often of a trying and laborious character, and always bring with them a heavy weight of responsibility. The care and anxiety which the proper discharge of these duties imposes upon the conscientious medical officer would, sometimes, be almost unendurable, but that the doctor is cheered on and supported by the good feeling and friendly co-operation of the members of his committee. And when, at the close of a long time of service, he retires with a pension, carrying with him, also, the esteem and good-will of those in whose service he spent the best years of his life, accompanied, as in this instance, by the presentation of a handsome piece of plate, he forgets anything that was troublesome or disagree-

able in a position which has finally brought him so gratifying and so prized a reward.

We sincerely congratulate Dr. Maybury upon having received this well-deserved tribute to his worth and ability.

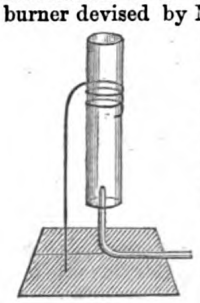
Novelties.

SAVORY AND MOORE'S GELATINE LAMELS.

It is with great pleasure that we call the attention of our readers to one of the most elegant and useful novelties that the skill of the pharmacist has ever introduced to the notice of the profession. This consists of a series of medicated gelatine lamels, or thin sheets of uniform thickness, each of which is about the size of a lady's visiting card, and contains several doses of some active drug. They are so portable that in the compass of a small pocket-case (which is supplied with the lamels) a number of the most useful medicines may be carried about. Each sheet of the lamels is subdivided into twenty-four small squares, each square containing one dose of the medicine with which the gelatine sheet is impregnated. Thus, there are sheets containing respectively the muriate of morphia, jalapine, sulphate of quinine, podophyllin, calomel, extract of nux vomica, and various other active remedies. These lamels are, moreover, as easily taken as they are portable. All that the patient has to do is to cut off the required dose, float it on a little water, and swallow it. Although this method of dispensing medicines is chiefly for the use of travellers, we need scarcely say that they will be of the greatest convenience both to the physician who may wish to keep a few medicines by him in case of emergency, to the general practitioner who may live far away from many of his patients, and even to patients themselves, especially if they live in the country out of reach of any surgery or chemist's shop.

ON A NEW SIMPLE BUNSEN'S BURNER.

In our number for July 24 we gave a description and illustration of a very simple and easily made Bunsen's burner devised by Mr. P. Ebell. Since then, a still more simple contrivance has been made by Mr. Rud. Biedermann (in *Dingl. Pol. Journ.*) A large cork is divided by a horizontal section into two halves. Into the lower half is cut a gutter, intended to receive the gas-tube. The upper half is perforated in the centre to allow the upright end of the gas-tube to passs out. Both sections of cork are joined together with glue or sealing wax. A tube of hard glass is then fixed over it in the manner shown in the cut, by attaching it to a wire, which is spirally wound around it, and one end of which is fastened in the cork. By raising or lowering the glass tube the flame may be made larger or smaller. The burner may be made steadier by attaching a piece of lead to the cork.



NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

PHYSICIANS' FEES.

F.R.C.S., replying to "A Physician" in our last, considers that he is too modest in his scale of fees if he be practising purely as a consulting physician. Such a scale should be that of a general practitioner in first-class practice; whereas, a consulting physician or surgeon should make his fee two guineas for the first visit, and one guinea for all subsequent visits. F.R.C.S. says that since he has raised his fees to this scale he has lost on the *number* of patients, but has more than gained on the amount, and regrets that the rise is not universal.

Dr. Cassells.—Many thanks.

A Member of the Association.—The matter is at present in obscurity. Report has it that the gentleman mentioned is endeavouring to resuscitate the periodical at his own risk, but we give him credit for too much shrewdness to attempt this. We do not know how it will affect his official position if the report be true.

Mr. Bell should write to the Secretary of the College; like our correspondent we fail to understand the objection.

A Candidate will find all he wants to know in the next (Student's) number of our journal.

A M.—Can a magistrate and an *ex-officio* guardian vote on a dispensary committee, he not living within the district, nor his name given in the list published as members of the committee? I should state that the person I refer to resides in the parish from whence the district takes its name.

[Under Clause 7 of the Med. Charities Act ("Irish Med. Directory," page 496) the guardians are directed to elect a sufficient number of ratepayers in each district . . . who, together with the *ex-officio* and elected guardians of the poor *resident or being the owners or occupiers of property therein, shall be a committee for the management of the dispensary of such district.* It appears from this that it is sufficient for a person to be a guardian and the possessor of property in the district to constitute him a committee-man.—Ed. M. P. & C.]

VACANCIES.

Brown Sanitary Institution. Professor Superintendent. Salary attached, £300 per annum, with residence and an assistant. (See Advt.)

Essex and Colchester Hospital.—House Surgeon and Apothecary. Salary, £100, with board and lodging. Applications, with testimonials, to the Committee by September 12.

General Infirmary, Leeds.—House Surgeon. Salary, £100, with board and residence. Applications, with testimonials, to Dr. Heaton, at the Infirmary, by September 12.

Holborn Union.—Resident Medical Superintendent. Salary, £300 per annum. Applications endorsed "Medical Superintendent," to be addressed to the Clerk of the Guardians. Offices, Gray's Inn Road, W.C.

Leicester Infirmary.—House Surgeon. Salary commencing at £120, with board and apartments. Address the Secretary.

Lincoln County Hospital.—House Surgeon. Salary, £100, with board and lodging. Applications, with testimonials, to the Secretary by September 23.

St. Luke's Hospital.—Clinical Assistant. Apartments and board provided. Applications to the Secretary, St. Luke's Hospital, E.C.

APPOINTMENTS.

Battle, W. H., M.R.C.S., House Physician to St. Thomas's Hospital.

Castle, H., M.R.C.S., Assistant House Surgeon to St. Thomas's Hospital.

Crampton, J. S., L.R.C.P.Ed., L.R.C.S.Ed., Assistant Medical Officer to the Newcastle-upon-Tyne Lunatic Asylum.

Edgelow, S. H., M.R.C.S.E., Assistant House Surgeon to the Kent and Canterbury Hospital and Dispensary.

Gimlette, G. H. D., M.R.C.S., House Physician to St. Thomas's Hospital.

Goyder, C. M., Junior House Surgeon to the Newcastle-upon-Tyne Infirmary.

Groome, W. W., M.R.C.S., Assistant House Physician to St. Thomas's Hospital.

Haslam, W. F., M.R.C.S., House Surgeon to St. Thomas's Hospital.

Little, D., M.D.Ed., L.R.C.S.Ed., Ophthalmic Surgeon to the Manchester Royal Infirmary and Dispensary.

Marsh, F., M.R.C.S.E., House Surgeon and Secretary to the Staffordshire General Infirmary.

Monro, W., M.D. St. And., L.R.C.S.Ed., a Medical Officer to the Arbroath Infirmary and Dispensary.

Pughe, R. N., M.B.Lond., F.R.C.S.E., Honorary Assistant Medical Officer to the Infirmary for Children, Liverpool.

Smith, H. U., M.B.Lond., M.R.C.S., House Surgeon to St. Thomas's Hospital.

Takaki, K., L.R.C.P., M.R.C.S., Senior Assistant House Physician to St. Thomas's Hospital.

Tyrrell, W., L.R.C.P., M.R.C.S., Resident Accoucheur to St. Thomas's Hospital.

Marriages.

Collins—Brasher.—Sept. 4, at St. Paul's Church, Derby, Charles E. Collins, M.R.C.S., L.R.C.P., of East Grinstead, to Lucy Ellen, daughter of the Rev. S. B. Brasher, M.A., vicar of St. Paul's, Derby.

Skipworth—Hadley.—Sept. 3, at St. Michael's Church, Handsworth, Herbert Skipworth, M.R.C.S., of Leicester, to Florence Mary, daughter of J. J. Hadley, M.R.C.S., of Handsworth.

Deaths.

Blomfield.—On August 30, at Verulam Buildings, Gray's Inn, Andrew Muskett Blomfield, M.R.C.S.E., Surgeon-Major in the Bombay Army, aged 47.

Davies.—On August 25, at Reynoldston, Glamorganshire, Daniel Davies, Surgeon, in practice before August 1, 1815, aged 83.

Day.—On August 24, at Little Meolse, Cheshire, Henry Day, M.R.C.S., aged 53.

Jones.—On Sept. 2, at Brackley, Northamptonshire, Richard Jones, F.R.C.S.E., aged 77.

Munro.—On August 27, at Holgate Villa, near York, Dr. Alexander Munro, aged 68.

Pitman.—On August 24, at Frankfort House, Upper Holloway, Fredk. Erkel, infant son of the late Dr. Pitman, of Acacia House, Highgate Hill.

Robertson.—On August 25, at Cambray Villa, Cheltenham, Lennox Robertson, M.R.C.P.Ed., aged 41.

Wollaston.—On Sept. 1, at his residence, Lyme Regis, Dorset, from accident while driving, Richard Gulston Wollaston, M.R.C.S., L.S.A., L.R.C.P.Ed., aged 64.

IRISH POOR-LAW INTELLIGENCE.

THE ABUSES OF DISPENSARY MEDICAL RELIEF IN IRELAND.

We published a few weeks since a letter addressed by the Council of the Irish Medical Association to the Irish Local Government Board on this subject, in which the Board was requested to call the attention of guardians and committee-men to the illegality of issuing tickets by deputy. We are glad to observe that the Local Government Board has complied with this request by issuing the following letter :—

TICKETS FOR MEDICAL RELIEF.

Local Government Board, Dublin,
31st August, 1878.

Sir,—The attention of the Local Government Board for Ireland has been drawn to irregularities, which are stated to be of frequent occurrence, in the issue of tickets for medical relief under the provisions of the Irish Medical Charities Act. These irregularities are stated to be as follows :—

1. A practice on the part of persons who are legally authorised to issue tickets for medical relief of signing blank medical relief tickets *en bloc*, leaving them to be filled up and issued by other persons.

2. The issue of tickets for medical relief for persons who cannot fairly be considered to be "poor persons" within the meaning of that term, as used in the 9th section of the Medical Charities Act.

In regard to the first of these irregularities, there can be no doubt that the practice is not only contrary to the Dispensary Regulations, in regard to the issue of tickets for medical relief, but is also at variance with the provisions of the Medical Charities Act, the 9th section of which empowers certain persons, therein described, to afford medical relief by tickets addressed to the medical officer, but does not contain any provision authorising the persons empowered to issue tickets to delegate that power to other persons.

In regard to the class of persons to whom tickets for medical relief may be issued, the Medical Charities Act has, no doubt, placed the responsibility of determining whether an applicant for medical relief is or is not a "poor person" within the meaning of the Act, upon the persons who are authorised to afford such relief at their discretion ; but it is obvious that that discretion ought to be exercised so as to prevent, as far as possible, the abuse complained of, thereby charging upon the rates the cost of medical relief, which ought to be borne by the patient or his friends, and burthening the medical officer with the duty of affording gratuitous medical aid to persons for whose benefit the provisions of the Medical Charities Act were not intended by the Legislature.

The Board have thought it right to bring this subject under the consideration of the Dispensary Committee, in the hope that they will, by every means within their power, discourage the abuses referred to.

The Board desire to add in reference to this subject that they have sometimes received communications from members of Dispensary Committees and others, evincing a desire to establish a system by which tickets for medical relief might be issued subject to the payment of a regulated scale of fees for persons who, though not strictly "poor persons," could not afford to pay the usual fees charged for medical attendance. Such a system, however, would not be in accordance with the provisions of the Medical Charities Act, and could not be made compulsory upon the medical officer ; but the Board think that the existence of such a desire shows that, to some extent, the abuse complained of may be traced to the scale of fees charged to private patients, and that it might be deserving of consideration whether some arrangement might not be made by which such fees would be graduated in some way in accordance with the circumstances of the patients.

By Order of the Board,
B. Banks, Secretary.

We are pleased to note the readiness which the Local Government Board has shown to discourage the abuses of which the Irish Medical Association complained, but we take some exception to the suggestion which the last paragraph contains—that there would be less abuses if the doctors would accept reasonable fees. We can state that it is an entirely erroneous supposition that Poor-law medical officers as a rule exact a guinea visit or any fee which is unreasonable in price. We have every reason to suppose that the average of all visits paid yield a fee of considerably less than five shillings a visit. But it is also a fact that the very persons who avail themselves with most readiness of the red ticket are those who are well able to pay, not five shillings, but £1 1s., and whom it would be no charity to visit gratuitously.

GALWAY UNION.

THE ATTENDANCE OF THE MEDICAL OFFICERS ON THE SMALL-POX PATIENTS.

The following letter was read :—

"Local Government Board, Dublin,
8th August, 1878.

"Sir,—The Local Government Board for Ireland acknowledge the receipt of minutes of proceedings of the Board of Guardians of Galway Union, on the 2nd inst., and enclosing copies of the explanations given by Drs. Colahan and Clayton, medical officers, in regard to their limited attendance at the workhouse hospital, to which attention was recently drawn by the inspector, Dr. Brodie.

"Having carefully considered the explanations, the

Local Government Board must state that they regard them as by no means satisfactory.

"During the period referred to by Dr. Brodie there were a number of patients in hospital labouring under heavy diseases, ending, in a large proportion of the cases, in death.

"Each case required to be inquired into, carefully examined, prescribed for, and directions given as to diet and general treatment, and such duty could not in the opinion of the Local Government Board have been done in the short time devoted by the medical officers in their duty visit.

"The Local Government Board caution the medical officers that should their notice be again directed to similar inattention, on the part of either of them, they will take more serious steps in the matter.

"The Local Government Board most particularly refer to Dr. Colahan, who, it seems, has frequently discharged his duty by deputy; and in his explanation has expressed himself in an unbecoming and insubordinate manner in reference to the inspector, Dr. Brodie, who, in the opinion of the Local Government Board, has been influenced only by a desire to see medical aid properly administered to the sick poor, by the medical officers of the workhouse.

"B. BANKS, Secretary.

"The Clerk, Galway Union."

Mr. Stack read the time of attendance of Dr. Colahan, which showed that the majority of his visits ranged from twenty-five minutes to half an hour.

Dr. Brodie—What I stated to the board was, that I discovered on reference to the porter's book that from the 1st of June the attendance of the doctors at the small-pox hospital, averaged from ten to fifteen minutes—and I considered that too little.

Dr. Colahan—But this is exactly where the mistake lies. Figures during the month do not apply to the wards under my charge, for it was not till the 6th of July that small-pox patients were admitted to my wards, and never since then did my visits come down to ten minutes.

Dr. Brodie (referring to his notes)—I find that frequently during the month of June ten minutes represented the duration of Dr. Clayton's visits and also of Dr. Grealy, when acting deputy for Dr. Colahan.

Dr. Colahan—I cannot be responsible for the acts of my deputy when I am absent through illness—and I feel certain Dr. Grealy gave the full time required for discharging the duties.

Mr. Ferdinand proposed:—"That this Board regrets that any misunderstanding should exist between the Local Government Inspector, Dr. Brodie, and the medical officers of the workhouse hospital. And that while we recognise the zeal of Dr. Brodie, we must express our fullest satisfaction at the manner in which the medical officers, Dr. Colahan and Dr. Clayton, have discharged their duties."

Mr. Burke—I agree with that resolution, and will vote with it, if Dr. Colahan will only see fit to make some apology to Dr. Brodie for the language in which he concluded his reply.

Dr. Colahan—There is not a man in this room, who makes use of language requiring an explanation or an apology so seldom as I do, and I don't think this case is an exception. However, if there is any gentleman in the room who will show me what it is I am to apologise for, I will make a most ample one.

Mr. Ferdinand said he really did not see what Dr. Colahan had to apologise for.

Dr. Colahan—I will go further. I will leave it to Mr. Burke himself, to show me what I have to apologise for.

Mr. Burke—I can't tell you what there is in your letter to apologise for; but I say, it displays bad taste, and I think if it were only professional etiquette between one gentleman and another it would be well to apologise.

Dr. Colahan—I am sorry to say there has been very little etiquette in this matter; if an inspection of my wards were made first and the report afterwards then we could talk of etiquette.

Dr. Brodie—I had an important duty to perform, and I was bound to discharge it. Only for the porter's book I would know very little of the number of deaths from small-pox, the number of fresh cases, and everything connected with the epidemic.

Dr. Colahan—Quite right, Dr. Brodie: the porter's book gives most valuable information on those points, but nothing whatever as to the manner in which the patients are treated by the medical officers and the nurses. I must also say I have a most important duty to perform, and it is this—to defend my own reputation.

A poll was then taken when there voted:—For the resolution 11, against 2.

The Chairman declared the resolution carried, and the subject dropped.

DONAGHMORE UNION.

PAYMENT OF SUBSTITUTES.

A LONG correspondence was read with reference to the illness of Dr. White, Borris-in-Ossory, and the appointment of Dr. Smith as his substitute. The committee of the Borris-in-Ossory dispensary appointed Dr. Smith to do the temporary duty at the rate of 10s. 6d. per day. Dr. Smith certified that Dr. White was attacked with gout in his left ankle, and was incapacitated from doing any work. The minutes of the committee were duly forwarded to the Local Government Board, who said if the committee could get no other person than Dr. Smith to perform Dr. White's duty they would offer no objection, but they referred the committee at the same time to their letter wherein they state that they could not sanction such an arrangement again, the case being in every way similar to what it is now. In enclosing these documents the hon. secretary of the committee writes:—"The repeated illnesses of Dr. White, and this calling for extraneous help, requires serious consideration as to whether the time has not come for him to contribute to the payment of the medical officer nominated by him."

Mr. Owen pointed out that for some time back Dr. White's illnesses were very frequent. If he resigned, he would retire on a pension, and eventually he would have to retire if things went on this way.

The Chairman said the way to bring matters to a crisis was to let Dr. White get somebody to do his duty and pay him himself. The feeling of the dispensary committee was one of dissatisfaction at his frequent illnesses of late. Was it the opinion of the board that they write to Dr. White to say he should provide a substitute at his own expense?

Dr. Smith said when Dr. White came before them and produced a *bona-fide* certificate of ill health, as he had done, they were bound to provide a substitute. He had been forty years in the service of the board, and for thirty-five years he never asked one hour's leave. He (Dr. Smith) believed that Dr. White, and many men like him, who were unable to perform their duty from infirmity and illness and old age, would retire if they were certain of a retiring allowance; but first they would have to give up their situation, and then ask the board for a pension, and it was perfectly open to the board to say they would or would not give it.

The Chairman believed there was not a single guardian who would refuse to give Dr. White a retiring allowance. (Hear, hear.)

Dr. Smith—I do not myself think there is; but we see these things done every other day. If you would permit me to make a suggestion, I would say that you should provide a substitute for Dr. White until he is able to resume duty, and then let him decide whether he will avail of a retiring pension or not.

Ultimately an additional month was given to Dr. White.

Dr. Smith said the present state of his health made it imperative on him to ask for one month's leave of absence, and he put forward the name of Dr. Charles F. Green as his *locum tenens*. It was with the greatest reluctance he (Dr. Smith) came before them, but some of the most competent medical men in the kingdom had advised him that he required absolute rest for the benefit of his health. He never asked for a month's leave before.

Mr. Owen moved that a month's leave be granted.

Mr. Caldbeck seconded the proposition; and as regarded the question of payment, he pointed to a recent case in the Abbeyleix union, where the doctor (Dr. Palmer, of the Durrow dispensary), got a month's leave, and his substitute was paid three guineas a week. Here Dr. Smith's substitute had the workhouse to attend to in addition to his district, and it was for the board to say what additional sum they would allow for that. He suggested that the entire payment be four guineas a week.

Mr. Dunphy thought eight guineas a week too much to give to any one doctor.

Dr. Smith said it should be borne in mind that 10s. 6d. a day would be absorbed in car hire at the very lowest, so that practically the eight guineas only came to half that.

The Clerk said that the Local Government Board would probably raise an objection to one doctor doing the duties of the whole union, as pointed out in their letter of November.

Mr. Caldbeck proposed that Dr. Smith's substitute be paid four guineas a week.

This was carried, and the board then proceeded to consider the question of Dr. White's substitute.

The Chairman thought the wisest course would be to have the same gentleman do the duties of Dr. White's district also.

Clerk—And allow him travelling expenses to Borris?

Dr. Smith—And to do the duty of Borris for nothing?

The Chairman himself thought it would not be fair to ask him to do the duty for nothing, and suggested that he be allowed the same as they allowed Dr. Smith for going to Borris, namely, 10s. 6d. a day.

GALWAY GUARDIANS.

THE DOCTOR AND THE STIMULANTS.

THE Clerk read the account of stimulants used for the past week.

Mr. Davis said he did not think it much use to be advertising the stimulants used.

Mr. G. Burke said that advertising did not seem to have the slightest effect on the doctors. That board should take more decisive measures. They should come into direct contact with the Local Government Board by refusing the supplies. The board of guardians might be dismissed, and paid guardians substituted, but they could appeal to Parliament, and bring public opinion to bear on the conduct of the medical officers. It was a serious matter, and he intended to ask that board to take action on the matter.

Mr. O'Flaherty said it was monstrous. He would support Mr. Burke in every way in putting an end to such work. The ratepayers should protest against such expenditure for stimulants.

Mr. G. Burke said the ratepayers should protest at public meeting if necessary, but that board should first take action by stopping the supplies.

Dr. Brodie said that neither the board of guardians nor the Local Government Board had any control over the medical officers.

Mr. O'Flaherty—A stop should be put to them.

Mr. Ferdinand said he must protest strongly against the observations of Mr. Burke. He believed the ratepayers, if they were consulted on the matter, would not object to the poor in the hospitals being treated properly by the medical officers.

The subject dropped.

KILMACKEVOGUE DISPENSARY.

LAST week a special meeting of the members of this committee was held to consider a letter from the Local Government Board, complaining of Dr. Cane for neglecting to answer a charge, and calling on him to resign.

The charge set down by the Local Government Board is for Dr. Cane's continued neglect in answering the charges preferred against him. The charge was absenting himself from Slieverne and Glenmore on a certain occasion. The Local Government Board complained that Dr. Cane neither denied nor explained that charge. The letter from the Local Government Board asked Dr. Cane to place his resignation in the hands of the committee.

The Chairman read the correspondence which passed between Dr. Cane and the Local Government Board, amongst which was a letter from Dr. Cane, asking for an extract copy of a letter received from one Sheehan. To Dr. Cane's letter the Local Government Board replied, refusing a copy of the letter in question, and asking Dr. Cane, as he had not answered the charge in question, to place his resignation in the hands of the committee. To this Dr. Cane replied, stating that on 16th Oct., 1877, he was processed to the Piltown quarter sessions, was examined in court, and had the case against him dismissed. On the 37th Nov., 1877, he was taken suddenly ill in the morning and could not leave his bed that day. There was no time for a meeting of the committee—and no necessity, as he was able to attend to his duties the following day.

Mr. Power—I think the charge is for not answering the letter of the Local Government Board.

Major O'Gorman—How many letters did you receive from the Local Government Board that you did not answer?

Dr. Cane—I answered them all, but there was one of them I did not answer in time. They complain of delay in not answering the last letter. I was merely writing for a copy of the letter that I asked for. My time is very fully taken up with my dispensary duties, and I consider it very hard to be continually answering frivolous charges.

Major O'Gorman—I think it would be very hard to deprive this gentleman of his situation. The Local Government Board refused to give him a copy of a charge that was in their possession.

The following resolution was passed unanimously:—

"The Kilmackevogue Dispensary Committee, having assembled at Slieverne Committee Rooms, eleven members being present, and having heard the charge preferred against Dr. Cane, medical officer of the district, are of opinion that though the charge of delay in replying to the letters sent to him by the Local Goverment Board has to some extent been proved, the committee are of opinion that to deprive Dr. Cane of his situation would be too severe a measure, especially in presence of the apology that Dr. Cane has offered to the committee for his seeming neglect, and his sincere promise not to permit a recurrence of it."

Dr. Cane—In fact I'm almost tired of answering those frivolous charges.

MULLINAVAT DISPENSARY.

A SPECIAL meeting of the Mullinavat Dispensary Committee was held last week to consider charges preferred by the Local Government Board of Ireland against Dr. Cane, medical officer of that district. Amongst the members present was Major O'Gorman, M.P. It appeared

from the proceedings that the Local Government Board complained that Dr. Cane had been guilty of disrespect towards them, because he delayed in answering communications addressed to him, and they consequently called on him to resign.

Dr. Cane, at the meeting to-day, explained that he meant no disrespect towards the Local Goverment Board by the delay complained of; that his duties were of a very extended and onerous nature, and that frivolous charges were preferred against him by individuals who were neither recipients of relief nor ratepayers.

Major O'Gorman thought it a very hard thing that if charges were preferred against a dispensary medical officer because he asked the Local Government Board to supply him with an exact copy of the letter containing the complaint, that he should be called on to resign. Such a thing could not be tolerated. He held that Dr. Cane had not been guilty of any misconduct which would justify the Local Government Board in calling on him to resign.

The committee, which was a very large one, then passed three resolutions expressing the fullest confidence in Dr. Cane, and pronouncing the charges pre-ferred against him from time to time as spiteful and frivolous.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF AUGUST, 1878.

August 5th.—Haslett, John Courtenay; Merview, Duncairn Park, Belfast; M.D. Q. Univ. Irel.

5th.—Garde, Henry Croker; Kilmahon Glebe, Midleton, co. Cork; Lic. R. Coll. Surg. Edin. 1878; Lic. R. Coll. Phys. Edin. 1878, Lic. Apoth. Hall Dub. 1877.

10th.—Jacob, James Bostock; Growtown House, Taghmon, co. Wexford; M.B. Univ. Dub. 1878, Lic. R. Coll. Surg. Irel. 1878, Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

13th.—Carmichael, John; 30 Royal Terrace, West Kingstown, co. Dublin; Lic. R. Coll. Surg. Irel. 1877, Lic. R. Coll. Phys. Edin. 1878, Lic. Mid. K. Q. Coll. Phys. Irel. 1878.

15th.—Martyn, Robert Joseph; Richmond Hospital, Dublin; Lic. R. Coll. Surg. Irel. 1877, Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

12th.—Barrington, Frederick Albert; Glendwid, Cabinteely, co. Dublin; Lic. 1878, and Lic. Mid. 1878 K. Q. Coll. Phys. Irel., Lic. R. Coll. Surg. Irel. 1878.

13th.—Kevin, Charles; Royal Hospital, Belfast; M.D. 1878 and M.Ch. 1878 Q. Univ. Irel.

14th.—Hadden, Robert Evans; Skibbereen, co. Cork; M.D. 1878 and Mast. Surg. 1878 Q. Univ. Irel.

14th.—Bennet, Alfred Constantine; 66 Patrick Street, Cork; M.D. and M.Ch. Q. Univ. Irel. 1878.

14th.—Allison, Charles Warke; Magilligon, co. Derry; M.D. Q. Univ. 1878.

16th.—Fennell, James Patrick; Dudley, Worcestershire; Lic. R. Coll. Surg. Irel. 1878.

20th.—Megarry, John Wesley; Kilcorig, Lisburn, co. Antrim; M.D. Q. Univ. Irel. 1877.

16th.—Pybus, John Alfred; Roslyn Terrace, Stockton-on-Tees; Lic. Soc. Apoth. Lond. 1878.

21st.—Gabbett, Henry Singer; 8 Merrion Row, Dublin; M.B. Univ. Dub 1878, Lic. R. Coll. Surg. Irel. 1878, Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

22nd.—Kehoe, Matthew Joseph; Woodfield and Roebuck, Dundrum, co. Dublin; Lic. R. Coll. Surg. Irel. 1877, Lic. 1877 and Lic. Mid. 1877 K. Q. Coll. Phys. Irel.

27th.—Walsh, John Joseph; Mountain Castle, Cappoquin, Cahir; Lic. R. Coll. Surg. Irel. 1877, Lic. K. Q. Coll. Phys. Irel. 1878.

28th.—Drury, Maurice O'Connor; 21 Harcourt Street, Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. 1877 and Lic. Mid. 1877 K. Q. Coll. Phys. Irel.

The Medical Press & Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 18, 1878.

STUDENTS' NUMBER.

PART I.—The Future of the Student in Private Practice, or the Public Services.

PART II.—The Education and Qualification of the Student in the United Kingdom.

PREFATORY.

IT is not improbable that the Number which we present this day for the guidance of Students in Medicine will be the last of its epoch, and that when next year we are called upon to instruct those who propose entering our profession, we shall have to produce for their information the records of a state of medico-educational affairs entirely new and distinct from that which we publish to-day. The varying systems of medical education which it has been our duty to print in more or less detail are on their death-bed, and the coming system will be one of uniformity and simplicity. The Medical Acts Amendment Bill, which very nearly became the law of the land last July, will, in all probability, be passed during the next session of Parliament, and will relieve us of the task of epitomising the differing arrangements of nineteen separate licensing bodies, with their different curricula, fees, and diplomas. The new condition of things will be one conjoint examination for each division of the kingdom, with a single curriculum, and—we hope—n uniform fee. When the Bill becomes law, the student will enter the profession by one of three portals, which will be more or less uniform in their standard of education, and will be obliged to satisfy as to his competency a Board of Examiners, to which all the Universities and licensing corporations will contribute members, and will have the credit of holding the qualifications for practice now issued by each of these bodies separately.

We have again to notice the development of advanced methods of professional teaching to which we referred last and the previous years. The sciences cognate to medicine are receiving a degree of attention which they have long deserved, but never previously received. Nor can we fail to notice a like improvement in the medical and surgical education of the student, or fail to mark the difference between the quaiifications with which the medical practitioner was formerly satisfied, and those which he is now anxious to take. The medical man who twenty years ago thought himself fully qualified with one diploma, now takes two, with perhaps a good degree into the bargain; and he who formerly only knew how to use the stethoscope and was satisfied with a very superficial knowledge of medicine and surgery, is now considered behind time if he is not *au fait* in the study of temperature, pulse tracings, antiseptic surgery, aspiration, germ physiology, bloodless surgery, State medicine, and many other new lights of our profession.

We have, as is our wont, given in our present issue merely the pith of the official regulations of colleges and public services, reserving our space for practical advice and information which every student needs, and leaving our readers to obtain for themselves the official regulations in a more reliable form than we can offer it. We conceive it to be our *rôle* to place in the hands of the student and his guardians the semi-confidential details, directions, and hints which college regulations are not intended to communicate, and which are only known to those conversant with the various systems of education, examination, and qualification, and with the ultimate prospects of the student.

PART I.

THE MILITARY AND NAVAL SERVICES.

ARMY.

THE unsatisfactory—we might almost say chaotic—condition of the Army Medical Department, which we were obliged to report in our last Students' Number, is in no respect mitigated since then. We then noted that the Department had been "unified," that is to say, the medical officers who have been hitherto attached to a particular regiment for perhaps their whole service life, are now connected with their own special department, and are liable to be shifted from one regiment to another as the requirements of the Service demand. They are no longer called Assistant-Surgeons, but are named Surgeons; while their superiors, sometimes Surgeons and Inspectors, are now Surgeon-Majors and Surgeon-Generals. The Service is, moreover, no longer a permanent provision, for after ten years' service a Surgeon is liable to get his *congè*, being handed £1,000 "in lieu of all pension and retirement" This bonus of £1,000 depends wholly on his completing his ten years' service. Should he fall sick before that time he will find himself very differently dealt with. It may be believed that these arrangements, so far from allaying the discontent of Army Medical Officers, have aggravated it, and all the objections previously urged against the Service apply with increased force now.

The twelve months which have elapsed since this was written have been occupied by the authorities in an effort to escape the inevitable reform which they know is necessary, but which they cannot bring themselves to grant. Discontent is all but universal within the Service, and unpopularity equally prevalent amongst the outside public. Although the demand for additional Medical Officers is most urgent the War Office has held no examination at

the usual period last August, fearing that there would be no candidates, and that the nakedness of the Service would be exposed. It is now rumoured that sooner than reform the Service and grant the concessions which are necessary to make Army Medical Officers contented, the authorities will abolish the Competitive Examination altogether, and thus throw open the Military Service to the ordinary run of general practitioners—dispensing with the higher education and military training which Medical Cadets have hitherto undergone. In this uncertain state of affairs we advise Students to abstain from the distinction of her Majesty's uniform.

CONDITIONS.

The official regulations may be obtained on application to the Director-General, Army Medical Department, 6 Whitehall Yard, London, S.W.

Examinations are held in February and August, but have ceased to be competitive owing to the dearth of candidates.

The candidate must be under thirty-two years of age, but may be married.

The candidate must make a declaration that he labours under no mental or constitutional disease, nor any imperfection or disability that can interfere with the most efficient discharge of the duties of a medical officer in any climate. His physical fitness will be determined by a board of medical officers, who are required to certify that the candidate's vision is sufficiently good to enable him to perform any surgical operation without the aid of glasses. A moderate degree of myopia would not be considered a disqualification, provided it did not necessitate the use of glasses during the performance of operations, and that no organic disease of the eyes existed.

Having received his diploma in surgery and medicine, both of which are essential to his competition, the student is obliged to apply himself vigorously to the study of certain collateral subjects, which he does usually through the medium of a "grinder." He must perfect himself in chemistry, pathology, and comparative anatomy, and if he can throw a proficiency in botany and natural history, and French and German into the scale, he will materially improve his position in the scale of merit, and establish for himself a character with the authorities for industry and scientific attainments.

The surgeon is subjected to two examinations; one on admission into the service, and a second six months later on leaving Netley.

For the first candidates will be examined in the following, and the highest marks attainable will be distributed as follows:—1. Anatomy and Physiology, 1,000 marks; 2. Surgery, 1,000; 3. Medicine, including Therapeutics, the Diseases of Women and Children, 1,000; 4. Chemistry and Pharmacy, 100. Examinations will also be held in the following voluntary subjects—French and German (150 each) 300 marks; Natural Sciences, 300. The Natural Sciences will include Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany, with special reference to Materia Medica. The number of marks gained in both the voluntary subjects will be added to the total number of marks obtained by those *who shall have been found qualified for admission*, and whose position on the list of successful competitors will thus be improved in proportion to their knowledge of modern languages and natural sciences.

For the first two days of his examination he is employed in penning answers to printed questions; for the third and fourth days he is examined *vivâ voce* on all subjects; and on the fifth and sixth days he is tested by the diagnosis of disease at the bedside in the hospital, by the application of surgical apparatus, and by operations on the dead subject. This trial finished, the successful candidates are selected.

SERVICE ON THE WEST COAST OF AFRICA.

A certain number of candidates, whose answering has been satisfactory, but not sufficiently so to entitle them to a place, were formerly offered appointments on the West Coast of Africa, but recently they have been appointed to the Naval Medical Service, as vacancies on the Coast have not existed for some time. These situations, while they are subject to strong objection on the score of the deleterious nature of the climate, possess some advantages for those whose health can resist its influence. The districts comprised under the West Coast Districts are Sierra Leone, Gambia, and Cape Coast Castle. If the candidate accepts the appointment he is sent out at once, without the period of probation to which others are subjected at Netley Hospital. He is allowed to spend a year at home on full pay, for every year spent in Africa, and the entire period at home and abroad should count as service for pension.

PROBATION AT NETLEY HOSPITAL.

The competitor who obtains a place in the ordinary Service is not allowed to join a regiment at once. He is obliged to undergo a probation of four months at Netley Hospital, near Southampton, where he is compelled to attend the following lectures: Pathology, by Dr. Aitken; Military Surgery, by Dr. Longmore; and Clinical and Military Medicine, by Dr. Maclean; Dr. de Chaumont, Anatomy Hygiene; and Dr. Macdonald, on Naval Hygiene. The lectures on Military Surgery include gun-shot and other wounds; duties of army surgeons in the field, during sieges, on transport, &c., and other special subjects. Those on Military Medicine refer to the tropical and other diseases of the British possessions and colonies, and to the losses by disease. The lectures on Hygiene relate to the examination of water, air, food, clothing, &c. of the soldier, his duties and exercise, and the circumstances affecting his health, meteorology, statistics, and prevention of disease. The lectures on Pathology have reference chiefly to the scientific examination of tropical diseases, and of the other complaints which the army surgeon is especially called on to investigate. The candidates also attend the wards of the hospital under the Professor of Medicine and Surgery, to make themselves acquainted with the system of recruiting, and the modes of keeping the Army Medical Returns. They are also called on to make *post-mortem* examinations, to operate on the dead body, and to pass through laboratory practice on the modes of recognising the qualities and adulterations of food, and on microscopic examination of morbid tissues, and adulterations of food, &c. During his preliminary training here the student is understood to be in Her Majesty's Service; he wears uniform, is under military discipline, and receives pay at the rate of five shillings per day, and two shillings per day for lodging money, if he be not provided with lodgings in the hospital. A sum of money equal to the half-yearly interest on £1,200, the surplus from the "Herbert Memorial," is at the end of each session awarded to the candidate who has the highest number of marks, the fortunate young man who wins this "Blue Ribbon of Netley" being tolerably certain to be well provided for. At the termination of the four months he is again examined in the subjects in which he has been instructed during that period, his marks are added to those obtained by him at the competitive examination, and his position on the list of merit determined by the total. Successful candidates are now eligible to be gazetted to a regiment, or employed on the staff, and enjoy all the rank and honour, pay and privileges, of surgeons, as provided by the regulations.

Thus it will be observed that the first examination simply admits the candidate to the Service, and the conjoint result of it and the Netley examination determines his order of merit.

LIFE AT NETLEY.

The medical candidates, as the surgeons are called until they have passed out of the hospital by their second examination, are congregated at Netley, in addition to the commissioned officers who may be there. During the period of his residence at the Army Medical School each candidate will receive an allowance of 5s. per diem, with quarters, or 7s. per diem without quarters, to cover all cost of maintenance; and he will be required to provide

himself with uniform (viz., the regulation undress uniform of a surgeon, but without the sword). Each candidate has to pay £5 towards the mess fund, one half on his arrival and the remainder when he has passed his second examination. He is then a member of the mess, and entitles to dine at any time during the remainder of his service. The cost of dinner is 2s. 4d. daily, not including wine, and of breakfast from 10d. upwards.

The rates of pay of the officers of the Army Medical Department are as follows :—Daily pay : Surgeon-General £2 to £2 10s., according to length of service ; Deputy Surgeon-General £1 10s. to £1 17s. ; Surgeon-Major, on appointment £1, after five years' service as such £1 5s. ; Surgeon, on appointment £250 a year, after ten years' service 17s. 6d. daily.

The pay of officers shall be issued monthly in arrear.

INDIAN MEDICAL SERVICE.

The regulations, subjects, and times for examination are the same as for the Army Medical Department Passage allowance to India on appointment will be given or a passage provided. When passages are provided on board the Indian troop ships, a charge for messing will be made at the rate laid down in the Royal Passage Warrant of 1865. Pay at 10s. a day will be allowed from date of passing final examination at Army Medical School.

Indian allowance and time of service for pension will reckon from the date of arrival in India.

Surgical instruments are provided in India by the Government for the use of medical officers.

The pay of medical officers in the Indian service is much better than at home, and, if unmarried, the cost of living not greater. Moreover, the medical officer frequently holds lucrative civil medical appointments which afford him a handsome increase of income. Without doubt, to a healthy, temperate, unmarried man the Indian Service is greatly preferable to that at home, but to a delicate person, or one burthened with a wife and children, the advantages are questionable.

For official regulations of the Indian Medical Service apply to the Indian Office, Whitehall, London.S.W.

THE NAVAL MEDICAL SERVICE.

Every candidate desirous of presenting himself for admission to the Naval Medical Service must not be under 21 or over 28 years of age. He must produce some certificate with regard to the date of his birth, and another certificate of moral character, signed by a clergyman, a magistrate or the master of the school where he was educated. He will have to declare that he labours under no metal or bodily disease or weakness, and that he is ready to engage for general service in any climate. His physical fitness will be determined by a Board of Medical Officers, by whom also his vision will be tested. He must be registered under the Medical Act to practise medicine and surgery in Great Britain and Ireland.

Candidates will be examined in the following subjects : Anatomy and Physiology, Surgery, Medicine, including Therapeutics and the Diseases of Women and Children, Chemistry and Pharmacy. The examination in medicine and surgery will be in part practical, and will include operations on the dead body, the application of surgical apparatus, and the examination of medical and surgical patients.

Candidates who desire it will be examined in comparative anatomy, zoology, natural philosophy, physical geography, and botany with special reference to materia medica, also in French and German ; and the number of marks gained in these subjects will be added to the total number of marks obtained in the obligatory part of the examination by candidates who shall have been found qualified for admission, and whose position on the list of successful competitors will thus be improved in proportion to their knowledge of these branches of science.

After passing the above examination, the candidate will be required to attend a course of practical instruction at Netley on Hygiene, Clinical Naval and Military medicine, Clinical Naval and Military Surgery, and Pathology of Diseases and Injuries incident to Naval and Military service. After he has passed an examination on these subjects satisfactorily, he will be eligible for a commission as surgeon. During his residence at Netley he will receive an allowance of 5s. per diem with quarters, or 7s. without quarters, to cover all costs of maintenance ; and he will be required to provide himself with the Regulation undress uniform of a surgeon.

Having passed his examination and served at Netley, he will, in the course of the following day, receive his appointment as acting Surgeon to one of Her Majesty's ships, either for service on board that ship, or for service on shore, at one of the naval hospitals—Haslar or Plymouth. He will at the same time be informed that he is granted two or three weeks', as he may require, leave of absence, to enable him to provide his uniform and appointments. These he can get at any of the naval clothiers.

The expense of a Surgeon's uniform is about £47 5s. The candidate must also provide himself with a set of surgical instruments, which will cost him from ten to fifteen guineas. All kinds of underclothing, towels, handkerchiefs, &c., may be purchased much more advantageously from a regular dealer in those things than from any naval outfitter.

The full and half-pay of Naval Medical Officers is in accordance with the following scale :—

Full-pay : Surgeon—Under five years' service, 11s. ; eight years', 12s. 6d. ; under eleven years' service, 14s. ; under fourteen years' service, provided he passed his examination as Staff Surgeon, 15s. 6d. ; above fourteen years', 17s. ; Staff Surgeon—On promotion, 18s. ; seventeen years', £1 ; and for each additional year of service, 1s. a day more until the maximum is reached—namely, £1 2s. Fleet Surgeon—On promotion, £1 3s., and up to £1 10s. Half-pay Surgeon—Five years', 6s. ; eight years', 8s. ; eleven years', 10s. ; above eleven years' service, provided he passed his examination for Staff Surgeon, 17s. Staff Surgeon—On promotion, 11s. ; seventeen years', 13s. ; above seventeen years', 14s. ; Fleet Surgeon—On promotion, 16s. ; twenty years' service, 16s. 6d. ; and for each additional year of service, 6d. a day more until the maximum is reached—namely, 18s. 6d.

Retirement is provided for according to age and service, under special regulations.

By warrant of February, 1875, it has been enacted—

1. Surgeons on entry have the same relative rank as Paymasters, Chief Engineers, and Naval Instructors—namely, to rank with Lieutenants under eight years' seniority.

2. Staff Surgeons to be denominated "Fleet Surgeons," and Staff Surgeons second-class simply "Staff Surgeons;" the distinction in rank between these two grades to be denoted by a small difference in the uniform.

3. Inspectors-General to be compulsorily retired at the age of sixty ; to be allowed £2 per day, provided they shall have completed the service to entitle them to the maximum half-pay of their rank.

4. Fleet Surgeons and Staff Surgeons same scale of retirement as chaplain and naval instructors, secretaries and paymasters.

5. Fleet Surgeons to have the option of retiring after twenty years' full-pay service in all ranks at 15s. per day, and after 25 years, 21s.

Medical officers share in the proceeds of all *prizes* captured from the enemy, of captures and seizures under the several Acts of Parliament passed relating to the revenues of Customs, and of trade and navigation, for the abolition of the slave trade, for the capture and destruction of pirates and piratical vessels, and of the rewards conferred for the same, as also in the awards of all salvage granted

to the crews of Her Majesty's ships and vessels of war with other officers of corresponding rank.

8. The full and half-pay of Naval Medical Officers is in accordance with the following scale :—

Full-pay : Surgeon—From 11s. (under five years' service) to 17s. a day, above fourteen years' service. Staff Surgeon—On promotion, or under fourteen years' service, 18s., up to 22s. a day. Fleet Surgeon—On promotion, or under twenty years' service, £1 3s. up to 30s. a day. Deputy Inspector-General of Hospitals and Fleets. —On promotion, or under twenty-two years' service, £1 11s. up to 38s. a day. Half-pay : Surgeon—Under five years' service, 6s., and up to 17s. a day after 11 years. Staff-Surgeon—On promotion, or under fourteen years' service, 11s. up to 15s. a day. Fleet Surgeon.— On promotion, or under twenty years' service, 16s. ; until the maximum is reached—namely, 18s. 6d.

THE CIVIL PUBLIC SERVICES.

POOR LAW MEDICAL SERVICE.

A YOUNG qualified practitioner indisposed to be an assistant, and desirous of commencing general practice without investing any money in purchasing a succession, may, perhaps, obtain a Poor-law appointment, though he should scarcely expect to obtain a livelihood from the inadequately remunerated appointment.

ENGLISH POOR-LAW MEDICAL SERVICE.

Prior to the passing of the Metropolitan Poor Act, 1867, the English Poor-law Medical Service may be said to have been in the hands of the guardians, supervised by the Poor-law Board. Each parish in England and Wales has its guardians of the poor, and these parishes are grouped together to form unions. The unions are divided into districts for medical relief. Union medical officers, therefore, have the care of a district, or sometimes the care of the workhouse of the union—sometimes of both. The officer was elected by the guardians, and the appointment confirmed by the Poor-law Board. He was required to have both a medical and surgical qualification. In some instances these were specified, but almost always the *London College of Surgeons* and Apothecaries Hall *were the most favoured* diplomas. But this is not the case now. So long as candidates possess a double qualification, such as that of the L.R.C.P. Lond., and M.R.C.S.Eng., or similar qualifications from Scotland or Ireland, they are quite eligible for these appointments, and have a good chance of obtaining them if their testimonials are good, and they have a few friends on the Board.

The salaries of Poor-law appointments are very low ; in fact, so preposterously inadequate that it would seem as if the medical man were paying the union for the monoply of doctoring its paupers. *£25 a year is a not uncommon salary* for attending and providing physic for a large district, and thus as the medical officer has to provide all the medicines, the poor have often to put up with a very scanty supply. It must, however, be admitted that lately some Boards of Guardians have done much to mitigate this evil by providing, so far as some large towns are concerned, local dispensaries from which the pauper patients are supplied with medicines. By this means not only is the work of the medical officer much lightened, but as he has not to pay for the drugs, his salary is virtually increased. Although this plan is only adopted in London and some of the larger towns, it is to be hoped that it will be extended as far as possible to all rural districts. Where dispensaries cannot be established a fixed sum might be allowed for drugs, for if the medical officer chooses to work for nothing, or next to nothing, it is a great hardship and injustice to his poor patients to make a contract that he should provide everything out of his small salary. Let all drugs be found for him ; to this it must come at last, and the sooner the better.

Usually all capital operations, reduction of dislocations, midwifery, vaccination, &c., are paid for at a separate tariff, though we regret to state that too frequently local boards do their utmost to dispute payment of these fees. But vaccination, which used to be a considerable addition to the salary of the parish doctor, is often given in urban districts to a medical man who is in no way connected with parish work.

The above system differs in many respects from that of Ireland, referred to below. In English districts, moreover, the practitioner derives much of his income from "clubs," and from attendance on small tradesmen, artisans, and tenant-farmers, who would certainly be recipients of gratuitous relief in Ireland ; and, therefore, the parish work of the English provincial doctor is proportionately much lighter than that of his Irish *confrère*. The sanitary duties of the profession in England are also remunerated at a much higher rate, though by no means more onerous than similar duties in Ireland. Parish appointments are, however, sought after by young men as a means of getting into practice, and are often held in country districts solely to prevent fresh opposition being introduced. The Metropolitan Poor-law Act, 1867, assimilates the Poor-law, so far as London is concerned, to that of Ireland, and the Poor-law Board is now merged in the new Local Government Board. It has established in London asylums and dispensaries, and distributed the cost of supporting them over the metropolis. Under the new Public Health Act many Poor-law officers have been also appointed medical officers of health.

THE IRISH POOR-LAW SERVICE.

The newly-qualified medical practitioner who may elect to try his luck in the Irish p,ovinces sets his hopes, in the great majority of instances, upon obtaining one or more Poor-law medical appointments in some district where there is hope of private practice. There 163 workhouses and about 793 dispensary medical officers, besides apothecaries. The number of vacancies that occur annually averages 100. The average salary in this service averages about £103 15s. ; and when it is taken into consideration that in the vast majority of rural districts, it is necessary to keep a horse, and in some a boat as well, the average area being from forty to sixty square mile, it is plain that there will not be a very large margin left from the public emoluments. The medical officer is also *ipso facto* the registrar of births, marriages, and deaths, and the medical officer of health for the district, under the Public Health Act passed in 1873. The former office, in country districts, selnom yields more than £10 a year, and often not half that amount, and the emoluments of the latter appointment in very few cases reach £20, averaging about £12. The medical officer is also vaccinator for the locality, and is required to vaccinate every one who wishes to come. For each patient his fee of 1s. is paid, along with his salary, by the guardians, and the sum total of these fees varies, according to the populousness of the district, from £2 to £50, an average for the provinces beiug about £5. Despite the miserable salary, and the very many discomforts of dispensary life, these appointments are generally eagerly sought for—firstly, because they afford the new comer a certain, though hardly-earned salary, to supplement his private earnings ; and, secondly, because, if not secured by the new comer, they would of necessity bring a competitor for practice into the field, and inasmuch as private income is of far greater import than public earnings, country medical practitioners are obliged to undertake the public duty in order to save themselves the monopoly of their private emoluments.

APPOINTMENT.

The qualifications required by the Poor-law Commissioners are a Licence in Surgery or a Diploma in Medicine, and a Diploma in Midwifery ; the candidate must also be 23 years of age.

The appointment lies with the Dispensary Committee, who elect by vote. As politics and religious feeliug run high in Ireland, these elements enter into the election of Poor-law medical officers. Family interest also possesses great weight.

The candidate will do well to bear these facts in mind, as his personal attendance on the day of election will be required, and whatever other qualification he may have, he will then find that his compatibility in these respects with the majority of the committee is essential; and, accordingly, he had better first make himself acquainted with the local peculiarity, whatever it may be, before he enters on his candidature, otherwise, in all probability, any expenditure that he may make in the matter will be simply thrown away. We may here observe, alao, that in very many instaaces the appointment is virtually made before the anvertisement appears for a medical officer in which case, also, candidates are put to unnecessary trouble and expense under falsc pretences.

CONTROL.

Each district is under the direct control of a committee composed of the neighbouring landholders, the appointment of medical and other officers is made by this committee, and the entire management of the district is under their control. Their acts are, however, subject to the approval of the Local Government Board, who have the power either of interposing their veto on any appointment, or even of expelling an officer by a "sealed order," without trial or accusation, or without the resource of appeal or investigation. The salary is paid by the Board of Guardians, and no increase can be made in the amount without their assent and that of the Local Government Board. Under the late Sanitary Act the committee may recompense the medical officer for specil services, such as those during an epidemic of cholera, or for sanitary reports. The number of unions in Ireland is 163, to each of which is attached a medical officer, who is appointed and controlled by the Board of Guardians in the same manner as the dispensary surgeon is by his committee. The salary is usually better than that of the dispensary doctor, and the duties of a more easy and satisfactory description, inasmuch as the duties are confined to daily attendance at the workhouse hospital, and no night visits out of doors or any long journeys across the country are involved.

DUTIES.

The duty of the dispensary doctor is twofold. He is to attend his dispensary on a given day or days in the week. Frequently there are two dispensaries in the district, separated from each other by several miles, and he will have perhaps to attend two days a week. He has also to visit at any hour of the day or night a sick person for whose relief a visiting-ticket has been issued by a member of the committee or by the relieving officer, and to continue his attendance as often as may be necessary until the termination of the case. Moreover, he has a great many registry books to keep and a multitude of returns to make, and in the majority of districts he has to make up all the medicines for the poor.

The pressure of these duties is in the greatest degree dependant on the goodwill of the members of his committee. If the medical man be a favourite with his masters, they will wive him very little trouble with "scarlet runners," as the visiting-tickets are, from the colour of the paper on which they are printed, humerously called and will be unwilling to trouble him even with cases deserving of personal attendance.

If, on the other hand, it is his misfortunc to come in contact with some of the half-bred committee-men, who know nothing of the treatment fit for an educated gentleman, or cherish a personal spite, the discharge of his duties may become simply unbearable. He may be premptorily summoned, in any weather, at any hour, and to any distance, to a case which he may probably find to be altogether trvivial, or to a person whom he may know to be perfectly well able to pay—aye, even the committee-ma'n own brother or daughter.

SUPERANNUATION.

By a rcenet Act of Parliament a Poor-law medical officer may now receive a pension not exceeding two-thirds of his salary on being incapacitated from illness or old age. This grant is strictly at the discretion of the guardians; nevertheless, it has been given in most cases in which physical incapacity has been clearly proved. It is, however, at best a miserable resource, and can by no means be calculated upon as a provision for old age. There are now 53 ex-medical officers receiving superannuation allowance, whose average term of service before pension was 20 years, and whose average allowance is £64 15s. Their average age at retirement was 63. All official information may be obtained of B. Banks, Esq. Local Government Board, Custom House, Dublin.

Complete information as to fees, emoluments, duties, and appointment of Irish Poor-law medical officers will be found in the "Irish Medical Directory" for 1878.

PART II.

THE EDUCATION AND QUALIFICATION OF THE STUDENT IN THE UNITED KINGDOM.

REGISTRATION.

To the General Medical Council is entrusted the supervision of Medical Education, and it has made a number of recommendations, the majority of which have been accepted by all the Examining Bodies, and are, consequently, found in their regulations. The student has, therefore, nothing to do with the Council, except that he must take care to be duly registered as a Student in Medicine, *at the commencement of his career*, at the offices, 315 Oxford Street, London, or at the offices of the Branch Registrar of the division of the United Kingdom in which he is residing. He must in England previously have passed a preliminary *Arts Examination*. In order to effect this, each student should apply according to a form, accompanied by a certificate, of his having passed such examination, the same to be lodged with the Registrar, who will thereupon enter the name in the Students' Register, and issue a certificate to that effect.

The intention of this registration is to ensure that the student shall occupy four years in medical study, which is, theoretically, the period which must be devoted to his education before his entry to the profession. In England this requirement is set down as essential, and no student can present himself for examination sooner than four full years from the date of registration, but the obligation to occupy this period in medical study is frequently satisfied by a nominal service for the first year under a general practioner, or in a provincial hospital or dispensary, and the actual period of medical study is often really three years. Recently, however, the several qualifying bodies are recommended by the Medical Council not to admit to the final examination for a qualification under the Medical Acts any candidate whose name has not been registered at least forty-five months previously. Besides, the standard of medical education, as well as of the examinations of various examining bodies, is so much higher than it formerly was, while our own knowledge of medicine and the collateral sciences, and the scope of our medical studies, have recently become so enlarged, that four years is by no means too long a period to be devoted to medical study. And even the diligent student will find that at the expiration of this term he will have but an imperfect acquaintance with several branches of his profession.

In Ireland and Scotland the majority of the licensing bodies do not insist on the passing of Arts Examination before registration, nor do they insist on four years' study from any fixed date—a system which is reprehensible on the part of the licensing bodies, highly objectionable in its effect upon medical education, and very injurious to the student. It offers a premium to idle or uneducated students to put off the paltry preliminary examination *de die in diem* until the eve of his medical examination, and it enables the student to receive his diploma within less than three years of study, because the date from which

his commencement is calculated is not fixed. Generally speaking, in Ireland the student's name is forwarded to the Registrar of the Branch Council by the public officer of his school, and therefore he need give himself no trouble about it.

REGISTRATION OF PRACTITIONERS.

All duly-qualified Physicians, Surgeons, Medical Graduates, and Apothecaries are required by the Medical Act 21 and 22 Vic., c. 90, to be registered before they can hold any public medical or surgical appointment, or issue valid medical certificates.

The medical registration of any practitioner may be effected on personal application or in writing (according to a form to be had in London or at either of the Branch Offices). With such application he must produce or transmit the *Diplomas* to be registered, and also pay or remit the fee, which is regulated by the Medical Council—viz., £5 for first registration, and 5s. for every qualification which may be subsequently added. Each practitioner is entitled to receive a copy of the official Medical Register containing the registration free on application.

THE CAREER OF THE ENGLISH MEDICAL STUDENT.

SEVERAL courses are open to the gentleman who has decided to enter the medical profession in England, whether he fulfil his curriculum in London or in the provinces. As the latter course is generally determined by local causes, we will first of all point out a few things that concern both London and provincial medical students.

The Society of Apothecaries, hitherto fettered by Act of Parliament, required an *apprenticeship*. The apprentice was, however, of late years allowed to fulfil part or all of his curriculum during his apprenticeship, and under the Act recently passed it is entirely dispensed with. This system, be it said, when carried out in a liberal manner, was not without its advantages. In the early part of his pupilage the apprentice not only learned practical pharmacy, and became acquainted with the more generally used articles of the materia medica, but was often assisted in preparing for the preliminary examinations. He often, indeed, gained a thorough acquaintance with, and had indelibly impressed upon his memory, the doses of the different drugs used in medicine, the composition of the more important compound preparations, those drugs which are compatible and those which are incompatible with each other, and many other facts in practical pharmacy, of which, under the present system, even otherwise good men often show a lamentable amount of ignorance. Moreover, he prepared himself to take, should he ever wish to do so, the post of assistant to a general practitioner, as the experience he had thus acquired would procure him a situation in preference to prizes, gold medals, and even university distinctions. Again, this experience was of the very highest value on settling in general practice, especially in country practice, where he would, in all probability, be bound to dispense his own medicines.

In place, however, of the old plan of apprenticeship a young man can become the *pupil* of some one in practice. This is frequently done by those who aim at the higher branches of practice. An experienced practitioner, whether a physician or a surgeon, who will superintend or direct a pupil's studies, offers great advantages, and we think that those who can afford a pupilship will not regret the expense of providing themselves with such a guide.

We would remind the student that some *preliminary examination in arts*, which is recognised by the General Medical Council *must* be passed by him *before* entering a hospital. The subjects must include Latin and mathematics. There are numerous preliminary examinations of which a list may be obtained. For the English Medical Student we should say that, *cæteris paribus*, the Matriculation Examination of the London University is the best. We do not deny that it is more severe than most of the other preliminary examinations, but, nevertheless, we would recommend those who have sufficient ability and the time to prepare for it to matriculate, as they will thereby be enabled hereafter, if they should desire so to do, to present themselves for examination for the degrees in Medicine or Surgery conferred by this University. It is also accepted by the College of Surgeons in lieu of the Arts Examination otherwise imposed on candidates for its Fellowship.

Should circumstances deter the student from offering himself for matriculation, he will find an easier standard in one or other of the preliminary examinations for the Fellowship or Membership of the Royal College of Surgeons of England, or the Licence of the Society of Apothecaries. Full information with regard to the dates and subjects of examination, or the list of examinations recognised by these bodies, may be obtained from the Secretary to the College of Surgeons, Lincoln's Inn Fields, or from the Beadle at Apothecaries' Hall, Bridge Street, Blackfriars.

It is to be hoped, however, that the student has not gained a knowledge of classics merely with the view of passing the preliminary examination, or that these studies will not be entirely thrown aside and forgotten directly he has passed this examination. Independently of the mental discipline involved in the pursuit of these studies, the nomenclature adopted in the study of his professional subjects and the etymology of scientific terms, are so generally of Greek or Latin origin, that were it for this reason only, it would be quite worth while for the student to keep up, as far as possible, a knowledge of these languages. At the same time the modern languages must not be forgotten, as a good knowledge of either French or German, especially the latter, will be found of great service to those who wish to enter the higher ranks of the profession, more particularly with respect to any future contributions they may make to medical literature.

A pupil may enter at any of the London hospitals without having passed through either a pupilship or an apprenticeship. Provided he has passed a preliminary examination, he has only to pay his fees and hear the Introductory Lecture on the 1st of October, when he is admitted at once to all the privileges of a medical student. He should decide on the diplomas he requires, and guide his studies accordingly. Most schools have now a composition fee, entitling to all lectures and practice required for the ordinary qualifications in medicine and surgery. They also mostly have another sum, very little higher, entitling the student to *perpetual* attendance on all lectures and hospital practice. It is best to take the perpetual ticket, as all contingencies are thereby provided for. The fees are generally payable in instalments, at the commencement of each winter session. The Dean of any school will always forward details, as well as any special information which a student may need.

The student who comes to London to fulfil his curriculum at a metropolitan school generally requires *lodgings*, unless he can live with relatives or friends, which is of course better. Comfortable furnished apartments are to be had in respectable streets near all the hospitals. Two brothers or two friends can, of course, do this a little less expensively than one. The price varies with the season and the quality of the rooms. It should be mentioned that one or two of the Medical Schools (St. Bartholomew's, University College, King's College), have collegiate institutions in connection with them, where rooms may be had, instead of taking lodgings. At many schools, also, some of the lecturers receive pupils. Special information on this subject may be had on application to the Dean or any of the lecturers.

As to contending for *prizes* there are differences of opinion. Diligent attendance on the classes and in the wards will enable the student to store his mind with knowledge fitting him for his profession, and this should

be his first aim. Gold and silver medals are honourable distinctions, but only secondary ones. Still, we would not discourage those intending to compete. It should be remembered by all students that the true end and aim of their studies should be to make them good physicians or surgeons. They should study diligently to make themselves such, and there can be no reasonable objection to their striving for, in addition, an extra good standard in any subject or subjects in which they feel they are qualified to obtain it. In so far as prizes and scholarships encourage the study of particular branches, there can be no objection to them. Nearly every student excels in some subjects more than others, and a prize is an additional incentive to arduous, but otherwise unrequited, studies. The only danger is that they should become too special, and encourage one branch of study at the expense of the others. Students have often failed at examinations where the number of subjects was numerous through giving undue attention to some favourite branch of study.

Competition for appointments to dresserships and other offices, where much practice is seen, stands on a different footing. No prizes can equal such posts, and the possibility of getting them should influence largely the choice of a school. In some schools they must be paid for. In others the diligent gain them without extra expense. The student having selected his hospital and school, has chosen his teachers. We have only to remind him that, however able they may be, the result depends chiefly on his own application.

CURRICULA AND QUALIFICATIONS.

As to these, the information most valuable to students may be divided into two parts :—

I. The regulations with which they must comply before they can present themselves for examination to any of the licensing bodies.

II. The means that exist to enable them to do so. In the first division are to be placed the regulations of the corporations ; in the second, some account of the many schools of medicine and hospitals where professional education can be pursued. A natural supplement to this information is a brief sketch of the career open to young men after they have obtained their diplomas, especially in the public services.

In accordance with this plan, we proceed to consider—first, the Regulations of the Qualifying Bodies. These may also be divided into two classes—I. The Universities ; II. The Corporations.

THE UNIVERSITIES.

Oxford and Cambridge.

As there are generally few candidates for the degrees of these Universities, we shall make our remarks as brief as possible.

Every student in medicine must pass all the examinations for the degree of B.A., and date the commencement of his medical studies from the final examination for arts. Candidates for the degree of B.M. are required to pass two examinations, embracing the usual subjects. At the second examination he is examined in two of the ancient authors—Hippocrates, Aretæus, Galen, and Celsus—and in some modern authors, as Morgagni, Sydenham, or Boerhaave. He must spend two years in study prior to the first or scientific examination, and two years more after passing the first, prior to the final examination for the same degree. A dissertation has to be publicly read three years after obtaining the M.B., before being eligible for the M.D.

At the University of Cambridge, five years of medical study are required, unless the student has graduated with honours as B.A. For the M.B., he must have resided nine terms in the university, and have graduated in arts. There are three examinations for this degree. The first is in chemistry, physics, and botany ; the second, in anatomy (human and comparative), physiology, and pharmacy ; and the third, in the usual practical subjects. After the third examination an Act has to be kept, which consists in reading an original thesis, followed by an oral examination on the subject of the thesis. The M.D. degree may be taken three years after the M.B. An Act has to be kept, with oral examinations, and an essay has to be written *extempore*. There is also a degree of Master in Surgery, for which the candidate has to attend extra courses of lectures on anatomy and surgery. An examination in so much of State Medicine as is required by medical officers of health, will be held in October, 1878. With respect to Cambridge (and almost the same remarks apply to Oxford), a residence during nine terms—*i.e.*, the greater part of each of three years—is by statute requisite to obtain any degree in arts, medicine, or any other subject. The actual cost of this to a student who keeps his terms by residence in a college is from £150 to £200 a year. This, however, would include all payments to the university and the college—all fees, as well as clothes, pocket money, travelling expenses, &c. But the non-collegiate students have only to pay the university fees, which are very small. They lodge and board as they like, and their expenses, therefore, are entirely in their own hands.

London University.

For those who would not like or cannot afford to enter a college, it is, perhaps, preferable to graduate at the University of London. The medical degrees of this university have now obtained a reputation second to none. No student can therefore propose to himself a higher qualification. The training is rather longer than is required for the diplomas of most corporations. The examinations are very stringent, but in after years the student will feel the gratification of having obtained such a degree. Every student is required to go through the full course of hospital duties *after* he has passed the matriculation examination. It is, therefore, very important that he should matriculate before entering a medical school, otherwise he will be compelled to stay more than four years at an hospital, as the university regulations require four years of hospital study and attendance on lectures *after matriculation*.

The next matriculation exam. will take place on Jan. 13, 1879, and the subjects, on each of which the candidate must show a competent knowledge, are :—Latin, any two of the following languages—Greek, French, German, and either Sanskrit or Arabic ; the English language, English history, modern geography, mathematics, natural philosophy, and chemistry. The Latin subjects for January, 1879 are :—Cæsar, De Bello Gallico, Books iii and iv. For June, 1879—Cicero, De Senectate, and the First Speech against Catiline. The Greek subjects are—Homer, Odyssey, Book xiv. and Xenophon, Anabasis, Book iii, for January and June, 1879, respectively. The candidates who pass this examination are arranged in three divisions, viz., Honours Division, in the order of proficiency—First and Second Divisions, in alphabetical order. The first candidate in the honours division receives an Exhibition of £30 per annum for the next two years ; the second and third candidates, Exhibitions of £20 and £15 respectively ; and the fourth, a Prize to the value of £10, in books, money, &c.

We should also strongly recommend those students who intend to graduate at the London University to so arrange their studies as to pass the preliminary scientific examination *before commencing their regular medical studies*, taking a preliminary year for the purpose of preparation. In this way much knowledge will be gained which will go to clear the way for his first year's studies, which would otherwise be much encumbered.

With regard to the Preliminary Scientific Examination, some fresh regulations came into force during the current year, of which the following are the most important. The Examination commences on the third Monday in July, and no candidate is admitted to it unless he has completed his seventeenth year, and has passed the matriculation examination. The subjects on which he will be exa-

mined, are—Inorganic chemistry, experimental physics, botany, vegetable physiology, and zoology. Candidates who shall pass in all these subjects, and shall also pass at *the same time* in the Pure Mathematics of the First B.Sc Examination, or shall have previously passed the First B.A. Examination, shall be considered as having passed the First B.Sc. Examination. There are in this, as in every other stage of the graduate's career, examinations for honours, which afford the student the opportunity of gaining highly-prized distinctions in various branches, such as valuable scholarships, exhibitions, and prizes. The medical and scientific degrees of the University are—Bachelor and Doctor of Medicine, Bachelor and Master in Surgery, and Bachelor and Doctor of Science

For the regulations respecting these examinations the student should apply to the Registrar of the University. We may, however, remark that certain changes have recently been made in the regulations for the University of London's degrees of Bachelor and Doctor in Science. It has come to be generally felt that scientific knowledge, to be real, must be practical as well as theoretical, and that a thorough knowledge limited to a comparatively small range is preferable to a slighter acquaintance spread over a more extended area. In the first examination for Bachelor of Science, which every candidate will be required to pass, the programmes in mathematics, experimental physics, and inorganic chemistry, have been carefully revised. In place of the superficial acquaintance with both zoology and botany formerly required at this examination, there is a single examination (written and practical) in general biology, in which a more thorough knowledge is required of the simplest forms and elementary phenomena of animal and vegetable life. The regulations for the second B.Sc. examination, on the other hand, are framed with the view of allowing the candidate to bring up any three of the following nine subjects :—(1) Pure mathematics, (2) mixed mathematics, (3) experimental physics, (4) chemistry, (5) botany, including vegetable physiology, (6) zoology, (7) animal physiology, (8) physical geography and geology, (9) logic and psychology. Moreover, in the matricular examination, which forms the basis of the science curriculum, German may now be taken in substitution for Greek. In regard to the Doctor's Degree, a change has been made in favour of candidates who prolong the interval between their first and second examinations for the degrees of Bachelor from one year to two or more, as such will be allowed to come up for the degree of Doctor of Science within a year of their attaining the degree of Bachelor.

A special examination is held once in every year in subjects relating to Public Health, to which those candidates only are admitted who have passed the Second M.B. Examination at least one year previously. Candidates will be examined in chemistry and microscopy, as regards the examination of air, water, and food ; meteorology, geology, physics and sanitary apparatus, vital statistics, hygiene, and sanitary laws, full particulars of which may be obtained from the Registrar.

A new supplemental charter having been granted to the University a few months since, on the joint application of the Senate and of Convocation, empowering the Senate to admit women to graduate in its several faculties (arts, science, law, medicine, and music) on such conditions as the Senate, with the concurrence of the Home Secretary, should deem expedient, the Senate lost no time in passing a resolution which made all the existing regulations, relating, not only to graduation, but also to the various honours and rewards granted at tthe several examinations open to female as well as to male candidates. This resolution having been now approved by the Home Secretary, female candidates will be admitted forthwith to the matriculation examination ; and all such as have already passed the general examination for women will be considered as having matriculated, and will be admissible (after the required interval) to the First Degree Examination in either of the Faculties. Further, with a view to the special encouragement of female candidates desiring to go through a regular academical course, the trustees of the Gilchrist Educational Trust have instituted two Exhibitions, one of £30, the other of £20 per annum, tenable for two years, to the female candidates who pass highest in the Honours Division at the matriculation examination ; and two Exhibitions, one of £40, the other of £30 per annum, tenable for two years, to the female candidates who pass highest at the First B.A. Examination (provided that they obtain in the first case two-thirds, and in the second three-fifths, of the total number of marks), to assist them in pursuing their studies at some collegiate institution approved by the trustees ; with a further reward of a gold medal of the value of £20 (or a book-prize of the same value) to the female candidate who passes highest at the Second B.A. Examination, if she obtains not less than two-thirds of the total number of marks. These rewards are quite independent of those granted by the University, and may be held in conjunction with them. Further particulars may be obtained by application to the Registrar of the University, London, W.

University of Durham.

Two licences and three medical degrees are conferred by this university—viz., Licence in Medicine, Master in Surgery, and Doctor of Medicine engaged in his professional studies four years after registration, and one of those four years must be spent at the University of Durham. The regulations for the licence in Surgery are similar to those for the licence in Medicine.

With regard to the degree of Bachelor of Medicine, no one will be admitted to that degree unless he has kept one year's residence in Arts at the Durham University College of Medicine, and has passed both the final examination for the degree of Bachelor of Arts, or an equivalent to it, and also the examination for the degree of Bachelor of Medicine.

No grace for the degree of Doctor of Medicine will be granted unless the petitioner is a Bachelor of Medicine of the standing of twenty-one terms (seven years) at least from his registration or matriculation, and of three terms at least from his admission to the degree of Bachelor of Medicine, nor unless he has written an essay based on original research or observation on some medical subject selected by himself, and approved of by the Profeseor of Medicine.

There is also an examination and a certificate of Proficiency in Sanitary Science. Hospital practice can be attended at the Newcastle Infirmary, which contains 230 beds. There are four scholarships of £25 a-year, tenable each for four years. Dickinson Memorial Scholarship, £15, tenable for one year, for general proficiency. Tulloch Scholarship, £20, tenable for one year, for Anatomy, Physiology, and Chemistry. Charlton Memorial Scholarship, £35, tenable for one year, for Medicine. Gibb Scholarship in Pathology, £20, tenable for one year. Four Resident Dressers, who also act as Physicians' Clinical Clerks, are chosen every six months from the senior students. Fee for six months' board and residence, £10 10s. Two assistants in the Pathological Department are chosen every six months. At the end of each Session a Silver Medal and Certificate of Honour will be awarded in each of the required classes.

With regard to fees, a composition fee for all the Lectures, payable on entering to the first Winter Session, £52 10s. Separate Courses of Lectures, each £4 4s. Twelve months' hospital practice, £7 7s. ; Six months, £5 5s. ; Three months, £4 4s. ; Perpetual fee, £17 7s. ; or, if paid by instalments, first year, £7 7s. ; second year, £6 6s. ; third year, £5 5s. These fees also are payable in advance.

The Royal College of Physicians of London.

The high position which this venerable College holds among the corporations is too generally acknowledged to require any particular attention being drawn to it. It is gratifying to know that this College has lost none of its prestige by sympathising and becoming more associated

with the general body of practitioners. Its license is an honourable one, and we are surprised that students are not more ambitious than they are to enter the profession through its portals.

The Fellowship.—The Fellowship of the College is attainable only by election, and no one can be proposed who is not a member of at least four years' standing.

The Membership.—A person may become a member of this College without holding a degree in medicine, or, indeed, any diploma. But every candidate who shall have commenced his professional studies after September, 1861, shall satisfy the Censors' Board that previously to the commencement of his professional studies he has obtained a degree in Arts from some university of the United Kingdom, or of the Colonies, or from some other university specially recognised by the Medical Council, or that he has passed examinations equivalent to those required for a degree in Arts. The curriculum extends over five years.

The following additional regulations for the membership came into force on Jan. 30th, 1878:—1. Any candidate who shall produce satisfactory evidence of having passed an examination on Chemistry and Materia Medica, required for a degree in medicine at a university in the United Kingdom, in India, or in a British colony, will be exempted from re-examination on those subjects. 2. Any candidate who has already obtained the degree of Doctor or Bachelor of Medicine at a university in the United Kingdom, in India, or in a British colony, or who shall have obtained a qualification entitling him to practise Medicine or Surgery in the country where such qualification has been conferred, wherein the courses of study and the examinations to be undergone previously to graduation shall have been adjudged by the Censors' Board to be satisfactory, shall be exempt (if the censors shall think fit) from all or any parts of the examinations hereinbefore described, except such as relate to the Third or Pass Examination.

Graduates in Medicine of any British university are admitted to an examination for the Membership. Such graduates are exempt from some parts of the examination —*e.g.*, anatomy and physiology. Even graduates of accredited foreign universities have no difficulty in being admitted to examination. All persons who have been admitted before February 16, 1859, licentiates of the College, and also all extra-licentiates who are not engaged in the practice of pharmacy, may be proposed to be admitted a Member of the College. Every candidate for the membership is expected to pass an examination, but there are certain cases, referred to under sections 15, 16, and 17 of the bye-laws of the College, in which the candidate is exempted from some portion of the examination.

The Licence.—The Licence of this College is a qualification to practise medicine, surgery, and midwifery, and is recognised by the Poor-law Board as a qualification in surgery as well as in medicine, but unless a graduate of some university, he is forbidden to use the title of doctor, but we regret to say many do so. It was regarded at first as a diploma for the general practitioner, intended to supersede that of the Apothecaries' Company. The examination is conducted by specially-appointed examiners, and is complete in the several departments. There are two examinations for the Licence, the *first* of which may be passed after the termination of the second winter session, while the *second* examination cannot be passed until after four years of professional study. The fee for the College licence is fifteen guineas, of which five are to be paid on admission to the first examination.

Every candidate for the College Licence will be required to produce satisfactory evidence of having completed the course of study in accordance with the by-laws and regulations of the College, which may be obtained of the Registrar, and to pass the professional examinations conducted by the Examining Board.

Any candidate who shall produce satisfactory evidence of having passed an examination on Chemistry and Materia Medica, required for a degree in Medicine at a university in the United Kingdom, in India, or in a British colony, will be exempted from re-examination on those subjects. Any candidate who shall have obtained a qualification which entitles him to practise Medicine or Surgery in the country where such qualification has been conferred, after a course of study and an examination equivalent to those required by the regulations of the College, shall, on production of satisfactory evidence as to age, moral character, and proficiency in vaccination, be admissible to the Pass Examination, and shall be exempt from re-examination on such subjects as shall in each case be considered by the Censors' Board as unnecessary.

Royal College of Surgeons of England.

No College has exercised more influence over the profession than this. Without the M.R.C.S. it is not easy to obtain any English surgical appointment. Its membership, although no longer essential, yet carries great weight in a parish appointment. For this reason most English students take this diploma, which, together with a medical qualification, suffices for every purpose of the general practitioner. The College gives four diplomas—the Membership, Fellowship, a diploma in Dental Surgery, and one in Midwifery, which last is, however, mostly confined to those who are already members.

THE MEMBERSHIP.—This diploma gives no vote in the affairs of the college. It is only a licence to practise, and corresponds with the licentiateship of the Edinburgh and Dublin Colleges.

In future, candidates for the diploma will be examined in the Practice of *Medicine*, although there are certain conditions on which he can claim exemption. He must also have passed the preliminary examination of the College, or one that is recognised by the College. There are now two professional examinations for the Membership, the Primary and the Pass.

THE FELLOWSHIP.—Members of long standing are often admitted to the Fellowship by election. As, however, this grade is obtainable by examination, is of greater value, and needs no personal influence, men who have sufficient time and ability prefer the F.R.C.S. after exam.

For the Fellowship he must be a Member of the College of eight years' standing, and is admitted to examination on producing a certificate signed by three Fellows to the effect that he has been engaged in the Practice of Surgery for eight years, and is a fit and proper person to be admitted as a Fellow.

Few consulting surgeons in England are without the Fellowship, and in most of the London hospitals appointments are unattainable without it.

Apothecaries' Society of London.

The Licence of the Society of Apothecaries is perhaps the most useful medical diploma for the general practitioner in England. The monopoly enjoyed by this body for many years, in this respect, is not easily to be disturbed. The laws of many institutions require their medical officers to hold this diploma, and these laws are not readily altered. Though other medical qualifications are recognised by the Poor-law Board, there is no doubt that the guardians throughout the country—and they elect the medical officers—are familiar with the diploma of the Apothecaries' Society, and it is to them more of a guarantee than other qualifications of which they are ignorant. Everyone, therefore, intending to settle in *England* as a general practitioner—even if he take other diplomas—would probably consult his own interest by taking up the L.S.A.; and as the fee is only six guineas, a very large number of young men will, no doubt, secure this avenue to appointments.

THE LONDON HOSPITALS AND MEDICAL SCHOOLS.

Of all the hospitals in London, that of St. Bartholomew's is the largest and most ancient. It was founded in the year 1123 by Rayhere, minstrel of Henry I., in connection with his foundation of the Church and Priory of St. Bartholomew, and it was designed for the reception of sick paupers, for lying-in women, and for the children of the latter, up to seven years of age. In 1724 a building was provided for a Museum of Anatomical and Chirurgical preparations; and in 1734 leave was granted for any of the surgeons "to read lectures in Anatomy in the dissecting room of the hospital." From that period up to the present time new wards have been opened, the old theatres and museums enlarged, or new ones erected, libraries and laboratories founded, dissecting rooms rebuilt, until it now forms one of the largest hospitals and best schools in the metropolis. Attached to this hospital are a college for resident pupils, a Convalescent Home at Highgate, and an Institution for the training of Nurses.

The Clinical Practice of the Hospital now comprises a service of 710 beds: of these 227 are alloted to the medical cases, 322 to the surgical cases, 26 to diseases of the eye, 20 to the diseases of women, and 81 to the syphilitic; while 34 are at the Convalescent Hospital at Highgate. Children are admitted into both the medical and surgical wards, those under five years of age being received into the female wards.

From St. Bartholomew's we pass on to Guy's Hospital, which was the first of the London Hospitals designed and built for the special purposes it fulfils. It was founded in 1724 by Thomas Guy, a wealthy bookseller and stationer, who had previously built and furnished three wards in St. Thomas's Hospital for the reception of 24 patients. Since then the original building has been gradually enlarged, until it now contains 695 beds, and includes wards for obstetric, ophthalmic, and other special departments. It has also a fine museum of anatomy, pathology, and comparative anatomy, which contains 1,100 specimens, 4,500 drawings, an unique collection of anatomical models, and a series of 600 models of skin diseases. As the hospital is situated close to the London Bridge Railways, there are great facilities for getting to any part of London or the country, so that the student can reside a little distance out of town, and thus enjoy the benefit of country air.

The magnificent building, or rather series of buildings, now known as St. Thomas's Hospital, is situated at the foot of Westminster Bridge, on the south bank of the Thames, facing the Houses of Parliament. From its proximity to some of the largest factories in London, it affords scope for surgical practice from accidents second to none, whilst amongst the members of its staff are names of European reputation in medicine and science. The original hospital, or old St. Thomas's, was situated near London Bridge, in close proximity to that of Guy's, and was founded as far back as 1215, by Peter de la Roche, Bishop of Winchester, who denominated his foundation, "The Spitil of St. Thomas, the martyr of Canterbury," in honour of Thomas à Becket. In 1862, however, the property on which the old hospital stood was sold for the extension of the railway accommodation, and the establishment temporarily removed until the present buildings were completed in 1871. The original hospital contained 500 beds, while the present one contains in all 572 beds. It consists of six blocks appropriated to the reception of patients, with one for the administrative and other offices, and one for the medical school.

Another of our largest hospitals is the London Hospital, the establishment of which dates from the year 1740, when a few benevolent persons opened a small infirmary in Featherstone Street. The Medical College of the London Hospital has been greatly enlarged of late, and with its splendid hospital presents as fine a field for practical study, especially for surgery, as any in the metropolis. The government of this college has been re-constituted, every department supervised, and a secretary appointed to ensure proper discipline, and promote the general improvement. There are now a large number of scholarships and prizes of considerable value, but more important still to studious men, all the numerous appointments in the wards are open to pupils without extra payment, and the value of the dresserships, clerkships, house-surgeoncies, house-physiciances, and other residential positions in a hospital of the first magnitude, are always considerably enhanced where the staff take such interest in the development of its educational resources as at the London. The hospital contains 800 beds.

To pass from the large to the smaller hospitals, Westminster Hospital first opened its doors in 1715 at a small house in Birdcage Walk, under the name of the "Publick Infirmary for the Sick and Needy." The celebrated Mead was one of its first physicians, and Cheselden, the teacher of John Hunter, was also one of its surgeons. The school attached to this Hospital is small, but its situation is very convenient, near the Abbey and the Houses of Parliament. Lodgings are also very reasonable in the neighbourhood, and the school is one of the most moderate in respect to fees. The hospital contains 191 beds.

With regard to the other hospitals, our remarks may, in an historical point of view, be more brief, as some of them are of comparatively recent origin. Few colleges in London have of late years been so successful as the North London or University College and Hospital, both in its annually increasing number of students and in the number of those who subsequently pass their several colleges on first presentation. The College, which is situated in Gower Street, about 100 yards from the hospital, gives instruction in every department of science, and specially prepares students for degrees in all the faculties at the University of London.

Among the hospitals which afford great advantages from their situation, is that of Charing Cross. It is in the very centre of London, where there is constant communication with every part. During the past year some very extensive alterations have been undertaken, which have rendered this hospital and its medical school worthy its splendid position, and given it a claim to be reckoned amongst the most important of the metropolis. Since the opening of the new wards nearly 200 beds are placed at the disposal of the staff for clinical teaching. In connection with it the practice of the Royal Westminster Ophthalmic Hospital, close by, containing 50 beds, is open to matriculated students, and affords an excellent opportunity for the study of that branch of the profession.

If Charing Cross Hospital is remarkable for its good central position, St. George's Hospital has a position which is unrivalled, as respects its salubrity and the architectural attractions of the surrounding neighbourhood. The hospital contains 353 beds, of which 205 are devoted to the reception of surgical, and 148 to medical, cases.

Among the hospitals and schools more recently established, St. Mary's Hospital and Medical School occupies a prominent position. It is located, together with the medical school, at Paddington, in close proximity to the Great Western Railway Terminus. Many of the pupils take advantage of the railway, and reside some few miles in the country, coming to town daily to attend the hospital practice and lectures. Students with slender purses will find the neighbourhood of the hospital a moderate one as regards lodgings, and easy of access by omnibus and the Underground Railway from all parts of London. Lastly, and by no means least in reputation, there are the Middlesex and King's College Hospitals. The former is very conveniently situated in the West-end of London, and can accommodate 300 patients. There is a special department for cancer cases, affording accommodation for 33 in-patients, whose period of residence in the hospital is unlimited. Wards are also appropriated for the reception of cases of uterine disease and of syphilis, and beds are set apart for patients suffering from diseases of the eye. King's College is close to Somerset House, in the Strand, having a frontage

on the new Thames Embankment, within a few minutes' walk of several railway stations. Its Hospital, which is situated within two or three minutes' walk, contains 205 beds. Here for many years Dr. Todd, among its physicians, and Sir William Fergusson among its surgeons, gave it a reputation which, judging from its present staff of medical officers, it will not easily lose.

APPOINTMENTS, PRIZES, NEW SCALE OF FEES, &c.

ST. BARTHOLOMEW'S HOSPITAL.—*Appointments:* Four House-Physicians and four House-Surgeons are appointed annually without fee; each is provided with rooms, and receives a salary of £25. A Resident Midwifery Assistant and an Ophthalmic House-Surgeon are appointed every six months; they are provided with rooms, and receive a salary of £25 per year; the Assistant-Chloroformist, salary £25 and rooms; In-patient Clinical Clerks; Clerks and Dressers to the Assistant-Physicians, and Assistant-Surgeons.

Scholarships, &c.—There are two open Scholarships in Science, value £100, tenable for one year; Jeaffreson Exhibition, value £20, tenable for two years; Preliminary Scientific Exhibition, value £50, tenable for one year; three Junior Scholarships, of £50, £30, and £20 respectively; Treasurer's Prize for Practical Anatomy; Foster Prize for Practical Anatomy; Senior Scholarship, value £50, for Anatomy, Physiology, and Chemistry; Wix Prize; Hichens Prize; Lawrence Scholarship and Gold Medal, value 40 guineas, for Medicine, Surgery, and Midwifery; two Brackenbury Scholarships in Medicine and Surgery; Bentley Prize, for reports of Surgical cases; the Kirkes Gold Medal for Clinical Medicine.

Scale of Fees.—Fee for perpetual attendance on lectures and hospital practice, 132 guineas, payable in the following instalments:—First winter, 40 guineas; first summer, 46 guineas; second winter, 46 guineas; or a single payment of 125 guineas. Fee for general subjects for Students of Dental Surgery:—First winter, 31½ guineas; first summer, 31½ guineas; or a single payment of 63 guineas.

GUY'S HOSPITAL.—*Appointments:* The House-Surgeons and House-Physicians, the Obstetric Residents, Clinical Assistants and Dressers, are selected from the Students, according to merit, and without payment. There are also a large number of Junior Appointments, every part of the Hospital Practice being systematically employed for instruction.

Scholarships, &c.—Open Scholarship, of One Hundred and Twenty-five Guineas, in Classics, Mathematics, and Modern Languages. Open Scholarship, of One Hundred and Twenty-five Guineas, in Chemistry, Physics, Botany, and Zoology. Six Scholarships, varying in value from £10 to £50 each, for general proficiency in medical study. The Joseph Hoare Prizes; the Treasurer's Gold Medal in Medicine; the Treasurer's Gold Medal in Surgery; the Gurney Hoare Prize of £25, for Clinical Study; the Sands Cox Scholarship of £15 per annum for three years, for Physiology and Physics; the Michael Harris Prize of £10, for Anatomy.

Scale of Fees.—For the entire course of Lectures and Hospital Practice, 125 guineas if paid in one sum on entrance, or by two equal instalments of £66, payable at the commencement of the first winter, and of the following summer session; or payment may be made by instalments of £50, £50, and £37 10s., payable at the beginning of the first, second, and third years respectively. Fee for the Dental Course, 63 guineas, or in two annual instalments of 40 guineas and 23 guineas.

ST. THOMAS'S HOSPITAL.—*Appointments:* Two House-Physicians, two House-Surgeons, a Resident Accoucheur, two Assistant House-Physicians, and two Assistant House-Surgeons, holding office for three or six months. The Assistants are non-resident, but the other officers are provided with rooms and commons in the Hospital free of expense. An Ophthalmic Clinical Assistant, with salary of £50; Surgical Ward Clerks, Clinical Clerks and Dressers to In-patients and Patients, Obstetric Clerks, two Hospital Registrars, each with a salary of £100; Assistants in the Dissecting Room, Prosectors, Pathological Assistants, and Assistants in the Physiological Laboratory.

Scholarships, &c.—Two Entrance Scholarships in Natural Science of £60 and £40 respectively; for first year's students, the William Tite Scholarship of £30, and five College Prizes ranging in value from £5 to £20; for second year's students, the Musgrove Scholarship of £42, and five College Prizes ranging in value from £5 to £20; for third year's students, three College Prizes of £20, £15, and £10 respectively. In addition there are awarded the Cheselden Medal for surgery, the Mead Medal for medicine, the Solly Medal for reports of surgical cases, the Grainger Testimonial Prize of £20 for a physiological essay, and the Treasurer's Gold Medal for general proficiency.

Scale of Fees.—For the entire course of Hospital Practice and Lectures, £125, paid on entrance; or £130 in two payments, £70 on entrance, and £60 at the beginning of the next year; or by three instalments, of £60, £50, and £30, at the beginning of the first, second, and third years respectively. The fee for the attendance on the *general* subjects required of students in Dental Surgery is for the two years £55, or by instalments: £50 for the first year, and £10 for the second year.

LONDON HOSPITAL.—*Appointments:* The resident and other Hospital Appointments are free to full Students. The Resident Appointments consist of five House-Physiciancies, four House-Surgeoncies, and one Accoucheurship; also two Dresserships and two Maternity Assistantships.

Scholarships, &c.—Two Entrance Science Scholarships, value £60 and £40, and two Buxton Scholarships, value £30 and £20, will be offered for competition at the end of September to new Students. Entries on or before September 20th. A Scholarship, value £20, in Human Anatomy, to first years' Students; a Scholarship, value £25, in Anatomy, Physiology, and Chemistry, to second year's Students; a Scholarship, value £20, in Clinical Medicine; a Scholarship, value £20, in Clinical Surgery; a Scholarship, value £20, in Clinical Obstetrics; the Duckworth Nelson Prize, value £10 (biennial), in Clinical Medicine and Surgery. Prizes, value £60, to Dressers of out-patients, in Minor Surgery.

Scale of Fees.—Perpetual Fee for Lectures and Hospital Practice, and two years' Practical Anatomy, payable in three instalments of 40, 35, and 25 guineas, at the commencement of the 1st, 2nd, and 3rd years respectively, 100 or if in one payment 90 guineas. Composition fee for Students entering at or before the beginning of their second Winter Session, their first year having been spent elsewhere, payable in two instalments of 40 and 35 guineas, 75 guineas; or if in one payment, 70 guineas. Perpetual fee for lectures alone, 50 guineas; perpetual fee for Hospital Practice alone, 50 guineas; Dental Students (General Hospital Practice and Lectures), 40 guineas; perpetual fee for Dental Practice, 10 guineas.

ST. GEORGE'S HOSPITAL.—*Appointments:* House-Physicians and House-Surgeons are elected half-yearly from among the perpetual pupils. They are entitled to hold their appointments for twelve months and to board and reside in the Hospital, free of all expense; Assistant House-Physician; Assistant House-Surgeon; Obstetric Assistant, with a yearly salary of £100, and board and residence in the Hospital; Pathological Curator, with a salary of £50; Microscopical Pathologist, with a salary of £25; Medical and Surgical Registrars, each with a salary of £50 per annum; Assistant Medical Registrars; Assistant Surgical Registrars; Ophthalmic Registrar; Ophthalmic Assistant; Demonstrator of Anatomy, with a salary of £50; Senior Assistant-Demonstrator, with a salary of £20.

Exhibitions, &c.—The William Brown Exhibitions: one of £100 per annum, tenable for two years, and open to perpetual pupils possessing a registrable diploma; and one of £40 per annum, tenable for three years, and open to students in their third year. The Brackenbury Prizes: one each in Medicine and Surgery. The Clarke Good Conduct Prize, the Thompson Medal, the Brodie Clinical Prize in Surgery, the Acland Clinical Prize in Medicine, the Johnson Memorial Prize in Anatomy, the Treasurer's Prize, and three General Proficiency Prizes of ten guineas each.

Scale of Fees.—Composition fee for perpetual pupils, £125, or in the following instalments: first year £45, second year £45, third year £40. For attendance on the hospital practice and lectures required by the examining Corporations, £45 for the first year, £45 for the second year, and £20 for each succeeding year. The latter scale of payment does not entitle the pupil to become house-physician or house-surgeon, or to compete for the William Brown Exhibitions. The fee for general subjects in Dental Surgery is £55, payable in two instalments, first year £30, second year £25.

UNIVERSITY COLLEGE HOSPITAL.—*Appointments:* Six Physicians' Assistants, Six House-Surgeons, and Four Ob-

stetric Assistants, are selected annually by examination from among the senior Students without additional Fee. They reside in the Hospital, paying only for their board, and have charge of the resident patients in the absence of the Physicians and Surgeons. The offices of Physicians' Clerks, Surgeons' Dressers, Surgical Ward Clerks, and Ophthalmic Surgeons' Assistants are selected from among the Pupils who are also Students of the College, without additional Fee.

Scholarships, Etc.—Three Entrance Exhibitions of £30, £20, and £10 respectively, tenable for two years; Atkinson-Morley Surgical Scholarship of £45 a year, tenable for three years; Atchison Scholarship, value about £55, tenable for two years; Sharpey Physiological Scholarship, value about £70 a-year, tenable for three years; Filliter Exhibition for proficiency in Pathological Anatomy, value £30; Dr. Fellowes' Clinical Medals; the Liston Gold Medal; Alexander Bruce Gold Medal; Cluff Memorial Prize; Class Medals, &c.; Gold and Silver Medals, or other Prizes, as well as Certificates of Honour, are awarded, after competitive examinations in particular branches of study. Prizes to the value of £10 will be given in the Class of Hygiene.

Scale of Fees.—125 guineas, if paid in one sum at the commencement of the Course, or 130 guineas if paid by instalments, as follows: first year 60 guineas, second year 50 guineas, third year 20 guineas. Hospital Practice and Clinical Instruction, perpetual, £36 15s.; one year £15 15s.; six months, £10 10s. Practical Pharmacy, three months, £5 5s.

KING'S COLLEGE HOSPITAL.—*Appointments:* One Physician's Assistant, two House-Surgeons, and one Physician-Accoucheur's Assistant, appointed every six months. They are supplied with board and residence in the Hospital on payment of £30 each. Assistant House-Physician, Assistant House-Surgeon, and Assistant Resident Accoucheur, appointed every six months; In-patient Clinical Clerks and Dressers; Out-patient Clerks and Dressers; Obstetric Clerks, Ophthalmic, Dental, and Aural Assistants; Post-mortem Clerks; Assistant Demonstrators and Prosectors of Anatomy.

Scholarships, &c.—Three Warneford Scholarships, each of the value of £25 per annum, two tenable for three years, and one tenable for two years; one Warneford Scholarship of £25 per annum, tenable for two years, open to resident students; three Junior Scholarships of £20 each, tenable for one year, and open to students of the first year; one Second Year Scholarship of £30 tenable for one year, and open to students of the second and third years; the Senior Scholarship of £40, tenable for two years, and open to students of the third and fourth years; Daniell Scholarship of £20 per annum, tenable for two years, for work in the Chemical Laboratory; two Sambrooke Registrarships, each of £50 per annum; one Science Exhibition of £100; two Warneford Prizes of £25 and £15 respectively; Leathes Prize; Todd Medical Clinical Prize: Jelf Medal; Tanner Prize of £10 for Obstetrics. Class Prizes, each of the value of £3, are awarded annually in particular subjects.

Scale of Fees.—Payment for the entire course of Hospital Practice and College Lectures may be made in one sum, viz., £125 on entrance, or by the following instalments:—£60 on entrance, £50 at the beginning of the second winter session, and £25 at the beginning of the third winter session. Fees for the Dental Course, £95 1s. 6d.

ST. MARY'S HOSPITAL.—*Appointments:* There are four Resident Medical Officers, three of whom are appointed for twelve months, and one, the Obstetric Officer, for six months; all of them live, free of every expense, in the Hospital. Two Prosectors, appointed annually; a Demonstrator of Anatomy, a Medical Tutor, and a Resident Registrar, each with a salary of £100 a-year, appointed annually, and eligible for re-election. Clinical Clerks and Dressers.

Scholarships, &c.—Two Scholarships in Natural Science, tenable for three years; an Exhibition in Natural Science of £20, tenable for one year; a Scholarship in Anatomy of £20, tenable for one year; a Scholarship in Pathological Anatomy of £40, tenable for one year. At the end of each session prizes ranging in value from £2 2s. to £4 4s. are given for proficiency in particular subjects.

Scale of Fees.—For unlimited attendance on Lectures and Hospital Practice, 125 guineas if paid by instalments, or 119 guineas if paid in one sum. Fee for Hospital Practice and Lectures required by the Examining Bodies, 107 guineas in instalments, or 101 guineas in one sum. Fee for Dental Students, 62½ guineas.

WESTMINSTER HOSPITAL.—*Appointments*: There are nume- Dresserships and Clerkships; the posts of Medical and Surgical Registrar, each with £40 a year, and of House-Physician, House-Surgeon, Resident Obstetric Assistant, Assistant House-Surgeon, Physician's Assistant, Surgeon's Assistant, Ophthalmic Assistant, and Assistant in the Skin Department.

Scholarships, &c.—Entrance Scholarships next October.—The Fence, £50 a year for two years, and two others value £50 and £20. Subjects—Latin, Mathematics, French or German, and Chemistry and Natural Philosophy. The Latin books the same as the June Examination of the University of London Matriculation—Ovid: Epistola ex Ponto. Book II. There are also—an Exhibition, value £10 10s., for first year's men; a Scholarship in Anatomy and Physiology, value £21, for second year's men; Prizes for Clinical Medicine and Surgery of £5 each; the Frederic Bird Medal and Prize, value £15; the Chadwick Prize for General Proficiency, value £21.

Scale of Fees.—In one payment, £92 10s.; in two payments of £49 each, payable on entrance and at commencement of second year respectively; by payments distributed over five sessions, amounting to £107 2s. There are no extras, except parts for dissection. Fees for shorter periods or for single courses may be learned on application to the Dean. Fees for Dental Students, payable in one sum on entrance, £45.

CHARING CROSS HOSPITAL.—*Appointments:* Medical and Surgical Registrars, each with a salary of £40 a year; Resident Medical Officer, Assistant Medical Officer, Resident Surgical Officer, Assistant Surgical Officer, Resident Obstetrical Officer, Assistant Demonstrator, Pathological Assistant, Clinical Clerks, and Dressers. The Resident Officers are provided with rooms and commons, and the Assistant Officers with commons, in the Hospital.

Scholarships, &c.—Two Entrance Scholarships of £30 and £20 respectively, tenable for one year; the Llewellyn Scholarship of £25, open to all matriculated students who have completed their second year; the Golding Scholarship of £15, open to matriculated students who have completed their first year; the Pereira Prize of £5; the Governor's Clinical Gold Medal. Silver and Bronze Medals and Certificates of Honour are awarded to the most deserving candidates in the various classes.

Scale of Fees.—Composition fee for matriculated students, £81 7s., payable in five instalments, or first year's fees, £38 17s.; second year's fees, £36 15s.; third year's fees, £10 10s. Composition fee for the course of Dental Surgery, £42 2s.

MIDDLESEX HOSPITAL.—*Appointments:* Two House Surgeons, three Resident Physician's Assistants, Resident Obstetric Physician's Assistant. The above officers have residence and board in the Hospital free of expense, but they pay on appointment fees varying according to circumstances from 10 to 30 guineas.

Scholarships, &c.—Two Broderip Scholarships of £30 and £20 per annum respectively, tenable for two years, for Medicine and Surgery; two Entrance Scholarships of £25 and £20 per annum respectively, tenable for two years; John Murray Medal and Scholarship, awarded every third year; the Governor's Prize of £21; Clinical Prize of £10 10s.; Class Prizes in particular subjects.

Scale of Fees.—General fee for the entire course of Hospital Practice and Lectures, £90, if paid in one sum on entrance, or by instalments of £35, £35, and £20, payable at the commencement of the first, second, and third years respectively, and £10 for every additional year's attendance. Course of Dental Surgery, £42, payable in two instalments of £26 5s. and £15 15s.

SPECIAL SCHOOLS.

LONDON SCHOOL OF MEDICINE FOR WOMEN.

This school was opened three years ago at Henrietta Street, Brunswick Square, for the purpose of giving to women the advantages of a complete course of medical education. The institution has met with unexpected success, and it is supported by a large and influential section of the community. The winter session of 1878-79 will commence on October 1, and will comprise classes in Anatomy, Physiology, Practice of Medicine, and Practice of Surgery, and Practical Anatomy with Demonstrations. Clinical instruction will be given at the Royal Free Hospital, and will include lectures on Clinical Medicine, Clinical Surgery, and Hospital Attendance.

Dressers, Clinical Clerks, and a Pathological Registrar will

be selected from among the senior students. Fees for ordinary curriculum of non-clinical lectures, £80, or £40 the first year, £30 the second year, and £15 the third. Fees for clinical instruction and lectures for four years, £45, or £20 the first year, £15 the second, and £15 the third, the fourth being free. Apply for information to the Dean, or to the Hon. Sec., Mrs. Thorne, at the School, 30 Henrietta Street, Brunswick Square, W. C.

LONDON SCHOOL OF DENTAL SURGERY.

This institution is situated in Leicester Square. The meetings of the Odontological Society are also held here. In winter, lectures are delivered on Mechanical Dentistry by Mr. J. S. Turner, on Wednesdays, at 7 p.m.; on Metallurgy in Dentistry, by Mr. G. H. Makins, on Tuesdays and Fridays, at 6.30 p.m. In summer Mr. S. H. Cartwright lectures on Dental Surgery and Pathology, and Mr. C. S. Tomes on Dental Anatomy and Physiology. General fee for special lectures required for the curriculum, £15 15s. The Saunders Scholarship of £20 per annum, and prizes, are open for competition. In connection with the above is the

DENTAL HOSPITAL OF LONDON.—Surgeons: Messrs. Fox, Medwin, Gregson, Coleman, Harding, and Hill. Assistant-Surgeons: Messrs. Moon, Hepburn, Gibbings, Woodhouse, and Hutchinson. Dental House Surgeon; Mr. M. L. Read. Assistant-Dental House-Surgeon: Mr. Fothergill. Fee for two years' hospital practice, £15 15s.

NATIONAL DENTAL COLLEGE.

This is quite a modern institution, having been open less than eighteen months. In connection with it is the National Dental Hospital, situate in Great Portland Street, which was established in 1861. The teaching at this school is recognised by the Royal College of Surgeons for the dental diploma, and lectures and demonstrations are given similar to those at the London School of Dental Surgery in Leicester Square. The following are the lecturers with their subjects:—Dental Anatomy and Physiology: Mr. Thomas Gaddes. Dental Surgery and Pathology: Mr. Oakley Coles. Dental Mechanics: Mr. G. Williams. Dental Metallurgy: Mr. Alfred Tribe. Supplemental Lectures.—Dental Materia Medica: Mr. James Stocken. Elements of Histology: Mr. Thomas Gaddes. Demonstrations on Dental Mechanics: Mr. Harry Rose. Deformities of the Mouth: Mr. Oakley Coles. The Session commences on October 1st.

SCHOOL OF PHARMACY OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

Lectures are delivered on Monday, Tuesday, and Wednesday mornings at 9 o'clock. The course consists of sixty lectures. Two courses are given annually, the first commencing on October 7th, and the second course on March 3rd, 1879. The subjects of these lectures are—(1) Physics in relation to Chemistry and Pharmacy. (2) Inorganic Chemistry. (3) Organic Chemistry, Botany, and Materia Medica. These lectures are delivered on Thursday, Friday, and Saturday mornings at nine o'clock. The first course commences on October 4th; the second course on March 6th, 1879. The laboratories are open from ten o'clock in the morning until five in the afternoon daily, except on Saturdays, when they are closed at two o'clock. Fees for ten months, according to hours of attendance, twelve to twenty-five guineas; for shorter terms in proportion. Each student is expected to attend every lecture of the course for which he has entered, or to state the cause of absence to the professor or to an assistant.

SOUTH LONDON SCHOOL OF PHARMACY.

This school, which has accommodation for 120 students, is situated at Kennington Cross, and is decidedly the most popular institution for the study of Practical Pharmacy and Chemistry in London. Instruction is also given in Analytical Chemistry for the purpose of qualifying gentlemen in search of appointments under the Public Health and Adulteration of Food Acts, by the Principal, Dr. Muter. Lectures are delivered daily in the laboratory, and each student is required to practically illustrate that he grasps the subject taught as the lecturer proceeds. The winter session commences a fortnight earlier than the medical schools.

SCHOOL OF HOMŒOPATHY.

Homœopathy has now a recognised teaching school for students, which is situate in Great Ormond Street, where lectures and instructions according to homœopathic principles are given by duly qualified members of the medical profession, and where students who believe in the *similia similibus curantur* theory can be taught according to their bent. The winter session at this school opens on October 2nd.

SCHOOL OF MEDICINE.

which is situate at 104 Stamford Street, Blackfriars. This school was opened some few years since for private tuition, and instruction in Medicine, Surgery, and Science, to supplement that provided at the hospitals. The course of study embraces all the subjects of the Medical Curriculum, from the Preliminary Examinations to the final ordeal for a diploma. It also includes preparation for Matriculation, and for the various examinations in science at the universities. A class for bandaging and use of surgical appliances is also held, at which practical demonstrations are given.

SCHOOL OF ANATOMY AND PHYSIOLOGY.

This, like the School of Medicine in Stamford Street, is also established for private tuition, and is situate close to University College, at 16 Woburn Place, its principal being Mr. Thomas Cook, Senior Assistant-Surgeon to the Westminster Hospital, assisted by Demonstrators. The whole of the anatomy (on the dissected body), of physiology (with microscopical preparations and such experiments as the law permits), and operative surgery (on the dead body), are gone through carefully every three months. Fees: Three Months, 3 guineas; Six Months, 4 guineas; for the Higher Examinations, with *special* supplementary class, 5 guineas.

NOTE.—*Where fuller information is required by the reader than that contained in the foregoing notes, it will generally be found on reference to our advertising columns, where also will be found the names of the staffs, lecturers, etc.*

HOURS OF THE INTRODUCTORY LECTURES

To be delivered on Tuesday, Oct. 1, at the different Metropolitan Schools.

St. Bartholomew's Hospital—None.
Charing-Cross Hospital—Dr. J. P. Irvine—4 p.m.
St. George's Hospital—Dr. Whipham—4 p.m.
Guy's Hospital—Conversazione—8½ p.m.
King's College Hospital—Prof. Garrod—4 p.m.
London Hospital—Conversazione—8 p.m.
St. Mary's Hospital—Dr. Farquharson—3 p.m.
Middlesex Hospital—Dr. A. W. Edis—3 p.m.
St. Thomas's Hospital—Mr. Nettleship—4 p.m.
University College—Prof. Lankester—8 p.m.
Westminster Hospital—Mr. Macnamara.—3 p.m.

THE PRINCIPAL METROPOLITAN HOSPITALS TO WHICH NO MEDICAL SCHOOL IS ATTACHED.

Open to Students from the Larger Hospitals.

BETHLEM HOSPITAL.—This Hospital is open for the admission of two resident medical students, who have recently obtained their diplomas to practice Medicine and Surgery, for the acquisition of knowledge regarding the Insane. The next election takes place on the 14th of October, at Bridewell Hospital, and the elected candidates will be expected to commence residence on the 1st of November.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park.—This is a large and important hospital at the East End, containing 164 beds. Consulting Physicians: Drs T. B. Peacock, J. Risdon Bennett, E. Lloyd Birkett. Consulting Surgeon: Mr John Hilton, F.R.S. Physicians: Drs S. H. Ward, J. Andrew, J. C. Thorowgood, Shepherd. Assistant Physicians: Drs Eustace Smith, J. B. Berkart, S. West, and Fothergill.

EAST LONDON HOSPITAL FOR CHILDREN.—Physicians: Drs Eustace Smith, and Horatio B. Donkin. Assistant Physicians: Drs Warner and Crocker. Surgeons: Messrs A. Cæsar, H. A. Reeves. Assistant Surgeon: Mr R. W. Parker. House Surgeons: Messrs Spooner and J. Cæsar. Secretary: Mr Ashton Warner.

GREAT NORTHERN HOSPITAL, Caledonian Road.—Physicians: Drs Leared, Cholmeley, Crucknell, Cooke, Bridges. Obstetric Physician: Dr Gustavus C. P. Murray. Consulting Surgeon: Mr F. Le Gros Clark, F.R.S. Surgeons, Messrs. Gay, W. Adams, T. Carr Jackson, W. Spencer Watson, W. H. Cripps, and J. Macready. Ophthalmic Surgeon: Mr J. Tweedy. Aural Surgeon: Mr A. E. Cumberbatch. Dental Surgeon: Mr C. J. Fox. Chloroformist: Mr Eastes. House Surgeon: Mr T. H. Gillam.

Hospital for Consumption and Diseases of the Chest, Brompton.—This is the largest institution for the treatment of affections of the chest in the United Kingdom, and contains 257 beds. Consulting Physicians: Drs C. J. B. Williams, W. H. Walshe, and R. Quain. Consulting Surgeons: Prof. John Marshall, F.R.S. Physicians: Drs J. E. Pollock, E. S. Thompson, C. T. Williams, R. D. Powell, and J. Tatham. Assistant Physicians: Drs R. Thompson, Burney Yeo, F. Roberts, T. H. Green, and J. M. Bruce. Dental Surgeon: Mr W. P. Bartlett. Resident Medical Officer: Dr W. T. Law. Secretary: Mr H. Dobbin. Three clinical assistants reside in the hospital for a period of six months. Pupils are admitted to the practice of the hospital. Terms, £3 3s. for three months; perpetual £5 5s.

British Lying-in Hospital, Endell Street, St. Giles's, W.C.—Consulting Physician: Dr Priestley. Consulting Surgeon: T. Spencer Wells, F.R.C.S. Physicians: Drs Heywood Smith, Arthur Edis, and S. Fancourt Barnes. This institution receives women only, as midwifery pupils. The fee for the course of three months is £10 10s. Pupils who prove themselves competent receives a certificate signed by the physicians, enabling them to practise midwifery.

West London Hospital.—A well appointed hospital at the western extremity of the metropolis in the Hammersmith Road containing 60 beds. Consulting Physician: Dr Maudsley Consulting Physician-Accoucheur: Dr W. O. Priestley. Consulting Surgeons: Messrs. S. A. Lane and William Bird. ns: Drs Goddard Rogers and Thorowgood. Physician for Diseases of Women: Dr Wiltshire. Surgeons: Messrs W. F. Teevan and Alfred Cooper. Ophthalmic Surgeon: Mr B. J. Vernon. Junior Physicians: Drs Fish, Fothergill, Dr. Vincent Harris. Junior Surgeons: Messrs H. T. Butlin and Keetley. Surgeon-Dentist: Vacant. Resident Medical Officers: Two House-Surgeons and an Apothecary. Gentlemen desirous of acting as clinical clerks or dressers can obtain all information by application to Mr. T. Alexander, at the hospital. The practice of this hospital is open to all students and practitioners.

Hospital for Diseases of the Throat and Chest, Golden Square, W.; contains 21 beds, outposts, Newington-butts, Walworth, and St. John's Gardens, Notting Hill.—Physician: Drs Morell Mackenzie, Robert H. Semple, Prosser James, W. MacNeill Whistler, Felix Semon. Surgeons: Messrs E. Woakes, W. R. H. Stewart. The practice of the hospital is open to students on payment; fee for three months' course, three guineas; for six months, five guineas; perpetual course, ten guineas. Laryngoscopic demonstrations are given daily at half-past two.

Hospital for Sick Children, Great Ormond Street, Queen's Square, W.C., and Cromwell House, Highgate.—Physicians: Drs Dickenson Gee, and W. B. Cheadle. Assistant-Physicians: Drs R. J. Lee, O. Sturges, Thomas Barlow, and Robert Bridges. Surgeons: Mr T. Smith, Mr F. Howard March, Mr Edward Owen, and Mr J. H. Morgan. Surgeon-Dentist: Mr A. Cartwright. Fee for three months' attendance, £3 3s.; perpetual, £5 5s. Secretary: S. Whitford. There are now 104 beds in the hospital, Great Ormond Street, and 52 beds at the country branch; total, 156. The practice at the hospital has recently been thrown open gratuitously to the pupils of the different hospitals and medical schools of London on conditions which may be ascertained of the Secretary.

Central London Throat Hospital, Gray's Inn Road.—The new building, in its incomplete state, contains but 10 beds, but provision is made for 40. The staff consists of Mr Carr Jackson, Consulting Surgeon, and Messrs Lennox Browne and Llewelyn Thomas, Surgeons. Six clinical assistants, being either qualified practitioners or students of three years' standing, are elected to assist the surgeons. There are no fees.

Royal London Ophthalmic Hospital, Bloomfield Street, Moorfields, is the largest of its class in the metropolis, and contains 70 beds. Consulting Physician: Dr F. J. Farre. Consulting Surgeons: Messrs J. Dixon, G. Critchett, and W. Bandman, F.R.S. Surgeons: Messrs Wordsworth, Streatfield, Hulke, Lawson, Hutchinson, Cooper, and J. Soelberg Wells. Assistant Surgeons: W. Tay, J. E. Adams, J. Tweedy. House Surgeons: Messrs Gunn and Burnham. Number of patients annually, about 20,000.

Royal Free Hospital, Gray's Inn Road.—This hospital contains 102 beds. Of the smaller metropolitan hospitals few offer a more extensive field for students in medicine and surgery. An arrangement has been made by which medical students from the School of Medicine for Women are enabled to attend their hospital courses at this institution. Physicians: Drs O'Connell and Cockle. Surgeons: Messrs F. Gant and Rose. Secretary: Mr. J. S. Blyth, from whom full particulars of the dresserships and clerkships may be obtained.

The Temperance Hospital.—The character of this institution is fully described by its title, and the non-alcoholic treatment is carried out in its entirety by an efficient staff. It is situated close to University College in Gower Street.

Royal Orthopædic Hospital, 315 Oxford Street.—Surgeons: Mr B. E. Brodhurst, Mr H. A. Reeves, Mr Chas. Read, Mr Wm. E. Balkwill. House Surgeon: Mr H. F. Baker. Operations on Mondays at 2 p.m. Pupils are admitted to witness the practice of the hospital on payment of certain fees.

Royal Westminster Ophthalmic Hospital, King William Street, Charing Cross.—The hospital contains 50 beds. The practice of the hospital is open to students. Fees for six months, £3 3s.; perpetual, £5 5s. Students of the hospital are eligible for the post of house-surgeon.

Seamen's Hospital (late *Dreadnought*), Greenwich.—For the reception of Seamen of all nations who are received at all hours. Apartments are provided in the house of the surgeon for students and others who may be desirous of studying diseases incidental to tropical climates before entering the services or going abroad. Honorary Consulting Physicians: Drs George Budd and Stephen H. Ward. Visiting Physicians: Dr Charles Henry Ralfe and Mr Harry Leach. Honorary Consulting Surgeon: Mr Geo. Busk. Visiting Surgeon: Mr. N. Davies-Colley. Surgeon: Mr W. Johnson Smith. House-Physician: Dr de Fonmartin. House-Surgeon: Mr P. Dunn. Secretary: Mr Henry C. Burdett.

London Fever Hospital, Islington.—260 beds. Consulting Surgeon: Mr W. S. Savory. Consulting Physicians: Drs Tweedie and Murchison. Physicians: Drs Broadbent and Cayley. Resident Medical Officer: Mr S. F. Murphy.

Royal Hospital for Diseases of the Chest, City Road, E.C.—This hospital treats nearly 6,000 out-patients annually, and makes up 26 beds. A new wing, of which the foundation stone was laid by Princess Louise, will raise the number of beds to over 60. Consulting Physicians: Drs Herbert Davies and Horace Dobell. Physicians: Drs G. Goddard Rogers, P. J. Hensley, Gilbert Smith, and D. W. Finlay. Assistant-Physicians: Drs R. Wharry and W. Murrell. Consulting Surgeon: Mr. G. W. Callender. Surgeon: Mr W. J. Walsham. House-Physician: Dr. Bland. This hospital has just been enlarged by the addition of a very complete new out-patients' department, and wards for 14 additional in-patients.

The Samaritan Free Hospital for Women and Children, Lower Seymour Street.—Physicians—C. H. F. Routh, W. R. Rogers, W. H. Day, Wynn Williams, P. Boulton, and F. H. Champneys. Surgeons: G. C. Bantock, J. K. Thornton, A. H. G. Doran, and W. A. Meredith.

St. Peter's Hospital for Stone and Urinary Diseases, 54 Berners Street, Oxford Street.—Surgeons: Walter J. Coulson, W. F. Teevan. Assistant-Surgeon: F. R. Heycock. Medical men and students are admitted to the practice of the hospital gratis. It contains 16 beds, and 138 in-patients were treated during the past year. The number of out-patients was 13,058, of whom 1,696 were new cases.

The Hospital for Women, Soho Square, W.—Physicians: Protheroe Smith, Heywood Smith, C. H. Carter. Surgeon: H. A. Reeves. Assistant-Physicians: Æ. Munro, R. T. Smith, E. Holland. The hospital contains 61 beds. Clinical instruction is regularly given in the wards, and in the out-patient room daily at 10.30. Clinical clerks and assistants are appointed from time to time, application to be made to the physicians. Students received after the third year.

ENGLISH PROVINCIAL MEDICAL SCHOOLS.

Birmingham: Queen's College.—Students are admitted—(1) as matriculated students who enter for their entire medical education; (2) as occasional students for one or more courses of lectures; (3) as junior students, to prepare for the preliminary examinations of the licensing boards.

Scholarships, Prizes, &c.—The Sands Cox Prize, value £20. Open to students who have completed their curriculum. Subjects: Medicine, Surgery, and Midwifery. Next

examination in the third week of March, 1879. The Warden's Prize, value £5 5s., for first year's students, for general proficiency. The Percy Prize, value £5 5s., for German. Two Ingleby Scholarships, awarded annually for Obstetrical Medicine and Surgery.

Fees.—College fees for all lectures amount to 60 guineas, payable by two equal instalments.

Hospital practice is obtained at the General and Queen's Hospitals, which have been amalgamated for the purpose of clinical instruction under the direction of the Birmingham Clinical Board, by whose order all schedules are signed and all examinations conducted. The hospitals have a total of upwards of 400 beds, and the staff attached is of a very high order.

All students will be required to attend six months alternately at each hospitul, as directed by the Clinical Board, excepting students who enter the hospital for six months only.

Clinical Prizes.—The following prizes are given annually :—Senior Medical Prize for third and fourth year's students, First Prize, £5 5s. ; Second Prize, £3 3s. ; Senior Surgical Prize, for third and fourth year's students, First Prize, £5 5s. ; Second Prize, £3 3s. ; Junior Medical Prize, for second year's students, First Prize, £3 3s. ; Second Prize, £2 2s. ; Junior Surgical Prize, for second year's students, First Prize, £3 3s. ; Second Prize, £2 2s. ; Midwifery Prize, £4 4s. The examinations for all the appointments and prizes are conducted by the Clinical Board, and are open for competition to all students registered by the Clinical Board.

Fees for attendance for four years on the medical and surgical practice, and on the clinical lectures at both hospitals, £42.

Bristol School of Medicine (University College).—Attached to this school, where there is ample provision for education and practice, are two well-appointed hospitals, the Royal Infirmary, containing 242 beds, and the General Hospital, with 154 beds. Competitive examinations are held amongst students of the first, second, and third years respectively, and prizes of money, instruments, and books are awarded annually. The certificates of this school are accepted by all the examining boards. The general perpetual fee is 63 guineas. Medical and surgical hospital practice and clinical lectures are attended at the Royal Infirmary or at the General Hospital, at which institutions additional prizes and scholarships are annually offered for competition amongst the students. Arrangements are in progress for the establishment in Bristol of a College of Science and Literature, of which the existing medical school will form a department.

Leeds School of Medicine.—Clinical lectures are given by the physicians and surgeons attached to the General Infirmary. Ophthalmoscopic demonstrations and demonstrations of skin diseases are given in the Infirmary by the Surgeons in each department, where also are obtainable six clinical clerkships and eight dresserships. Besides the Infirmary, there is a large Dispensary and a Fever hospital, both of which are open to students of the School. Students at this School have excellent opportunities of acquiring a thorough insight of psychological medicine, as the renowned West Riding Lunatic Asylum is in connection, and Dr. Major lectures on Mental Diseases. The systematic lectures are given at the School, and the clinical lectures at the Asylum, which now accommodates 1,500 patients.

There is the Hardwicke Scholarship in Clinical Medicine, value £10, the Thorp Scholarship in Forensic Medicine, value £10 ; three Surgeons' Clinical Prizes, of £8, £5, and £3 respectively. Silver and Bronze Medals, Books, and Certificates of Honour are awarded for proficiency in particular subjects.

The composition fee, for attendance upon all the required courses of School Lectures is £50 8s., to be paid on entrance ; or £26 5s. on entrance, and a second sum of £26 5s. twelve months afterwards.

At the Leeds General Infirmary the perpetual fee for Medical Practice and Clinical Lectures is £26 5s. The same amount is charged for the perpetual attendance on the Surgical Practice and Clinical Lectures. These fees are not included in the composition fee for lectures, and are payable separately.

Liverpool Royal Infirmary School of Medicine.—The Royal Infirmary attached to this School, which contains 300 beds with 40 special wards, for the treatment of diseases of women, is perhaps second to none in England in its general appointments and the facilities it offers to students for gaining practical knowledge.

A payment of 50 guineas on entrance, or in two equal instalments (one-half on entrance, and the remainder within twelve months), entitles the student to attendance on all the necessary Lectures and Demonstrations. The Royal Infirmary contains nearly 300 beds. There are special wards for the treatment of uterine and other diseases of women. During the year 1877, 2,397 patients were admitted into the Infirmary, the daily average number in the house being 247. There were 257 deaths, giving a mortality of 10·7. The number of out-patients was 5,216. The Lock Hospital adjoining the Infirmary contains 60 beds ; during the past year 326 males and 141 females were admitted as in-patients, the daily average number in the house being 37.

Two House-Physicianships and three House-Surgeonships, tenable for six months, and open to pupils of the school who have obtained a legal qualification ; Clinical Clerks and Dressers ; Post-mortem Clerks.

Two Roger Lyon Jones Scholarships, each of £21, for two years, one awarded as an Entrance Scholarship, and the other being open to students who have completed their second year ; the Torr Gold Medal for Anatomy and Physiology ; the Bligh Gold Medal for Anatomy and Physiology. School Medals and Certificates of Honour are awarded for proficiency in certain groups of subjects.

The fee for a perpetual ticket for Hospital Practice is £33 12s., and may be paid in two equal instalments (one-half on entrance, and the remainder within twelve months.)

Manchester : Owens College School of Medicine.—This school, as most of our readers are aware, has resulted from the amalgamation of the Manchester Royal Infirmary School of Medicine with the Owens College, and occupies in the provinces a somewhat similar position to that of University College and Hospital in London. It has a Faculty of Science as well as of Medicine, with departments of Laws and Arts. Since the amalgamation a new Medical School has been built, on the most approved principles, at the western extremity of the College estate. On the ground floor are two large lecture theatres, a library, and a museum. Over the lecture theatres is a dissecting-room, and over the library a physiological laboratory. The course of instruction afforded to students is thoroughly complete. Three of the most important chairs, those of anatomy, physiology, and chemistry, are held by professors who entirely devote their time to the work of instruction. Students wishing to engage in physiological or pathological researches will find opportunities for study in the complete and well-furnished physiological laboratory. Two valuable physiological scholarships are placed for competition in this branch as an incentive to original research.

The Scholarships, Etc., are :—Turner Scholarships of £20, for third year students, and of £15 and £10 for second and first year students respectively ; two Platt Physiological Scholarships of £50 a-year, for two years, for the best original investigation in Physiology ; Platt Exhibitions (two) of the value of £20 each, for first and second year students in Physiology ; Dunville Surgical Prize of £20, for proficiency in Clinical Surgery ; three Gilchrist Scholarships of £50 each, tenable for three years.

Composition fee for the four years' course of lectures, £63, if paid in one sum, or two instalments of £31 10s. each, payable at the commencement of the first and second winter sessions, respectively.

Newcastle-on-Tyne College of Medicine.—This School is a department of the University of Durham, and contains ample provision for acquiring a sound education and practical experience at the bedside. It is smaller than some of the provincial schools, but with some parents and students this would be considered an advantage.

Hospital practice is obtained at the Newcastle Infirmary, which has 230 beds, and in which the required clinical lectures are delivered.

Scholarships and Medals.—Four Scholarships of £25 a year, tenable each for four years. Dickenson Memorial Scholarship, £15, tenable for one year, for general proficiency. Tulloch Scholarship, £20, tenable for one year, for Anatomy, Physiology, and Chemistry. Charlton Memorial Scholarship, £35, tenable for one year, for Medicine. Gibb Scholarship in Pathological Anatomy, interest of £500, tenable for one year. Four resident dressers, who also act as physicians' clinical clerks, are chosen every six months

from the senior students. Two assistants in the Pathological Department are chosen every six months.

Fee for hospital practice and clinical lectures, twelve months, £7 7s.; six months, £5 5s. Composition fee, £17 17s., or if paid by instalments, first year, £7 7s.; second year, £6 6s.; third year, £5 5s. Composition fee to all the lectures, 50 guineas.

Sheffield School of Medicine.—Students at this College obtain excellent instruction in medical and surgical practice at the General Infirmary, which contains 200 beds, and is provided with a museum and pathological and post-mortem theatres. The fees for perpetual attendance are £15 15s. for medical and £21 for surgical practice; for twelve months' medical and surgical practice. each £10 10s.; and for six months £6 6s. each. There is also the Sheffield Hospital and Dispensary, containing 104 beds, and is recognised by the College of Surgeons and the Hospital for Diseases of Women, to which students are admitted. The perpetual fee for attendance on all the lectures required by the Royal College of Surgeons and the Apothecaries' Hall, £42. Prizes to the value of £30 and certificates of honour are given annually. Some of the lecturers, and other local members of the profession, receive house pupils, which will be found far preferable to life in ordinary lodgings.

Liverpool Royal Southern Hospital.—This Institution is one of the largest in the English provinces, and contains 200 beds. It has no school proper, although it contains accommodation for resident pupils, and clinical lectures are delivered daily by members of the staff. These, together with the practice obtained here, which is of a very varied and valuable character, is recognised by all the Examining Boards. Inclusive fees—perpetual, 25 guineas; one year, 10 guineas; six months, 7 guineas; three months, 4 guineas. Students can enter to the medical or surgical practice separately on payment of half the above fees.

Note.—*Our advertising columns, of which an index will be found at the end of the editorial matter, will supply further information, with the names of staff, etc., attached to the foregoing schools.*

HOURS OF THE INTRODUCTORY LECTURES

To be delivered at the different Provincial Schools.

University of Durham—Oct. 1st, 2 p.m.—Mr. McBean.
Birmingham, Queen's College—Oct. 1st, 3.30 p.m.—Prof. Wm. Thomas.
Bristol, University College—None—Session commences Oct. 1st.
Leeds School of Medicine—Oct. 2nd—Dr. Eddison, President.
Liverpool Royal Infirmary School—None—Session commences Oct. 1st.
Sheffield School of Medicine—Oct. 1st, 4 p.m.—Dr. W. Dyson.

MEDICAL EDUCATION IN IRELAND.

THE CAREER OF THE IRISH STUDENT.

The practice of the profession in Ireland, though not nearly as remunerative as in England, still affords a certain prospect to any medical man who is content with modest independence. Irish medical men pride themselves on holding a higher social position than the English general medical practitioner. They are entitled to meet the gentlemen of their locality on terms of equality, and it is not necessary or usual for them to endanger their prestige by the adoption of the trading or Christmas-bill system which obtains elsewhere. In fact, what they lose in income they gain in rank.

In order to put the career of the Irish student as plainly as possible, we narrate his progress from the day on which he takes his first step towards medicine to the hour of his issue from the cocoon of his studentship a fully-developed surgeon.

His parents and guardians have, after much discussion, decided that he shall be a doctor. He has had a moderate amount of schooling, at least the very moderate amount which is essential for the medical preliminary examination, and his father is ready to expend about £130 on his medical education, that sum being divided over four years, or paid down in order to secure the advantage of a considerable saving.

THE CHOICE OF UNIVERSITIES AND COLLEGES

Will depend on various circumstances, and on the aspirations of the student. If he is intended to make a fortune and enlighten his generation as a metropolitan practitioner, and if money and education are plenty, he will probably take Dublin University degrees in arts and in his profession. If the attainment of good professional rank on moderate terms be desired, the Licenses of the Colleges of Surgeons and of Physicians will serve every purpose. For any University degrees which are of any value, it is to be remembered the student must undertake the prolonged study of classics and science in addition to his medical, surgical, and anatomical studies; and he will have to pay a considerable sum for this course of teaching. But if he is content to face the expense and labour, he will enter the profession with all the prestige of an educated gentleman. In fact, the question whether he will or will not lay out for himself a University graduation in arts and medicine, depends principally on whether he has money and time to give to it, and whether or not he means to practise in the metropolis. The Queen's University places at the disposal of the student a cheap University degree, and thereby attracts many applicants, who are at liberty to write M.D. after their names, and are only called upon for a low curriculum, and a nominal residence in the Queen's Colleges. This degree serves as a legal qualification to practise, and passes for an academic Doctorate in Medicine amongst the uninitiated; but it does not confer the prestige attached to the degrees of Oxford, Cambridge, or Dublin, and will not suffice, in this sense, for metropolitan consultation practice.

The Colleges of Surgeons and Physicians in Ireland confer qualifications which may stand well beside any in the United Kingdom, and as they make no pretence of academic training, and do not require either residence or anything more than a single arts examination, they continue to be licensing bodies for the rank and file of the profession in Ireland. If a student contemplates provincial practice—the army or navy—or a dispensary, he will most probably take the usual licences from the two Colleges. If he contemplates the lowly function of a country apothecary, he may take the licence of the Dublin Apothecaries' Hall, which is *in law* equivalent to a medical degree; or the licence of the Irish Pharmaceutical Society, which is now *the* qualification for pharmacy in Ireland, but does not confer the right to practice medicine. If he hopes, while practising as an Apothecary, to achieve a considerable private practice, he will find it necessary to obtain other collegiate medical and surgical degrees.

THE CHOICE OF SCHOOLS.

It must not be supposed that a student who intends taking a degree or diploma in any college need take his lectures in the school attached to that college, if there be one. On the contrary, with few exceptions, all certificates of attendance on lectures are interchangeable, and a student, no matter what medical school he may have studied in, will be admitted to any university or college. To this rule there is an exception. The Queen's University insists on certain courses being attended in one of the Queen's Colleges, by which means it enforces a brief residence in the Colleges.

The choice of a school, hospital, or college having been made, the tyro is perhaps sent to these to pass his

PRELIMINARY EXAMINATION

in general education, but if he is either lazy or ignorant, he may adjourn that unpleasant process, *de die in diem*, until the eve of his final qualification as a surgeon, when, if he does so, he will find himself in possession of a mental muddle of Latin and physic. The preliminary examination is, however, not to be feared.

We strenuously advise the parents of the student to insist on his passing his preliminary education before he enters a medical school or hospital, and thus the student will relieve his mind of the apprehension of a future examination, which he will assuredly put off to the last moment if he can. In England the four years of medical study required to pass do not commence to count until the preliminary is passed. It should be so in Ireland, but is not.

The preliminary examination (of the subject of which details will be found in the official regulations of each college) having been passed or postponed, he comes to town to do work.

COST OF EDUCATION.

Should the student proceed on his account, the lectures necessary for the L.R.C.S.I. will amount to £65; hospital attendance, according to the new scale of fees, £36; lying-in-hospital from £4 4s. to £7 7s. These, with the diploma

fee of £26 5s., represent the essentials. The sum of £50, paid down at the commencement is taken by the College of Surgeons as payment in full for all lectures requisite. The system of perpetual pupilage and discount of fees at hospitals has been abolished within the past month. Thus the absolute payment will amount to somewhere about £93, taking the minimum mode of payment. In addition to this sum are to be considered the payments for "grinding" or "coaching." as the Londoners call it, a process almost universal, but by no means necessary to any industriously inclined student. The fixed sum is at present for private teaching, £15 15s. for the surgical and medical qualifications, and £5 5s. for pharmacy, &c. Should the candidate "grind" for the army and navy examinations, a fee varying from £10 10s. to £21 is, we believe, usual. Should the candidate perform operations on the subject as a practice, they will cost something extra. So that, assuming the extras or voluntary costs are incurred, the total will vary, say from £120 to £140 on a moderate scale; it is, of course, to be expected that pupil holders should have some extra payment; we therefore might name for them 160 guineas.

PAYMENT OF FEES.

If the student becomes an apprentice, he need not trouble himself about his payments. If he is his own manager, he must enter his name with the secretaries of the school and hospital, and pay for the lectures and hospital he intends to take out. If he is wise he will not adjourn the majority of his lectures, as he may, to the next year, but will take in his first year a full third of his curriculum. He is *supposed* to pay the professor's fee or hospital fee in full on entering his name, but few students do so; and many, we are sorry to say, are in the habit of entering for the minimum allowable number of lectures, and paying the minimum allowable proportion of the fee, putting off the attendance perhaps for ever, certainly until the last moment, and adjourning the payment until it becomes necessary to take up the certificates.

By a most objectionable laxity of system a student may get credit for one of his four years of attendance by paying a couple of guineas for dissections, and he may think himself safe in doing so if money be scarce; but if he does not pay his full third or fourth of the fees each year it often happens that he has to put off his examination from year to year—perhaps for ever—for want of the money to pay the accumulated fees of previous years.

The entry of names and commencement of study is supposed to date from the 1st of October in each year, but really does date from the 1st of November, and may be delayed by the dilatory until the 25th of the same month.

The student then begins work, attending hospital each morning at nine o'clock, and occupying his day from half-past eleven to five between lectures and dissections. His holidays—if the term be not ignoble—are a fortnight at Christmas, and a week at Easter, and he finally returns home at the end of July.

ATTENDANCE ON LECTURES.

The average Dublin student is supposed to attend of necessity, and irrespective of voluntary courses, twelve courses of lectures, six of them extending over six months, and six over three months, making a total of 52 months lecturing. In addition to this he is presumed to dissect and hear demonstrations, say an hour-and-a-half daily, for eighteen months, to attend hospital, for at least a couple of hours daily for twenty-seven months. To serve in the chemical laboratory for three months, and in the majority of cases to attend the "grind" for at least eighteen months for two more daily hours. He cannot, if moderately industrious, get on with less than two hours reading per day, and he may have during the same period to work up his business for the "Preliminary," or his Arts Course in the University. This curriculum—taking the lectures on an average of four days weekly—represents nearly five thousand hours close work to be got through in three working years of about seven months (allowance being made for Christmas and Easter and summer holidays),

Thus it will appear that the student, to fulfil the nominal requirements of his education in Dublin, must work very nearly nine hours daily—*i.e.*, from after breakfast to about seven p.m. It is hardly necessary for us to say that even the most avaricious medical bookworm does not attempt such a task. Necessarily the attendance on many of the courses of lectures is nominal in amount. The University of Dublin insists on an attendance of three-fourths of the number of the required lectures, but other Licensing bodies accept as "diligent" attendance the presence of the student at all—a few—or none of the lectures which the student pays for. It would be manifestly ridiculous for them to demand *bonâ fide* compliance with the regulations, and thus it happens that the student being hopeless of attending at—often attends—scarcely any of the lectures which are supposed to form the chief part of his education. The average student thinks himself exemplary if he works his hospital, dissections, demonstrations, physiology, lectures, and grind, and drops in occasionally to the other courses.

The progress of each year is the same, except that he usually devotes more attention to "grinding," dissection, and hospital dresserships, and less to lectures in his later years of study. At the end of his second year he will take his "first half" examination, and by so doing relieve himself, in a great measure, of the study of anatomy, and be in the position of devoting his third year to surgery and medicine. After the expiration of his third session, his student life, whether it begin in laziness and end in hurry and incompetency, or whether it commence in diligence and end in the confidence of proficiency, ends with the last examination, and he goes forth into the world either an ignoramus or a reliable surgeon, whichever his choice may have been.

REGULATIONS AND BYE-LAWS OF LICENSING BODIES IN IRELAND.

UNIVERSITY OF DUBLIN.

(*For Names of Professors and Examiners see Advertisement.*)

THE Board of Trinity College, acting under the advice of their distinguished Medical Registrar, Prof. Haughton, has steadily pursued a course which has raised the medical degrees of the University of Dublin to the highest rank—we might almost say—amongst the licensing authorities of the three kingdoms, and which merits the warm acknowledgments of all friends of priority of medical education.

REGULATIONS OF THE SCHOOL OF PHYSIC.

Matriculation.

Every student must be matriculated by the senior lecturer, for which a fee of five shillings is payable; but he need not attend any of the Arts Courses unless he desire to obtain a Licence or Degree in Medicine or Surgery. No student can be admitted for the Winter Courses after the 25th November.

QUALIFICATIONS FOR DEGREES AND LICENSES.

Bachelor of Medicine.

Candidates must be graduates in Arts, and may obtain the degrees at the same commencement as the B.A., or at any subsequent one. The Medical Education of a Bachelor in Medicine is of four years' duration, and comprises the following lectures.

Winter Courses.—Anatomy and Physiology; Practical Anatomy; Surgery; Chemistry; Practice of Medicine; Midwifery; Practical Histology.

Summer Courses.—Botany; Materia Medica and Pharmacy; Institutes of Medicine; Medical Jurisprudence and Comparative Anatomy; Heat; Electricity and Magnetism.

Hospital attendance on a Medico-Chirurgical Hospitall during three courses of nine months each, with clinical lectures, including actual attendance on fever; six months Practical Midwifery. Six months' Dissections and three months' Laboratory Instruction in Chemistry are required.

The Courses may be attended at any recognised Medical School.

The fee for the *Liceat ad Examinandum* is £5.

The fee for the degree of M.B. is £11.

Doctor in Medicine.

A Doctor in Medicine must be M.B., or qualified to take that degree, for three years. He must also read a Thesis before the Regius Professor of Physic.

Total fee for this degree, £13.

Bachelor in Surgery

Must be a B.A., and have spent four years in the study of Surgery and Anatomy. (*a*)

The curriculum comprises the following, in addition to the Course for the M.B.:—

Theoretical and Operative Surgery ... One Course.
Dissection ... ... Two Courses.
Ophthalmic Surgery ... ... One Course.

Candidates are required to perform operations on the dead subject.

Candidates for the B.Ch. who have already passed the M.B. will be examined in Anatomy and Surgery only.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the degree of Bachelor in Surgery, £1.

Master in Surgery

Must be a B.Ch. for three years' standing, and must read a Thesis.

Fee for the degree of Master in Surgery, £11.

Master in Obstetric Science

(a Degree lately founded by order of the Board of T.C.D.).

A Master in Obstetric Science must have passed the M.B. and B.Ch. Examinations, and produce Certificates of having completed the following Curriculum :—

1. One Winter Course in Midwifery.
2. Six months' practice in a recognised Lying-in Hospital or Maternity.
3. A Summer Course in Obstetric Medicine and Surgery.
4. Two months' practice in the Cow-pock Institution.

Graduates in Medicine of M.D. standing may present themselves for examination without complying with Regulations 3 and 4.

Fee for the degree of M.A.O., £5.

UNIVERSITY LICENCES.

Candidates for the Licences in Medicine or Surgery must be matriculated in Medicine, and must have completed *two years in Arts.*

Licentiate in Medicine.

The Course and Examination are the same as for the M.B.

An L.M., on proceeding to the degree of B.A., may become a B.M. on paying the fees without further examination.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the Licence in Medicine, £5.

Licentiate in Surgery.

The Course and Examination necessary for the Licence in Surgery is the same as for the degree of Bachelor in Surgery.

Fee for the *Liceat ad Examinandum*, £5.

Fee for the Licence in Surgery, £5.

MEDICAL SCHOLARSHIPS.

Two Medical Scholarships are given annually, value £20 per annum each, tenable for two years, the examinations for which are held each year in June, in the following subjects :—Anatomy and Physiology, Chemistry, Materia Medica, Botany, Experimental Physics, and Comparative Anatomy.

Medical School Exhibitions.

The Professors of the University School give three Exhibitions annually, two senior, value £15 and £10, open to all students who have been three years attending the school, the subjects being—Practice of Medicine, Surgery, Pathology, and Forensic Medicine ; one junior, value £15, the time and subjects of examination being the same as those for the Medical Scholarship.

The Board of Trinity College have recently passed orders—1. That three-fourths of the lectures must be attended. 2. That a daily roll be called by each Professor.

Students entering for Demonstrations and Dissections are required to pay £8 8s. before November 25 ; Dissections only £5 5s. ; Demonstrations only £3 3s. ; fourth year's Dissection £2 2s.

THE QUEEN'S UNIVERSITY IN IRELAND.
FACULTY OF MEDICINE.

DEGREE OF M.D. AND M.CH.

EACH candidate for the degree is required—

1. To have passed in one of the Queen's Colleges the examination for Matriculation in Arts. 2. To have attended in one of the Queen's Colleges lectures on one Continental language for six months, and on Natural Philosophy for six months ; also two Medical Courses. For the remainder of the medical courses, certificates will be received from any recognised lecturer. 3. To pass three University Examinations.

The Medical Curriculum is divided into two periods of two years each.

The first period comprises attendance on Chemistry, Natural History, Anatomy and Physiology, Practical Anatomy and Materia Medica, Practical Chemistry in a recognised laboratory, and six months of a medico-chirurgical hospital.

The second period comprises Anatomy and Physiology, Practical Anatomy, Surgery, Midwifery, and Diseases of Women and Children, Medicine, Medical Jurisprudence, Practical Midwifery, and eighteen months' Hospital Practice.

At least two of the above courses of lectures must be attended in some one of the Queen's Colleges.

The University Examinations are held twice in each year, in June and September.

Each candidate for examination must forward to the Secretary, before the 20th of May and 20th of August respectively, notice of his intention to offer himself, along with his certificates.

THE FIRST UNIVERSITY EXAMINATION IN MEDICINE

comprises a modern language, Experimental Physics, Zoology, and Botany.

Students may present themselves at any time after the close of the first winter session. Before being admitted to examination each candidate must produce evidence of having completed the prescribed course.

THE SECOND UNIVERSITY EXAMINATION IN MEDICINE

comprises the following subjects :—Anatomy, Physiology, Materia Medica, and Chemistry, to which will be added Zoology and Botany in the examination of candidates who have not previously passed the first examination. Such candidates may either undergo their examination in Modern Languages and Experimental Physics as a part of the second examination, or at any time between the second and the degree examination.

Students may present themselves for the second examination at the termination of the first period of the curriculum, or at any subsequent period, but no student can postpone his second examination until he presents himself for his degree examination.

DEGREE EXAMINATIONS IN MEDICINE AND SURGERY AND EXAMINATION FOR THE DIPLOMA IN MIDWIFERY.

The Examination for the M.D. comprises the subjects recommended for study during the second period.

The Examination for the M.Ch. comprises Surgery, including Operative and Clinical Surgery.

The Examination for the Diploma in Midwifery comprises the Theory and Practice of Midwifery, and the use of obstetrical instruments and appliances.

(*See Advertisements of Queen's Colleges, Belfast, Galway, and Cork.*)

Official regulations may be obtained from G. J. Stoney, Esq., Queen's University, Castle Street, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

LETTERS TESTIMONIAL, OR THE L.R.C.S.I.

The examination is divided into two parts, known as the first and second halves.

The junior class must produce certificates of—

a, Preliminary examination, including Greek; *b*, three courses of lectures on anatomy and physiology; *c*, three on practical anatomy, with dissections; *d*, two on chemistry; *e*, one on materia medica; *f*, one on botany; and *g*, one on forensic medicine. This class is examined in anatomy, histology, physiology, materia medica, and chemistry.

The senior class must produce certificates of—

a, Three courses on surgery; *b*, one on practice of medicine; and *c*, one on midwifery; also attendance on a recognised hospital for three winter and three summer sessions. This class is examined in surgery, operative surgery and appliances, practice of medicine, medical jurisprudence, and prescriptions.

The fees are: £5 5s. as registered pupil of the College; £5 5s. for the Junior Class Examination, which is not returned in case of rejection, but is allowed in the fee for his second examination; £15 15s. for the Senior Class Examination—total £26 15s.

Pupils *who neglect registering themselves previous to going in for the preliminary examination*, must pay 10s. for that examination, to which, however, registered pupils, in addition to their other privileges, are free.

Every candidate rejected at the quarterly examination is required to pay to the College the sum of £2 2s. on applying for re-examination.

Method of Examination.—Candidates must lodge their fees and certificates one week before the day.

Junior Class.—The candidates are examined in alphabetical order, and the examination occupies three days: 1st day, dissections; 2nd day, written examination on anatomy, physiology, histology, materia medica, and chemistry; 3rd day, *viva voce* examination on the same subjects. No candidate can proceed to the second day who has not passed the first; or to the third, who has not passed the second.

Senior Class.—The examination occupies four days; 1st day, written examination on surgery, practice of medicine, medical jurisprudence, and prescriptions; 2nd day, *viva voce* examination on surgery and practice of medicine; 3rd day, clinical examination; 4th day, operative surgery.

No candidate can present himself for examination after the first day who has not satisfied his examiners upon the previous day; but all candidates who have passed any day's examination get credit for same. When presenting themselves upon a subsequent occasion, a former candidate is only required to present himself upon that portion of the examination in which he had failed.

Midwifery.—After passing the L.R.C.S., the student is admitted to examination for the diploma in Midwifery upon producing a certificate of one course on Midwifery and Diseases of Women and Children; a certificate that he has attended a lying-in-hospital for six months; and a certificate that he has conducted thirty labour cases at least.

Candidates are examined on the Organisation of the Female, the Growth and Peculiarities of the Fœtus, the Practice of Midwifery, and the Diseases of Women and Children.

The candidate pays £1 6s. for the Midwifery diploma, provided he takes it out within one month from the date of his Letters Testimonial; after that date, £2 2s.

Official information may be had on application to Mr. J. Brennen, Royal College of Surgeons, Dublin.

KING AND QUEEN'S COLLEGE OF PHYSICIANS IN IRELAND.

REGULATIONS RESPECTING LICENSES IN MEDICINE AND MIDWIFERY.

I.—Examinations for the licences of the college in medicine and midwifery are held in the week following the first Friday in each month, except August and September.

II.—Every candidate for either license must return his name to the registrar, and lodge his certificates, bank receipt of fees, and his schedule, (*a*) at least *four* days before the first Friday in each month.

THE LICENSE IN MEDICINE.

Every candidate is required to produce satisfactory evidence:—

1. Of character, from a Fellow of the College, or from two registered practitioners.

2. Of having passed an examination in general education, held by some of the recognised examining bodies.

3. Of having been engaged four years in the study of medicine.

4. Of having attended lectures on the following subjects, at recognised schools.

Practical Anatomy, two courses. Physiology or Institutes of Medicine, one course. Chemistry, one course. Practical Chemistry, one course. Materia Medica, one course. Medical Jurisprudence, one course. Practice of Medicine and Pathology, one course. Surgery, one course. Midwifery, one course.

5. Of twenty-seven months, at a Medico-Chirurgical Hospital, in which clinical lectures and clinical instruction in medicine are given; and of nine months of a clinical hospital which contains wards for the treatment of the infectious fevers (*b*)—said nine months being included in the total period of twenty-seven months.

6. Of having attended practical midwifery and diseases of women for six months at a recognised Lying-in Hospital, or Maternity; or, where such hospital attendance cannot have been obtained during any period of the student's course of study, of having been engaged in practical midwifery under the supervision of a registered practitioner holding public appointments; not less than twenty labour cases to be actually attended.

III.—The professional examination is divided into two parts:—

First Part.—Anatomy, Physiology, Chemistry, and Materia Medica.

Second Part.—Practice of Medicine, Clinical Medicine, Pathology, Medical Jurisprudence, Midwifery, Hygiene, and Therapeutics.

Candidates may be examined in the subjects of the first part at the termination of the second year of study, on producing the certificates in these subjects prescribed by Rule III.; or in all the subjects of their education, on the completion of their medical studies. No candidate can be examined in all the subjects of the first and second parts in the same month.

Graduates and diplomates of recognised Universities and Colleges are required to undergo the *second part only* of the professional examination. Also candidates who, having completed the curriculum laid down in Rule III., shall have passed the previous professional examination, or examinations, of any of the licensing medical authorities.

IV.—Any registered practitioner of *five* years' standing shall be admitted to examination for the license of the College, on producing his certificate of registration, with satisfactory reference, and shall have the privilege of being exempted from the examination by printed questions.

Each candidate shall be examined separately, and shall be required to recognise pathological specimens, and undergo such other practical tests as the examiners shall select.

THE LICENSE IN MIDWIFERY.

Candidates for the license in midwifery, who

(*a*) Blank schedules are to be obtained on application at the College, or by letter addressed to the Registrar, College Hall, Kildare Street, Dublin. It is particularly requested that candidates applying by letter will state *whether they already possess any qualification*, as the form of schedule for those who have differs from that required to be filled up by those who have not, obtained any diploma.

(*b*) This rule to be enforced in the case of all candidates who commenced their studies since September, 1876.

are not licentiates in medicine, may be admitted to examination on the following qualifications:—

(1) The degree or license from any University or College in the United Kingdom; (2) testimonials as to character; (2) certificates of having attended (*a*) a course of lectures on midwifery in a school, recognised by the College (see Rule III). (*b*) Practical midwifery and diseases of women, for six months, at a Lying-in Hospital, or Maternity recognised by the College; or where such hospital attendance cannot have been obtained during any period of the candidate's course of study, of having been engaged in practical midwifery under the supervision of a registered practitioner, holding a public medical appointment,—the certificate, in either case, to state that not less than twenty labour cases have been actually attended.

Candidates who are already licentiates in medicine of the College, or who have passed the examination for such license, may be admitted to examination for the license in midwifery on lodging their fees, and signifying their wish to the registrar a week, at least, before such examination.

X.—Any registered practitioner of *five* years' standing shall be admitted to examination for the license in midwifery, on producing his certificate of registration, with satisfactory reference; and he shall have the privilege of being exempted from the examination by printed questions.

FEES FOR LICENCE AND EXAMINATIONS.

XI.—Licence in medicine, fifteen guineas, which may be divided as follows, viz.:—

For examination at the termination of the first period of study, five guineas.

For final examination for the license, ten guineas.

XII.—License in midwifery, three guineas.

XIII.—Fee for examination for the licenses in medicine and midwifery, if obtained within the interval of a month, sixteen guineas—to be lodged in one sum. (*a*)

XIV.—Fee for special examination for the license in medicine, twenty guineas.

XV.—Fee for special examination for the license in midwifery, five guineas.

XIV.—Fee for examination for the license to practise as a midwife and nurse-tender, one guinea.

THE APOTHECARIES' HALL, IRELAND.

THE ARTS EXAMINATIONS

Will be held at the Hall four times in the year, viz., the third Thursday in the months of January, April, July, and October, at the hour of twelve o'clock, noon.

The Examination for *the Licence* is divided into two parts:—

The First Part comprehends Chemistry, Botany, Anatomy, Physiology, Materia Medica, and Pharmacy.

The Second—Medicine, Surgery, Pathology, Therapeutics, Midwifery, Forensic Medicine, and Hygiene.

THE PROFESSIONAL EXAMINATIONS

Will be held *quarterly*, on the first and second Mondays in January, April, July, and October.

The First Part, on the first Monday, at twelve o'clock noon, and on the Tuesday and Wednesday succeeding at the same hour.

Subjects.—Chemistry and Botany, Monday; Anatomy and Physiology, Tuesday; Materia Medica and Pharmacy, Wednesday.

The Second Part, or Pass Examination, on the second Monday, at twelve o'clock noon, and on the Tuesday and Wednesday succeeding at the same hour.

Subjects.—Medicine and Surgery, Monday; Midwifery and Diseases of Women and Children, Tuesday; Forensic Medicine and Hygiene, Wednesday; Clinical Examination, Thursday.

The first two hours of each day will be devoted to writing answers, and after that, two hours to an oral and practical examination.

Candidates at the examination on Anatomy are liable to be called on to perform *dissections;* and at the examination on Surgery to perform one or more *operations* on the dead subject.

Doctors of Medicine and Licentiates of a College of Physicians or Surgeons who have also spent twelve months at *Practical* Pharmacy, may obtain the Licence by undergoing an examination—the former in Pharmacy and the latter in Medicine and Pharmacy. Licentiates of the London Society of Apothecaries are admitted *ad eundem.*

(*a*) Any candidate who has been rejected at the examination for the license in medicine loses this privilege, and shall be required to pay the full fee of £3 3s. for the license in midwifery.

PHARMACEUTICAL SOCIETY OF IRELAND.

THIS Corporation was created by Act of Parliament in 1875, and has just completed its third year of existence, its function being to license pharmaceutists and chemists in Ireland, hitherto solely qualified by the Apothecaries' Company. The regulations for the coming year will be as follows:—

PHARMACEUTICAL EXAMINATION.

Candidates must be twenty-one years of age, and have passed the preliminary at least one year previously, and must also have been practically engaged in compounding and dispensing for at least two years under the instruction of a pharmaceutical chemist or apothecary. Examinations on first Wednesday of January, April, July, and October. Examination for the Preliminary on the first Monday in those months.

Botany.—To recognise the principal indigenous plants used in medicine, to refer them to their natural orders, and to give the definitions and the distinctive characters of their several parts.

Materia Medica.—Recognise specimens of the drugs of the Pharmacopœia, describe their characters and active principles, name sources from which obtained, and the officinal preparations into which they enter, and to detect adulterations.

General and Pharmaceutical Chemistry.—The elementary laws of chemistry and physics, including chemical equations. To recognise the chemical substances of the Pharmacopœia, to describe processes by which obtained; qualitative analysis, including the tests of the Pharmacopœia and volumetric analysis, and to submit to a practical examination in these subjects.

Practical Pharmacy.—To translate Latin prescriptions, to detect dangerous doses, to compound and dispense correctly. Explain the processes of making the non-chemical preparations of the Pharmacopœia, and to recognise them. Fee, Preliminary, £2 2s.; License, £5 5s. In case of rejection, the sum of £2 2s. will be retained, and a candidate may not present himself for six months.

MEDICAL SCHOOLS AND HOSPITALS IN DUBLIN.

SINCE our last issue an important change has been made in hospital arrangements. The system of perpetual pupils, under which a student, binding himself to one hospital, received a discount off his fees, has been abolished, and he is free to go elsewhere as he pleases. Uniformity of fees has also been established, and the fee for all hospitals is now £8 8s. for winter (six months), £5 5s. for summer (three months), or £12 12s. for nine months. This arrangement, although involving an increase of fees, is very much to be approved of.

The Clinical Hospitals of Dublin are ten in number, exclusive of the Cork Street Fever Hospital, St. Mark's Ophthalmic Hospital, the Children's Hospital in Pitt Street, and other special institutions. To some of the Clinical Hos-

pitals Medical Schools are attached; others, though they have no actual or official connection with any school, are in close affinity with certain teaching bodies, while others again are without any special connection with any school. While, however, such affiliation of a school and hospital may exist, it should be remembered that the Dublin schools and hospitals are open to all comers, and the student is competent to attend any hospital and any school he wishes.

The Names of the Professors, Lecturers, and Hospital Staff of the following Hospitals and Schools are not included in this column, being found in the advertisement of each institution.

School of Physic and Sir Patrick Dun's Hospital.—The Medical School of Trinity College is one of the largest and most important. It is especially frequented by those students who intend to take the Arts Curriculum of the University, but is freely open to, and largely availed of by other students. It is under the immediate supervision of the Rev. Professor Haughton, the Medical Registrar of the University, and the names of its Professors will be found appended to the advertisement in our journal. Two Medical Scholars are elected annually by the Board of Trinity College, at an examination held at the end of June. Each scholarship is worth £20 per annum, and is tenable for two years. The Professors of the School of Physic give three exhibitions annually, amounting altogether in value to £40, subject to conditions prescribed by the Professors themselves.

Sir Patrick Dun's is the hospital attached by Act of Parliament to the School of Physic, and officered by the Professors of that school. It was for many years a purely medical hospital, but is now a large medico-chirurgical hospital, with a Midwifery Maternity attached.

The Royal College of Surgeons School is situated within the walls of the College, and is under the superintendence of the Council, who appoint the Professors. The Professor of Physiology commences his course with a series of twelve lectures on Comparative Anatomy—free to the public. The dissecting-rooms have recently been much enlarged. Prizes in Anatomy and Physiology, and Surgery will be awarded at the end of the Winter Session. Junior Exhibition of £15, a Senior Exhibition of £25, and Honorary Certificates will be awarded at the end of the Winter Session.

The City of Dublin Hospital has been hitherto more closely connected with the College School than any other hospital. It is situated in Upper Baggot Street, about ten minutes' walk from the Royal College of Surgeons. The hospital contains 130 beds, and accommodates about 1,300 intern patients annually. There are special wards for ophthalmic and aural diseases (on which subjects a special course of lectures is delivered), and for diseases of children. A new wing has been lately opened for the reception of fever and other infectious diseases. The "Purser" Studentship of £30 per annum (with apartments) is obtainable by competitive examination by all students; numerous prizes and medals are given, and special certificates are granted.

The Catholic University School is situated in Cecilia Street, about ten minutes' walk from the University itself in St. Stephen's Green. Most of its Professors are physicians and surgeons of the Mater Misericordiæ, St. Vincent's, or Jervis Street Hospitals, and its courses of study qualify for admission to all the licensing bodies. The University itself does not grant degrees in medicine or surgery, being as yet unchartered, but the School is instrumental in the education of a large proportion of the Catholic students of Ireland. The University grants an Exhibition of £20, a gold medal, value £7, and class prizes. There is no residence for students.

The hospitals most closely connected with this School are St. Vincent's, in St. Stephen's Green; the Mater Misericordiæ Hospital, in Eccles Street; Jervis Street Hospital; and House of Industry Hospital.

St. Vincent's Hospital was established in 1834 by the Sisters of Charity, some of whom had studied the system of the Parisian Hospitals, after which it was modelled. The ward for "*Enfans Malades*" is an interesting feature. The hospital has over 100 beds constantly full, and each sister has charge of about twelve patients. In connection with it is the Convalescent Home at Lindon Grove, Blackrock. The clinical instruction in medicine and surgery is given by Dr. Quinlan, Dr. Mapother, Dr. O'Leary, and Dr. Cryan.

A Special Ward for the treatment of the Diseases of Women has been opened under the care of Dr. J. A. Byrne, Gynæcologist to the Hospital.

The Mater Misericordiæ Hospital is the largest of the Dublin Hospitals, and is intended to be much extended. It is situated at the northern side of the town. The new wing is specially reserved for the admission of cases of fever and other contagious diseases. A special course on these subjects is given.

There are four resident pupils appointed every six months. Good lodgings can be had very cheap close to the hospital. Prizes to the value of £30 are awarded at the end of the winter session for the best reports on the cases under treatment in the hospital.

Jervis Street Hospital is one of the oldest established charitable institutions in Dublin, having been founded in 1721. It is situated in a part of the city not otherwise provided with hospital relief, and which, from its commercial character, supplies the hospital with an abundance of surgical cases. Like St. Vincent's Hospital, its nursing arrangements are under the charge of a community of Sisters of Charity. The hospital, being found inadequate to the demands upon it, is in process of being rebuilt.

The Ledwich School was founded in 1810 by the well-known Dr. Kirby, and since then has fully sustained its prestige under the management of the Messrs. Ledwich and Mason. Its name was bestowed upon the school as a tribute of respect to the late T. H. Ledwich, who sacrificed a life in an increasing effort to promote its welfare. It is situated in Peter Street, not five minutes' walk from the College of Surgeons, the Meath, Vincent's, and Mercer's Hospitals, and in the same street with the Adelaide Hospital and the Coombe Lying-in Hospital, and ten minutes' from the Catholic University School, the School of Physic, and the City of Dublin Hospital. No Introductory Lecture will be given at this school.

Mercer's Hospital, founded A.D. 1750, William Street.—This hospital is situated in the centre of the metropolis, in the midst of a densely-crowded population, and its doors are open at all hours for the reception of accidents and of acute cases. Dispensaries are held daily, and are largely attended. Special instruction is given in cutaneous and infantile diseases. From the large number of accidents which from its position come to the hospital, students are afforded ample opportunities of rendering themselves familiar with the nature and treatment of disease in its various forms, and of acquiring dexterity in the dressing and manual operations of minor Surgery.

Richmond, Whitworth, and Hardwicke Hospitals.—Accommodation: Hardwicke Hospital, 120 beds; Whitworth Hospital, 82 beds; Richmond Hospital, 110 beds; total, 312 beds.

The hospitals are visited each morning at nine o'clock by the physicians and surgeons, and, in addition to the usual bedside instruction, Clinical Lectures are delivered on the most important cases. Special instruction is also given on various branches of Medicine and Surgery.

The Truss Establishment, for the distribution of trusses to the ruptured poor of Ireland, is connected with these hospitals. There is a very large ophthalmic, aural, and dental dispensary, and the respective surgeons give instruction in these important subjects.

Eight resident Clinical Clerks and the dressers are appointed each half-year, and provided with furnished apartments, fuel, &c., &c. These appointments are open not only to advanced students as formerly, but also to those who are qualified in medicine or surgery. A House Surgeon for the Richmond Hospital is elected biennially, and receives a salary.

The Richmond Lunatic Asylum, containing 1,000 beds, adjoins these hospitals.

The Carmichael School, as we announced some weeks ago, is about to be transferred from its present site in North Brunswick Street to premises situated at the corner of Aungier Street and York Row. The staff has been considerably increased. Mr. Loftie Stoney the well-known demonstrator at the College of Surgeon's School, has become joint lecturer on Anatomy. Mr. Barton, formerly Lecturer on Surgery at the Ledwich School, joint lecturer with Mr. Corley on

Surgery, and Dr. Macan, joint with Dr. Jennings on Midwifery. Mr. Lambert Ormsby and Mr. Antony Roche, are also important additions to the staff as demonstrators. The school in its new premises, which promise, when complete, to be very commodious and eminently suited to the requirements of modern practical teaching, will be in immediate proximity to the Meath, Adelaide, and Mercer's Hospitals, and it will be connected by its teachers, not only with these hospitals, but also with the House of Industry, the Mater Misericordiæ, and the City of Dublin. Two Scholarships, the "Mayne" and the "Carmichael," each value £15, and prizes to the value of over £60 on the foundation of the late Mr. Carmichael, are offered annually. The Carmichael Scholarship is for students commencing their third year, and will be examined for in the last week in October. The examination for the "Mayne," and for the other Prizes, will not be held until the close of the Session.

DR. STEEVEN'S HOSPITAL AND SCHOOL are situated close to the Kingsbridge Terminus of the Great Southern and Western Railway, and therefore occupy a position of their own, far removed from the other medical institutions.

Immediately adjoining is St. Patrick's (Swift's) Asylum for the Insane.

There is accommodation for residence of seven surgical and four medical residents; besides whom the resident-surgeon receives house pupils. The fees payable for the privilege of residence are twenty-one guineas, winter; fifteen guineas summer six months. Students have apartments, coal, gas, and furniture.

Accommodation outside the hospital, in the neighbourhood, is arranged by the hospital authorities.

The examination for two Midwifery Assistants is held on the last Saturday in November. Salary £30.

Candidates must be in at least their second year, have attended Practical Midwifery in the Maternity Department, and be entered on the books of the school.

Gold medals will be awarded in each year's class.

As we have said, certain hospitals have no special affinity with any college or school. Of these are the Meath and Adelaide Hospitals.

The MEATH HOSPITAL, which is also the public infirmary of the county of Dublin, containing 120 beds, and now in the 125th year of its existence, ranks among the oldest of the charitable institutions of this city. It is situated on the southern side of the city, upon about three acres of ground, formerly called "The Dean's Vineyard." The original Meath Hospital, situated on the Coombe, was opened in 1753. The foundation-stone of a new Meath Hospital, on the Coombe (now the Coombe Lying-in Hospital), was laid out by Lord Brabazon, 10th October, 1770; this hospital was, in 1774, constituted the County Dublin Infirmary by Act of Parliament. The present building, in Heytesbury Street, was opened in 1822, since which time the building has undergone considerable enlargements and improvements. In 1830 the theatre for operations and lectures was erected. In 1852-3 the Collis Wards were added as a memorial to Maurice Collis, twenty-five years surgeon to the hospital. In 1865 the "Smyly Ward," built for the special accommodation of children, was opened by the Lord-Lieutenant, Lord Wodehouse.

The ADELAIDE HOSPITALS, recently much enlarged, are in Peter Street, next door to the Ledwich School, and within a few minutes' walk of the College of Surgeons and the Universities. From the 1st of October the physicians and surgeons will visit the wards, and give instruction at the bedside, at the advertised hours.

There is a large detached fever hospital and also wards for infants and children. Special hours are devoted to clinical instruction in the Diseases Peculiar to Women, and students are individually instructed in the use of the Stethoscope, Ophthalmoscope, Laryngoscope, and Microscope. Two resident pupils are selected half-yearly. Prize examinations are held at the termination of the Session. The large dispensaries afford facilities for the study of eye, ear, throat, and cutaneous diseases, as well as minor Surgery.

SPECIAL HOSPITALS.

The Special Hospitals of Dublin are the Rotunda and Coombe Lying-in Hospitals, the Westmoreland Lock Hospital, Cork Street Fever Hospital, Pitt Street Children's Infirmary, St. Mark's Ophthalmic Hospital, two Orthopædic Hospitals, and the National Eye and Ear Infirmary.

COOMBE HOSPITAL.—This hospital has been rebuilt and refurnished, and has sixty-five beds, was founded in 1826, and was incorporated by Royal Charter in 1867, thus enabling its medical officers to issue diplomas qualifying the holders to practise midwifery. This hospital is situated in the centre of a district densely populated by the lower orders, and thus affords the amplest opportunities for practice. It receives about 700 labour cases within its walls, while those attended as extern amount to nearly double that number. Moreover, the chronic ward for the reception of cases of the diseases of females give admission to about 80 patients annually. The fee for attendance is £8 8s. for six months as extern, and £18 18s. as intern pupil. During that period the student attends on given nights in each week, or oftener, if circumstances permit, and takes charge in his turn of any case that may be admitted to the labour wards, or may call for his assistance outside. An annual examination is held in May and November, at which prizes of considerable amount are awarded, and certificates of good answering granted. Two paid resident pupil midwifery assistantships, and a paid clinical clerksip, are obtainable annually, by competitive examination, for which all pupils who have obtained their midwifery diplomas are eligible.

The PITT STREET CHILDREN'S INFIRMARY, established 1821, is situated close to Mercer's Hospital and the College of Surgeons. It was founded to provide treatment specially for children, and to teach that special branch of Disease. Dr. Moore and Dr. Churchill are the medical officers.

ST. MARK'S OPHTHALMIC HOSPITAL AND DISPENSARY FOR DISEASES OF THE EYE AND EAR.—This is the oldest and largest special ophthalmic hospital in Dublin, and was founded by Sir William Wilde. Instruction is given on the mornings of Mondays, Tuesdays, Thursdays, and Fridays, from 11 to 1 o'clock, and operations are performed on Wednesdays and Saturdays from 11 to 1 o'clock. A surgeon resides in the institution, and receives a salary of £80, besides rooms, gas, coal, &c.

THE ROTUNDA HOSPITAL.—This well-known and time-honoured institution possesses a character as a School of Midwifery which needs no comment. It is not, however, as generally recognised as it deserves to be, as also a great school of gynæcology. The institution consists, in fact, of two distinct hospitals—viz., the lying-in hospital, into which some 1,200 cases of labour are admitted annually, and the Hospital for the Treatment of Diseases peculiar to Women, in which some 500 patients are now annually admitted during the course of the year. The present master, Dr. Lombe Atthill, as is well known, devotes special attention to this department of the charity. There is every facility for the study of the special departments of medicine to which the hospital is devoted, and both students and midwives are granted a diploma on passing an examination.

The Clinical Clerkship, value £30 a-year, tenable for six months, is adjudged, after open competitive examination, to any pupil who has attended the full course of instruction in the hospital, but who has not obtained a registerable qualification.

CORK STREET HOSPITAL is the only special fever hospital in Dublin, contains 120 beds, and is mainly supported by Government. One or more medical pupils are elected by the Governors for a six months' residence, for which a special certificate is given. Extern Students are also admitted for the same term. Fee, three guineas. Further particulars of Dr. Atkins, Registrar.

NATIONAL ORTHOPÆDIC HOSPITAL OF IRELAND for the treatment of Club-foot, Contractions and Distortions of the Limbs, Spinal and all other Bodily Deformities, 7 Upper Kevin Street, Dublin.—Mr. Ormsby attends daily from 11 to 12 o'clock, and gives Clinical instruction on the intern cases.

The hospital is capable of containing 25 beds, for the reception of severe cases of deformity. There is a large dispensary for extern patients held on Tuesday, Friday, and Saturday, 11 to 12. Operations performed on Fridays. Students and practitioners are allowed to attend the Clinical instruction.

Dublin Orthopædic Hospital, 11 Usher's Island, contains 20 beds for the treatment of deformities, and an Infirmary for Contagious Disease should such occur. It is under the surgical management of Mr. Swan, of Steeven's Hospital. Six beds are free.

The Dental Hospital of Dublin.—This is the only hospital in Dublin solely devoted to the treatment of Diseases of the Teeth and Deformities of the Mouth, which will afford gratuitous relief to the suffering poor. It is open daily from 9 to 10 a.m.

Cork Ophthalmic and Aural Hospital has a special throat department, it is the only special institution of the sort in the south of Ireland, and is under the care of Dr. H. Macnaughton Jones. It contains twenty-six beds, and has an average extern attendance of 1,700 patients. A Resident Pupil is chosen every three months, and Clinical Assistants are appointed by the Surgeon.

INTRODUCTORY LECTURES IN THE DUBLIN SCHOOLS AND HOSPITALS.

School of Physic—None.
Royal College of Surgeons—Dr Stoker, Oct. 23th, 1 p.m.
Catholic University—Mr. P. J. Hayes.

Mercer's Hospital—None.
Richmond Hospital—Mr. A. H. Corley, Oct. 31, 10 30 a.m.
Mater Misericordiæ Hospital—Dr. Gunn, Oct. 31, 11 a.m.
Rotunda Hospital—None.
Carmichael School—None.
Ledwich School—None.
St. Vincent's Hospital—Dr. O'Leary, M.P., Oct. 31, 11 a.m.

THE QUEEN'S COLLEGES.

These three important institutions are the special schools of the Queen's University, and are situated in Belfast, Galway, and Cork. They receive a large subvention from the public funds, and are provided with every facility for the education of their students. It is essential that every candidate for the medical or surgical degrees of the Queen's University shall have attended courses of lectures in Modern Languages, Natural Philosophy, and at least two medical subjects, in one of the provincial colleges, so that attendance at a Queen's College during one of the years of medical study is compulsory upon all candidates for the licences of this University.

A detail of the prizes and exhibitions in arts and medicine, the names of the professors, and other information, *will be found in the Advertisements* of this issue, and full details may be had on application to—

Belfast.—John Curran, M.A., Registrar.
Cork.—Alexander Jack, M.A.
Galway.—Arthur Hill Curtis, M.A., LL.D.

MEDICAL EDUCATION IN SCOTLAND.

THE UNIVERSITIES.

The fees for the degrees in all four of the Scotch Universities are the same—viz., M.B., £15 15s. (£5 5s. being payable at each of the three examinations); C.M., £5 5s. (in addition to the fees of M.B.); M.D., £5 5s. (in addition to the fees for M.B.); and £10 for Government stamp.

UNIVERSITY OF EDINBURGH.

This is a qualifying and teaching body, and has complete Faculties also of Theology and Law equally with Medicine. Prior to commencing medical studies the student must pass a preliminary examination in English, Latin, and Arithmetic, the elements of mathematics, and the elements of mechanics. An examination in at least two of the following subjects is demanded before being admitted to a professional examination, in addition to the foregoing subjects—viz., Greek, French, German, Higher Mathematics, Natural Philosophy, Logic, Moral Philosophy. The University confers three degrees—medical and surgical qualifications being granted—M.D., M.B., and C.M. The C.M. is not conferred unless the M.B. be taken at the same time. For the degrees of M.B. and C.M. four years of professional study must be completed after passing a preliminary education recognised by the Medical Council. A degree in Arts of any British University is held to supersede the preliminary examination. Of the four years of professional study, one must be passed in the University of Edinburgh, and another of such four years must be in some other University entitled to grant the degree of M.D. The M.D. degree is conferred on Bachelors of Medicine who have attained the age of twenty-four years, and who present a thesis to be approved by the Medical Faculty. The lectures of several extramural lecturers in Edinburgh, as well as those at the London medical schools, and such teachers in the provincial schools approved by the University Court, are recognised, subject to certain conditions.

Every candidate for the degrees of M.B. and C.M. must give sufficient evidence by certificates—1. That he has studied each of the following departments of medical science—namely, Anatomy, Chemistry, Materia Medica, Institutes of Medicine or Physiology, Practice of Medicine, Surgery, Midwifery and the Diseases peculiar to Women and Children, and General Pathology, each during courses including not less than one hundred lectures; Practical Anatomy, a course of the same duration as those of not less than one hundred lectures; Practical Chemistry, three months, Practical Midwifery, three months at a midwifery hospital, or a certificate of attendance on six cases from a registered medical practitioner; Clinical Medicine, Clinical Surgery, courses of the same duration as those of not less than one hundred lectures, or two courses of three months' lectures being given at least twice a week; Medical Jurisprudence, Botany, Natural History (including Zoology), during courses including not less than fifty lectures. 2. That he has attended, for at least two years, the medical and surgical practice of a general hospital which accommodates not fewer than eighty patients, and possesses a distinct staff of physicians and surgeons. 3. That he has been engaged, for at least three months, by apprenticeship or otherwise, in compounding and dispensing drugs at the laboratory of a hospital, dispensary, member of a surgical college or faculty, licentiate of the London or Dublin Society of Apothecaries, or a member of the Pharmaceutical Society of Great Britain. 4. That he has attended, for at least six months, by apprenticeship or otherwise, the out-practice of a hospital, or the practice of a dispensary, physician, surgeon, or member of the London or Dublin Society of Apothecaries.

UNIVERSITY OF ST. ANDREW'S.

This University confers the degree of M.D. (certain exemptions being made to ten practitioners yearly), M.B., and C.M. Two years of study of each candidate must be in one or more of the following Universities—viz., the University of St. Andrew's, Glasgow, Aberdeen, Edinburgh, Oxford, and Cambridge; Trinity College, Dublin; Queen's College, Belfast; Queen's College, Cork; and Queen's College, Galway.

The degree of M.D. is conferred on any registered practitioner above the age of forty whose professional position is such as to entitle him to that degree, and who shall, on examination, satisfy the examiners of the sufficiency of his professional knowledge; provided always that degrees will not be conferred, under this section, to a grater number than ten in any one year. The examinations are held yearly, towards the end of April. Candidates must lodge with the Dean of the Medical Faculty the following certificates, along with application for admission to examination:—1. A certificate of age, being a

baptismal certificate or an affidavit of age. 2. Holograph certificates from at least three medical men of acknowledged reputation in the medical profession or in the medical schools, recommending the candidate to the Senatus for the degree, and testifying to his professional skill and position. As only ten can graduate early, candidates will be selected whose service and certificates seem to the Medical Faculty to present the highest professional claims, and where these seem equal preference will be given to age and priority of application. 3. Candidates, when notified for examination, shall remit a portion of the graduation fee (viz., £15 15s.) This sum shall be forfeited should the candidate fail to appear, or to graduate, at the time appointed. 4. A satisfactory examination, written and *vivâ voce*, must be passed in the following departments—viz., Materia Medica and General Therapeutics, Medical Jurisprudence, Practice of Medicine and Pathology, Surgery, Midwifery and Diseases of Women and Children.

UNIVERSITY OF GLASGOW.

This is both a teaching and examining body. It confers three degrees, viz.: Bachelor of Medicine, Master of Surgery, and Doctor of Medicine. Before graduating the student must have been engaged in medical study for four years, one of which must have been spent at the University of Glasgow, and the others at some university or school recognised by the Glasgow University. A *medicus annus* is constituted by two courses of 100 lectures each, or by one course of 100 lectures, and two of 50 each. Two preliminary examinations must be passed, one before commencing study and the other before appearing at the first professional examination. A degree in Arts (not honorary) exempts the student from these examinations. The hospital practice is attended chiefly at the Western Infirmary, to which several of the professors are physicians and surgeons. Numerous other medical institutions exist in the city; and the fact that hospital appointments in this city are virtually life-ones, causes a reasonable and justifiable increase in their number from time to time. The University recognises several extramural lecturers.

Bursaries tenable by Medical Students.—The Brisbane Bursary, of £50 yearly, held for four years by a student of medicine who is a Master of Arts. The Walton Bursary, of £36 yearly, held by a medical student (a native of England being preferred) for four years. The Logan Bursary, of £16 yearly, tenable by a medical student for four years. Two Rainy Bursaries, value £20 per annum each, open to medical students who have just completed the second year of professional study, and tenable for two years. The Armagh Bursaries, three in number, amounting each to £25 yearly, for three years, open to Students of Divinity, Law, and Medicine, who have taken the degree of M.A. The Macfarlane Bursary, value £40 per annum, and tenable for three years, open to students who have attended the first session of their professional study in the University of Glasgow, and who have passed in all the seven subjects of the Preliminary Examination for M.B. The Marshall Bursary, value £17 per annum, and tenable for four years, open to students entering the Medical Faculty, and awarded by competition on the subjects of the Preliminary Examination. The Lorimer Bursary, value £50 per annum, tenable by a medical student for three years.

UNIVERSITY OF ABERDEEN.

This University is entitled to confer degrees in all the Faculties, and is a teaching body as well. The curriculum of study is nearly the same as in the University of Edinburgh. One year must be passed at Aberdeen. Another of such four years must be either in this University or in some other university entitled to give the degree of M.D. With regard to fees, each candidate for the degree of M.B. must pay a fee of £5 5s. in respect of each of the professional examinations. If he desires to be admitted to the degree of M.B. only he will not be required to pay any further fee, in addition to the £15 15s.; but on admission to the degree of C.M. he must pay a further fee of £5 5s. The fee for the M.D. degree is £5 5s., in addition to the fees for the M.B. degree. Besides the Royal Infirmary, students have the opportunity of attending several other local institutions.

THE COLLEGES.

Royal College of Physicians of Edinburgh.—This, like the Sister College of London, is exclusively a qualifying body. In conjunction with the Royal College of Surgeons of Edinburgh, and the Faculty of Physicians and Surgeons of Edinburgh, this College grants a double qualification, and registerable as such. Each applicant for professional examination must previously have passed the preliminary examination prescribed by the General Medical Council. Exemption is made in the case of Masters or Bachelors of Arts of any British University and certain recognised foreign Universities. Candidates who may have already passed the first professional examination of any body approved of by the College will be at once admitted to the second part of the examination.

The Fellowship is conferred only by election, and the candidate must at least have been a member of the College for one year previously, and have attained the age of twenty-five years.

The Membership is conferred on Licentiates of the College, or Graduates of a British or Irish University, with whose knowledge the College may be satisfied, and who has attained the age of twenty-four years.

The Licence.—The regulations are nearly the same as those for the joint examination for the Scotch double qualification.

The Professional Examination will be divided into two parts, according to the following arrangement of subjects: 1. Anatomy, Physiology, Chemistry. 2. Materia Medica and Pharmacy, Pathology and Pathological Anatomy, Practice of Medicine, Surgery, Midwifery, Medical Jurisprudence, Clinical Medicine. No candidate will be admitted to the first examination until the end of his second winter session, or to the second until he has completed four years of professional study. The examinations will be partly oral, partly in writing.

Qualification in Public Health.—The College now confers a certificate of competency in Public Health. The examinations are held in April and October. Fee, £10 10s.

Fees.—The fee payable by a Licentiate is £10 10s. In the case of unsuccessful candidates the fee is returned, minus £4 2s., retained to defray the expenses of examination. The fee to be paid by a member is £31 10s. When a licentiate is raised to the rank of a member, he pays £21. When a member is raised to the rank of a fellow, the fee is £31 10s., exclusive of stamp duty, which amounts to £25. All candidates for fellowship or membership must lodge their fees, and the amount of stamp duty payable at the time to Government, with the treasurer, previously to presenting their petitions.

Royal College of Surgeons, Edinburgh.—Candidates for the diploma of this College must have followed a course of study in some University, or in an established school of medicine, or in a recognised provincial school. Candidates already qualified are admitted on certain exceptional conditions.

Preliminary Examination.—All candidates for the diploma of the College must have passed the complete examination prescribed by the General Medical Council, and have their names inscribed on the register of medical students at the commencement of their medical studies. The preliminary examination of certain recognised bodies is accepted by the College.

Professional Education.—Candidates commencing professional study after September 16, 1866, must have been engaged, during four years after the preliminary general education, in professional study, which shall include not less than four winter sessions, or three winter and two

summer sessions' attendance at a recognised medical school.

Professional Examination.—The professional examination is divided into two, the one oral, the other written. The first examination embraces Anatomy, Physiology, and Chemistry. The second examination embraces Surgery and Surgical Anatomy; also Medicine, Midwifery, Materia Medica, and Medical Jurisprudence; and does not take place prior to the termination of the winter session of the last year of study.

The Fellowship is conferred only on candidates who have obtained a diploma from this College or from either of the Colleges of Surgeons of England or Ireland, or the Faculty of Physicians or Surgeons of Glasgow, and who are twenty-five years of age. The election is by ballot, and three-fourths of the votes are required to be in the candidate's favour, and he has to subscribe certain bye-laws of the College. Fellows are forbidden to keep open shops, to be connected with secret remedies, or indelicate advertisements or publications.

The License.—The regulations are almost the same as those for the joint examinations conducted by the Colleges Physicians and Surgeons.

of In order to test more effectually the practical knowledge of candidates, recent dissections, anatomical specimens, and articles of the materia medica will be employed during the examinations; and all candidates will be required to write out formulæ of prescriptions. They will also be subjected to a practical clinical examination in the surgical hospital, including the application of surgical apparatus, bandages, &c.

No candidate will be admissible to examination who has been rejected by any other licensing board within the three months preceding his application to be examined.

Those candidates who have passed the First Professional Examination before the 31st December, 1878, will be required to pay, as under the old regulation, a fee of £6 for the second examination, provided they appear for that examination prior to 1st January, 1881; and in the event of being unsuccessful £2 will be retained.

THE SCOTCH DOUBLE QUALIFICATION.

The Royal College of Physicians of Edinburgh, by a certain arrangement, grants conjointly with the Royal College of Surgeons of Edinburgh, and the Faculty of Physicians and Surgeons, after one series of examinations, a double qualification, two diplomas being given and registerable under the Medical Act as medical and surgical qualifications, thus: Lic. Roy. Coll. of Phys. Edin. and Lic. R.C.S. Edin., or Lic. Roy. Coll. of Phys. Edin. and Lic. Fac. Phys. and Surg. Glas., according as the case may be.

By the understanding subsisting between these bodies, the College of Physicians take exclusive charge of the examination in medicine; and the College of Surgeons or the Glasgow Faculty, of that in surgery; while departments common to both medicine and surgery are examined by a board in which each body is represented. Such arrangements as these were contemplated by the Medical Act, and authorised by Section XIX., and those under consideration were sanctioned by the Medical Council, 7th August, 1859.

Candidates having fulfilled the full curriculum are subjected to two professional examinations. Hereafter the preliminary examination must be passed before commencing professional study, and must be otherwise conformable to the regulations of the Medical Council.

School of Medicine, Edinburgh.—The lectures of this School qualify for the University of Edinburgh and the other Universities, and the Royal Colleges of Physicians and Surgeons, Edinburgh, London, and Dublin, and the other medical and surgical boards.

In accordance with the statutes of the University of Edinburgh, any four of the medical classes required for graduation, or two complete *anni medici*, may be studied at this school, each of which may be constituted by attendance on two of the six-months' courses, or on one of these, and two three-months' courses. It is always provided, however, that the fee for any class taken for graduation in the University of Edinburgh shall be the same as that charged by the University for the corresponding class.

The whole of the education required for graduation at the University of London may be taken at this school. The minimum cost of the education of this School of Medicine for the double qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons, including the fees for the joint examination, is £85, which is payable by yearly instalments during the period of study; and the minimum cost for the single qualification of either Physician or Surgeon, including fees for examination, is £85.

Royal Infirmary, Edinburgh.—Clinical instruction is afforded at this institution under the supervision of Professors of the University and ordinary physicians and surgeons to the Infirmary. Special instruction is given on diseases of women, physical diagnosis, and diseases of the eye. Separate wards are devoted to fever, venereal diseases, diseases of women, diseases of the eye, &c. The perpetual fee, in one payment, is £10; the annual fee, £5 5s.; half-yearly, £3 3s.; quarterly, £1 11s. 6d. Separate payments for two years entitle the student to a perpetual ticket. No fees are payable for any surgical or medical appointment.

Glasgow Royal Infirmary School of Medicine.—The Winter Session will commence on October 29th. Courses of lectures are given on all the subjects required by the licensing bodies for qualification, and lectures are also given on Practical Physiology, Operative Surgery, Aural Surgery, Dental Surgery, and Diseases of the Eye. During the summer lectures on Insanity are given by Dr. A. Robertson, and the City Parochial Asylum under his charge is free to students of this school. Students have unusual facilities for the study of anatomy, the supply of subjects being practically unlimited.

Class Fees.—For each course, first session, £2 2s.; second session and perpetual, £1 1s. Students who have attended a first course elsewhere can enter on the second course on payment of £1 1s. Anatomy, first winter session, £4 4s.; summer session, £1 1s.; second winter session, £4 4s.; afterwards the fee for lectures and Practical Anatomy is £1 1s. per session. Lectures on Diseases of the Ear, £1 1s.; with clinique to those who are not students of the hospital, £2 2s. Clinique on Dental Surgery free to students of the hospital, to others £1 1s. Lectures on Diseases of the Eye, £1 1s.

Glasgow Royal Infirmary.—Number of beds, 570. In addition to the ordinary medical and surgical wards, there are separate wards for the treatment of venereal diseases and the diseases of women, whilst diseases of the eye, ear, throat, and teeth are especially treated at the dispensary. Courses of Clinical Medicine and Surgery are given by the physicians and surgeons, and *post-mortem* examinations are conducted in the pathological theatre by the pathologist, who also gives practical instruction in pathological anatomy and histology.

Appointments.—There are five physicians' and five surgeons' assistants. The appointments can be held for six or twelve months, and are open to students who have passed all their examinations except the last, or to gentlemen who have a qualification in medicine or surgery. Clinical assistants, dressers, dispensary clerks, and pathological assistants are selected from the students without additional fees.

Fees for hospital practice and clinical lectures, first year, £10 10s.; second year, £10 10s., afterwards free. For six months, £6 6s.; three months, £4 4s. Students who have paid 20 guineas at another hospital for its perpetual ticket are admitted six months for £2 2s., or one year for £3 3s. Vaccination certificate, recognised by Privy Council, £1 1s.

Anderson's University, Glasgow.—This is exclusively a teaching body. In addition to its offering excellent opportunities for acquiring a good medical education

nstruction is given in the other branches of a liberal education, advantage of which might profitably be taken by medical students generally. The expenses of this institution, as already mentioned, are exceedingly moderate. Extensive opportunities for dissection are offered, under the guidance of the very talented lecturer on anatomy.

Students are admitted to the practice of the Western Infirmary, close to the University, which has about 200 beds, and an excellent staff. Clinical lectures are delivered by the professors at this institution, and at the Royal Infirmary, students having the option of choosing any two whose lectures he will attend.

In connection with this College, there are five hospitals and dispensaries for special diseases, to all of which students are admitted.

The following Scholarships will be competed for at the commencement of Winter Session 1878-79 :—

(1.) A Scholarship, value £20, for students of the College entering upon their *third* winter of medical study.

(2). A Scholarship, value £10, for students of the College entering upon their *second* winter of medical study.

The subjects of examination for the £20 Scholarship will be Anatomy, Physiology, and Surgery. In Anatomy the examination will be limited to the following subjects, viz.:—The Joints, the Minute Anatomy of the Thoracic and Abdominal Viscera, Practical Examination on Recent Dissections. In Physiology the examination will be limited to the Cerebro-Spinal Nervous System. And in Surgery the examination will be limited to Hernia, Dislocations, Fractures, Diseases of the Bones, Aneurism, and Diseases of the Genito-Urinary Organs. The examination will be partly *viva voce* and partly written.

The subjects of examination for the £10 Scholarship will be Anatomy and Chemistry. In Anatomy the examination will be limited to the Bones, Joints, and Muscles. In Chemistry the written examination will be on some subject taken from the Chemistry of the Sugars and Alcohols (Text-book, Armstrong's "Organic Chemistry.") The *viva voce* examination will embrace the Chemistry of the Non-Metallic Elements (Text-book, Wilson's or Williamson's "Chemistry.") There will also be a practical examination, embracing the analysis of a simple salt.

The examinations for the Scholarships will take place in the last week of November, 1878.

In addition to these Scholarships, a prize of £5 will be awarded in the Junior Anatomy Class at the close of the Winter Session, and one of similar value in the Chemistry Class for Students of the First Year.

Further particulars may be obtained on applying to Dr. A. M. Buchanan, Dean of the Medical Faculty.

A Dispensary is now connected with Anderson's College, the leading feature of which is that Students have the privilege of visiting and treating patients at their own homes. In addition, advice is given daily at the Dispensary on all Medical and Surgical diseases, and, once a week, special advice and clinical instruction are given in diseases of women and children. The Students, in visiting cases at their own homes, are assisted (when necessary) by the Dispensary Staff, which consists of twelve Physicians and Surgeons.

HOURS OF THE INTRODUCTORY LECTURES

To be delivered at the Scotch Medical Schools.

University of Edinburgh—Oct. 29th. 2 p.m.—The Principal.
University of Glasgow—Oct. 29th Professor McKendrick, M D.
University of Aberdeen—None. Session commences Oct. 30th.
School of Medicine, Edinburgh—Oct. 29th, 11 a.m.—Dr. Claude Muirhead.
Anderson's University (Glasgow)—Oct 29th, 11 a.m.—Dr. McVail.
Glasgow Royal Infirmary School of Medicine—Oct. 29th—Dr. Wm. Macewen.

NOTICE.

The Editor desires to thank the Deans of the various Medical Schools for supplying him with the information respecting the institutions with which they are connected. [As this number is devoted exclusively to information necessary for students intending to join one or other of the various medical schools; and for those who, having passed their curriculum, are about to enter the ranks of the profession, the ordinary matter which fills our columns is necessarily deferred to next week. Should any of our readers desire to present this number to a patient or friend who contemplates sending his son to a medical college, our Publisher will be happy to supply him with a duplicate free of cost.]

LECTURES ON LOCALISATION IN CEREBRAL DISEASE.

By Prof. CHARCOT, M.D.,

Physician to the Salpetrière Hospital, Member of the Academie de Medicine, Paris; Fellow of the Clinical Society of London, &c., &c.

(*Continued from page* 119.)

IV.—For the anatomy of fasciculated scleroses I refer to a detailed memoir published by Bouchard, but shall only give here certain facts rendered interesting by our studies.

1. I will first remind you that scleroses consequent upon a circumscribed lesion of a cerebral hemisphere affect half of the system of lateral fasciculi. They are more or less well marked, and extensive according to the size of the nervous band, but they always affect its whole length as far as the lower end of the lumbar bulb; they never cease in the course of the band; they are always *descending* in the sense that, originating at the level of the injury, they progress in a direction inferior to this point, and cannot be traced upwards in the direction of the grey cortex. We must not regard as a consecutive sclerosis those atrophies of one or more convolutions, or the whole hemisphere, which are seen when a central lesion occurs in a very young subject. We have then an arrest of development comparable to the atrophy occurring in the limits of the affected side in hemiplegia (spasmodic infantile hemiplegia).

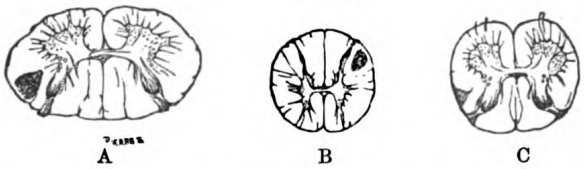
2. Microscopic examination alone, in rather old and well-marked cases, enables us to recognise some of the most striking characteristics of the change. Suppose that there is an ochre-like hæmorrhogic spot in the left hemisphere which cuts off the course of the fibres of the internal capsule in their middle third. In such a case the foot of the crus cerebri of the left side will appear thinner and flatter than that of the right. Moreover, we shall find a greyish band in the central part of the peduncle (crus), which in an antero-posterior section will not be found to extend beyond the grey layer of Sœmering. The grey tint disappears at the edge of the pons, and is again found below it in the medulla, where it occupies the anterior pyramid in its whole length on the same side as the central lesion; the affected pyramid is also narrow and flattened; below, the indentations of the bulbar decussation are more clearly seen than in the normal state, because of the contrast between the sound and affected sides. Below the decussation, in the half of the cord opposite the central lesion, the sclerosis will be found in the lateral column; the morbid part will be found in the form of a triangular space of grey colour, situated directly exterior to and before the posterior cornu, its extent being gradually less, as the sections of the cord are made lower down.

3. Microscopic examination of their sections suitably hardened adds materially to these results. In the first place, it furnishes the means of fixing more exactly the site of the lesion, and of showing that the part of the cord (for example) affected is the lateral column. The other white fasciculi and the grey cornua remain perfectly intact. We are at the same time able to see that the nerve-roots, anterior and posterior, and meninges, show no trace of alteration. Further, minute examination enables us to discover the nature of the morbid process, and indicates grey induration and sclerosis, which does not differ essentially from that seen in primary fasciculated sclerosis.

4. And here let me notice the pathological analogies which exist between the consecutive scleroses of a cerebral origin and the primary fasciculated scleroses, symmetrical also, affecting the lateral columns, which I described last year as spinal amyotrophies. These analogies are considerable, since the same change — grey induration — appears in the same situation in both cases. But there

are differences also to be noticed; for instance, in the primary sclerosis the fascicular lesion is necessarily double, that is to say, it occupies the lateral columns of both sides at once, and not of one side only, as is always the case in consecutive sclerosis, since the centre of diseased action is unilateral. It is always much more extensive transversely, and there is reason to believe that beside the cerebro-spinal or pyramidal nerves affected in consecutive sclerosis, the proper spinal fibres of the lateral column are also involved (figs. 34-39).

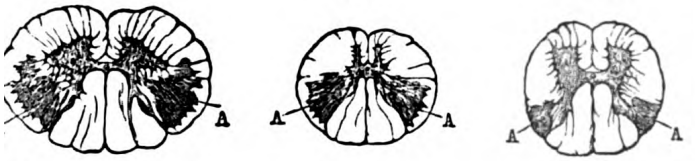
Fig. 34. Fig. 35. Fig. 36.



A B C

Transverse sections of the spinal cord in a case of secondary degeneration (lateral fasciculated sclerosis, consecutive upon cerebral cause) following a cerebral softening, which affected the opto-striate and the internal capsule of the right hemisphere. A, cervical region. B, dorsal region. C, lumbar region. The sclerosis is seen to become superficial as it descends into the lumbar region.

Fig. 37. Fig. 38. Fig. 39.



ansverse section of the spinal cord through the middle of the cervical enlargement.

Transverse section through the middle of the dorsal region.

Transverse section through the middle of the lumbar enlargement.

We find also that primitive sclerosis has a great tendency to invade the neighbouring regions of the cord, both the white fasciculi and the anterior cornua of the grey substance, which is not usually the case with consecutive sclerosis; yet there are, as we shall see, some very interesting exceptions.

V.—We have just been observing that from an anatomical point of view there is considerable analogy between the primary and consecutive forms of lateral sclerosis. The resemblance may also be studied clinically. We know that motor paralysis—contraction of the limbs—at first transitory, then permanent, with spontaneous or provoked trembling, &c., form the group of symptoms which during life reveal the presence of primary spinal sclerosis, that is to say, those which are independent of any central lesion. All these symptoms appear in their essential characters in cases of sclerosis consecutive to brain disease, and constitute, in a word, common permanent hemiplegia. We safely say, then, that between the lesion "lateral sclerosis" and the phenomenon "permanent rigidity," there exists a relation which we cannot account for philosophically at present, although it is clearly proved by a great number of observations. In my opinion, neither retraction of the cerebral cicatrix, as Dr. Todd has said, nor encephalitis arising in the neighbourhood of the clot, as many others maintain, will account for the occurrence of late rigidity in hemiplegic patients; but it is due to the existence of chronic myelitis, arising in the lateral column from the brain lesion. I shall not here regularly discuss this question, but refer you to M. Bouchard's work, in which you will find a collection of documentary evidence in favour of the view which I support.

Arising from a circumscribed cerebral lesion, consecutive sclerosis acquires, as you see, at a certain point, an independent autonomous existence, and is revealed by special symptoms. It may happen that by reason of that autonomy the lesion spreads beyond the limits usually assigned to it in the lateral columns, and invades the neighbouring parts of the cord, the cornua of the grey matter for example. In such cases, of course, the symptoms will manifest considerable modifications; it is in this way that the muscles of the paralysed limbs, which usually in permanent hemiplegia preserve their normal texture for a long time, and do not emaciate, in certain cases undergo a more or less rapid degenerative atrophy, while the rigidity gives place to flaccidity. In many examples of this kind, we have found, M. Pienet and I, beside the classic lateral sclerosis, a lesion of the grey anterior cornu of the same side, having induced destruction of the large nerve-cells of the part. The invasion of the grey posterior cornua may explain in the same way the appearance of certain partial anæsthesiæ, in common hemiplegia. And the extension of the irritative process, whether through the whole length of the lateral column of that side or of the lateral column of the other side, will doubtless account for the fact that contrary to common observation, contraction sometimes prevails in the leg, and sometimes in the leg of the other side.

VI.—I have been occupied hitherto in showing that fascicular sclerosis of cerebral origin depends on lesion of the central masses; I wish now to linger for a moment on the results of a cortical lesion. Lateral sclerosis arising from spinal lesions does not materially differ from that which arises in the medulla oblongata. The conditions of development are the only difference, and these demand some fresh details.

You remember that we have been led, by a very probable hypothesis, to believe in the existence of *direct peduncular fibres*, which, after issuing from the foot of the crus, traverse the internal capsule without entering the grey nuclei of the central masses, and consequently stop only in the grey cortical matter; besides the arguments already adduced, some experimental facts may also be appealed to in favour of the existence of such fibres, even in animals placed low in the scale, the rabbit for example. Thus in M. Gudden's experiments, carried on, as we know, in very young animals, it has been found eight months after the removal of the anterior parts of the hemisphere (the corpus striatum, thalamus, and central masses being left intact) that the internal capsule of that side is remarkably atrophied. It is clear that that atrophy would not have taken place if the internal capsule, as some anatomists say, were made up exclusively of *indirect peduncular fibres*, that is to say, fibres which terminate in the grey cortical nuclei. In the dog, Carville and Duret have chanced to discover a lesion which had destroyed the white substance of the frontal part of a lobe, without affecting directly either the central nuclei or the internal capsule. In this case there was well marked atrophy of the foot of the crus, of the pons, and of the pyramid on the side of the medulla corresponding to the cerebral lesion.

The actual existence of the direct peduncular fibres in man seems to be proved by the production of these secondary degenerations, which, as we have said, arise in consequence of deep and extensive lesions of the grey cortical matter.

These direct peduncular fibres, after spreading out in the cornu radiata, spread also indefinitely in all parts of the hemisphere. Are they directed to special parts of the grey cortical matter? The facts which I have gathered for the purpose of studying this question are in favour of the second hypothesis. My observations, made in my clinique at the Salpétrière in the course of the last fifteen years, relate to cases of old ischæmic softening. The lesion in these cases appeared in the form of the yellow patches, more or less extensive, and affecting the subjacent white matter to a variable depth, and occupying different regions of the surface of the hemispheres. In all these observations it is clearly stated that the softening had not affected the central masses,

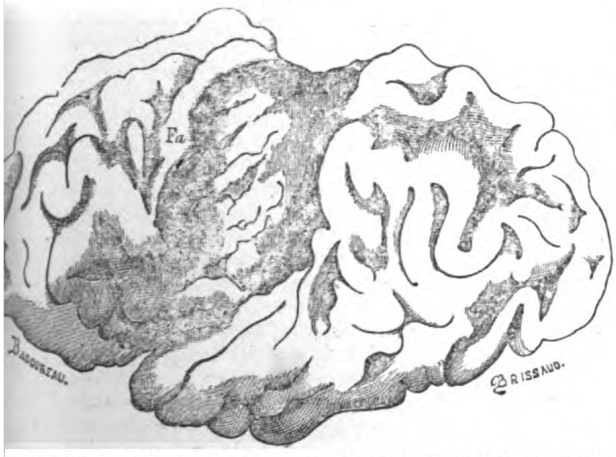
the thalami, caudate and lenticular nuclei, and internal capsule.

My observations may be drawn up in two groups.

The first comprises those cases in which, during life, permanent hemiplegia has not existed, and where the autopsy has failed to discover consecutive degeneration. In all, the convolutions by the Sylvian artery, and especially the ascending frontal and parietal convolutions, remained unhurt. The yellow patches were found in one or other of the following parts: some portion of the sphenoidal lobes, the square lobe, the corner, one or both of the occipital lobes, any part of the anterior two thirds of the frontal lobes.

In all the cases of the second group there has been permanent hemiplegia, and well-marked consecutive sclerosis. The common characteristic of these cases is that the lesion has affected (more or less) either one or both of the ascending frontal and parietal convolutions in the upper half chiefly. And besides this, there has usually been affection of the adjoining parts of the frontal and parietal convolutions. The annexed woodcut represents a good instance of this kind of lesion (fig. 40).

Fig. 40.



arge centre of cortical softening, which has destroyed the ascending rietal convolution, a great part of the ascending frontal convolution, and st of the convolution of the insula. The central masses were not ected.

From what has now been stated, you will perceive that the production of scleroses in consequence of destructive lesions of the cortical matter of the hemispheres, depends much on the position of these latter lesions. I would have you notice, in conclusion, that the cortical regions in which destructive changes will bring about secondary degenerations, correspond to those which have been shown by experiments on monkeys to include the *psycho-motor* centres, and they are the parts where the grey cortical matter contains the largest pyramidal cells.

I have now brought forward an important fact which ought to be of use in the study of localisation in the cortical system of the hemispheres, the difficult study which will occupy the next lessons.

In the principal foreign cities the rates of mortality, according to the most recent weekly returns, were: in Calcutta 31, Bombay 34, Madras 36; Paris 20; Geneva 19; Brussels 24; Amsterdam 20, Rotterdam 22, The Hague 22; Copenhagen 23; Stockholm 25; St. Petersburgh 37; Berlin 30, Hamburg 25, Dresden 27, Breslau 28, Munich 36; Vienna 24, Buda-Pesth 35; Rome 20, Turin 24, Venice 21; Alexandria 66; New York 27, Brooklyn 23, Philadelphia 17, and Baltimore 19.

THE MECHANICAL SYSTEM OF UTERINE PATHOLOGY.

By GRAILY HEWITT, M.D. Lond. F.R.C.P.,
President of the Harveian Society, &c., &c.

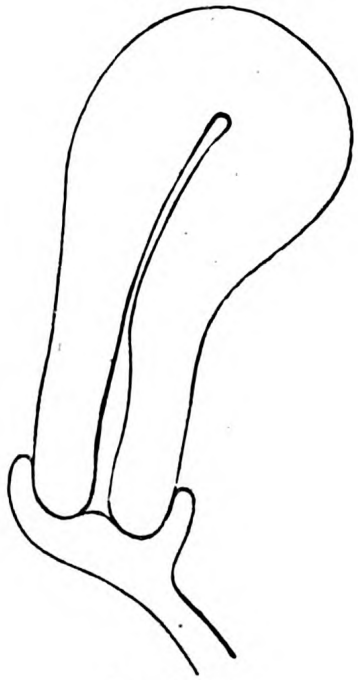
LECTURE II.

(*Continued from page* 199.)

RELATION OF THE VARIOUS UTERINE SYMPTOMS TO THE VARIOUS PHYSICAL OR OTHER CHANGES OBSERVED IN THE UTERUS.

The physical change in the uterus to which experience has led me to assign the greatest importance is *change of shape* of the uterus. Observation has convinced me that this is the most common and the most troublesome of the maladies to which the uterus is liable. Cases, many in number, which have come under my notice during past years have told one and the same story; almost every new case that presents itself contains proof of the accuracy of the idea in question. *Change of position* of the uterus, another physical alteration, is necessarily associated with the change of shape, for change of shape implies change of position more or less, and it is an exceedingly important element. Change of position may be unassociated with change of shape, and may be important or not according to circumstances which I shall hope by-and-by more accurately to define. But at this moment attention is directed particularly to the change of shape.

Fig. 14.



Normal uterus.

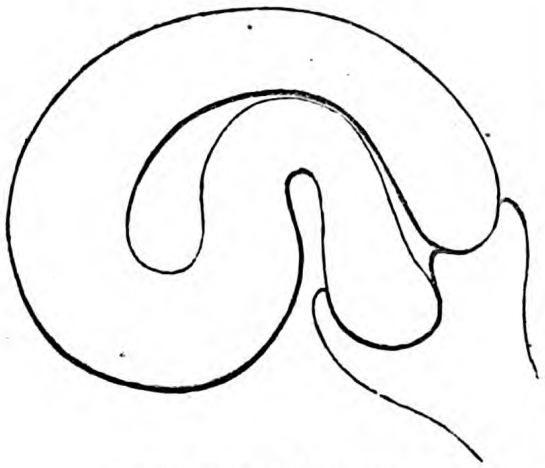
Let us consider for a moment the *normal form of th uterus*. The all-wise Artificer of the human frame has given this organ of the body a certain definite form and outline, and has provided it with means for preserving that outline and shape under the ordinary circumstances of life. The form which the uterus possesses is, of course, the best that is possible in view of various physiological requirements, particularly the provision that is made for its enormous expansion and growth during pregnancy. Are we to assume that the preservation of this natural form and shape is a matter of indifference? Are we to suppose that it is a matter of no moment that the uterus should be distorted to such an extent that it is actually doubled on itself, presenting a contracted, shapeless mass? We regard beauty and regularity of the external

form of the body as signs of health, and to a remarkable extent it is found that external beauty and health are associated. Are we to imagine that an organ such as the uterus, exquisitely built and fashioned, and adapted for various purposes, can have its form and outline altered and distorted, and yet that it should continue to be capable of carrying on healthily and satisfactorily the exceedingly important functions with which it is entrusted in the human economy? These considerations alone would enable us *à priori* to anticipate inconveniences and disasters from such a spoiling of Nature's handiwork.

Pain.

The first uterine symptom which it is necessary to analyse is *pain.* An attentive consideration of the various kinds and degrees of pain felt by patients suffering from uterine disease affords information of the most valuable kind. It is very frequently, indeed, the case that patients consult us solely because they are suffering from pain or uneasiness. They are affected with certain unpleasant sensations from which they desire to be relieved. The relation of pain to various uterine diseases deserves, therefore, particular notice. We have been too much in the habit of disregarding pain as pain. For the most part the presence of pain, when it has been admitted that pain is actual and not imaginary, has been regarded as

FIG. 15.



Severe retroflexion of the uterus.

evidence either that the patient is suffering from "inflammation," or from what is termed "neuralgia." To speak plainly, these names are little more than convenient terms used to disguise ignorance. These terms, as applied to diseases of the uterus, have done service for a long time, but they will no longer fulfil the demands of an exact scientific nosology. It is necessary to trace these pains more definitely to their source.

Speaking of pain referable to the uterus, it may be said generally that it is either (1) *spontaneous*, occurring, that is to say, when the patient is at rest; or (2), *it is produced by motion of the body or exertion.* There is a third kind of pain—viz., that produced by touching the uterus, itself—abnormal sensitiveness. The latter phenomenon can only be appreciated when it happens that an examination is made. These several manifestations may be all present together, or they may be observed separately.

Now, the remarkable result is made evident by careful clinical observation, that change of shape or position of the uterus is the particular alteration with which these pains or painful manifestations are most frequently associated. And it can be shown that, judged by this standard alone—viz., the extent to which painful sensations are produced—the distortions and displacements of the uterus have a very great practical importance. This is, however, not a matter to be disposed of in a sentence; details must be entered into.

1. *Spontaneous pain.*—In the first place, we may discuss what has above been termed spontaneous pain referable to the uterus. This kind of pain is not common. Cancer of the uterus, fibroid tumours, or growths of a fibroid nature within the uterus, may give rise to pain of this character. As is well known, pain referable to the uterus is not generally felt in the uterus itself, but either in the back or front of the pelvis. A favourite position is also one or other of the groins. The uterine spasm—uterine colic, as it has been termed—is felt, or may be felt, both in the back and in the uterine region also. Another condition which ought to be added to the above is pain due to the commencement of acute pelvic inflammation, but this scarcely comes within the limits of the present discussion. Morbid conditions of the bladder, rectum, &c., are of course liable to occasion pain of spontaneous character; but these are cases not coming into notice from our present point of view. Lastly, it must be stated that in certain very severe cases of uterine distortion, accompanied with considerable congestion and irritation internally, spontaneous pain may be observed. Apart from the presence of one or other of these conditions, spontaneous pain is not often witnessed.

2. *Pain on motion.*—The pains referable to the uterus, and produced by motion or by certain positions of the body, are, however, most common; and cases in which such pains are observed are very numerous. It is a singular fact that this very important symptom of uterine disease has attracted so little notice at the hands of uterine pathologists. It is so common a symptom that it is worthy of a special designation. Writing on this subject some years ago, I ventured to characterise the marked cases of this kind as cases of "uterine lameness." This designation is not a very satisfactory one, and, after consideration, I now propose "uterine dyskinesia" as a term better suited for the purpose. I think it will be admitted, on considering the facts of the case, that the introduction of such a term into familiar medical nosology will be likely to be attended with beneficial results. By uterine dyskinesia, then, is meant an inability on the part of the patient to move about, to walk, or to make various exertions, without experiencing pain more or less severe.
